expected to reap from it are not yet theirs. They are still poor, they have still to work hard, they are still uncertain whether they will at all times have work to do. To men in this temper M. ROCHEFORT's address comes like a gospel. There is no need, he says, to despair of the Republic, because you have never yet had a real Republic. The real Republic is the Republic of the poor; what you have been living under till now is a Republic of the rich. Instead of losing faith in Republican forms, bestir yourselves to make them instinct with the true Republican spirit, and then you will find your wrongs redressed and your sufferings removed. There is no need to have recourse to physical violence in order to bring this end about. Universal suffrage belongs to you as much as to the Opportunists. When the whole framework of the Government has to be altered, violence may be unavoidable; kings and emperors rarely submit to be banished without offering some resistance. In France they are no longer there to resist. The places are all right, and it is only the men who sit in them that need changing. The field for a Socialist Republican is the next general election. Universal suffrage ought to give whatever answer the poor desire, because the majority of voters are themselves poor. The very fact, however, that the Socialist Republicans are poor is a reason in M. ROCHEFORT's eyes for not trusting too exclusively to the proletariat to furnish leaders. Here and there one may arise; but for the most part they must be looked for among men who have more leisure, more means, and more personal ambition. M. ROCHEFORT knows that, if he can persuade the proletariat to let him choose his lieutenants from among lawyers and men of letters, he can find as many as he wants. It is for this reason, probably, that he is so anxious to have men judged by their actions rather than by their social antecedents. A proletariat, guided by politicians like himself, is, as he justly thinks, far more dangerous than a proletariat which has to take its chiefs from among its own ranks.

MR. DODSON AND VACCINATION.

THE public will be thankful to learn that, whatever may be thought of Mr. DODSON's theory of vaccination, his practice is beyond impeachment. Disastrous as the next outbreak of small-pox may prove, we may look forward with reasonable confidence to having the PRESIDENT of the LOCAL GOVERNMENT BOARD spared to us. For modes of enforcing the law let graceless doctors fight; he can't be wrong who has been repeatedly re-vaccinated. Mr. DODSON was able, when the deputation from the British Medical Association waited on him last Monday, to offer his own person as the best proof he could give of the importance he attaches to the precaution he is suspected of undervaluing. We can picture him laying aside his coat, and rolling up his shirt-sleeves, while the members of the deputation were addressing him, and then pointing with mild reproach to his scarred arms as evidence of what he had suffered in the good cause. Nor is it only in his own person that he has borne his testimony. He can say not only "As for me," but "As for me and my house," we have all been re-vaccinated.

It is naturally painful to a man who has fought the good fight in this way to have his orthodoxy questioned, and it may be admitted that he made out as good a case as he could for the provisions of his Bill. When all has been said, however, that can be said, it comes to very little. No analogy is absolutely perfect, and the expedient to which Mr. DODSON most resorted was to deny that to forego all prosecutions for non-vaccination of children after one penalty of 20s. has been inflicted is the same thing as to allow an indulgence for drunkenness to be bought for money. "Taking out a licence," he says, "is not "the same thing as submitting to a money penalty." That is true, nor, so far as we know, has any one ever contended that it is the same thing; what has been said is that it is very nearly the same thing—that, whatever may be the original difference between the ideas, it is impossible to separate them when once it has been established that to submit to a single money payment carries with it the same results as taking out a licence. No doubt it is pleasanter to go to the nearest Post-office and take out a licence to use armorial bearings than to be brought up before a magistrate and sentenced to pay a fine. But when it comes to be understood that the result is precisely the same in the two cases—that when once the money has been paid, either to the postmaster or to the magistrate's clerk, all fear of further annoyance is equally at an end, that the man who can prove that he has once been fined 20s. stands in the same position as the man who can prove that he has paid 20s. for his licence—even the less pleasant process will be deprived of most of its terrors. At present there is at least the motive for alarm which is supplied by a sense of uncertainty. The man who omits to have his child vaccinated does not know what amount of inconvenience his obstinacy may not entail upon him. There is a prospect of many fines coming one after another, and there is the possibility that refusal to pay the fines may in the end land him in prison. Mr. DODSON's plea—the plea usually put forward for relaxing a law which is disagreeable to fanatics—is that it is unwise to multiply martyrs. No doubt in themselves martyrs are inconvenient things. They draw to themselves a certain amount of sympathy and make disobedience to the law interesting. But what proof has Mr. DODSON to offer that, if his Bill is passed, the number of children remaining unvaccinated will not be greater by reason of the immunity which will then be accorded to parents than it is already by reason of the feeling excited by martyrdoms? Let us suppose, for example, that a hundred parents are now made martyrs every year, and that each martyr is the seed of five members of the Anti-Vaccination Church. Before it can be determined that it would be wiser not to make these hundred martyrs, it must be considered how many children are likely to go unvaccinated if these hundred parents are let off with a penalty of 1*l.* each. If the impunity thus ostentatiously accorded in return for a small money payment leads a thousand parents to break the law, where will be the gain of not making martyrs of the hundred?

It must not be forgotten that there are many motives which lead to the neglect of vaccination among the poor besides the determined defiance of the law which is displayed only here and there. It is a burden to take the child to the doctor, and to have it more or less ailing for some days afterwards; or the parent, without being really convinced by the arguments of the anti-vaccinationists, thinks there may be something in what they say, and is at all events only prevented from leaving things alone by the fear that he will get into trouble. Take this fear entirely away, and the child will almost certainly go unvaccinated. Take this fear away in part, and the child will probably go unvaccinated. Leave the law as it is, and the parent, not knowing exactly what amount of inconvenience his neglect may bring upon him, will almost certainly put his doubts in his pocket and take the child to the doctor. Mr. DODSON entirely mistakes the objection to his Bill when he argues that to fine a man thirty times, and not to get the child vaccinated after all, is to bring the law into disrepute. The real question is not so much what the man who is fined thirty times will do, as what the man who dislikes being fined, but can put up with it for once, is likely to do. Can there be any doubt that such a man will be more careless about obeying the law when he knows that the worst that can happen to him is to have to make his appearance before the magistrates once and to pay a sovereign, than he will be if he knows that he may have to make thirty appearances before the magistrates and to pay 30*l.* for the pleasure of seeing his child die of small-pox in the end? The sole consideration in a matter of this kind is what kind of provisions are most calculated to get vaccination attended to as a rule. If Mr. DODSON will imagine himself a parent, with a vague prejudice against vaccination, but no desire to be a martyr, he will have no difficulty in answering this question for himself. There is no necessity to make the law more severe than it is. In theory, of course, it would be more consistent to vaccinate children by force; but this might have the result which Mr. DODSON wrongly attributes to the existing law, and create an active sympathy for the aggrieved parent which would defeat its own end. All that seems to be wanted is a vigorous application of the law as it stands. The child at present is not taken from the parent, but the parent's comfort is very seriously interfered with. The summons, the trial, and the penalty are always hanging over his head, and every now and then they fall. He himself may be sustained by his virtue or by the sympathy and subscriptions of his friends; but his position will not be romantic enough to make others anxious to share it, and in the great majority of cases they may be trusted to

take care that they do not share it. If for this constant liability to annoyance there is substituted a single money payment, this resolution will be very seriously weakened. Disobedience to the law will entail a certain saving of trouble, against which there will be nothing to be set, except the not tremendous possibility of having to pay 20s. If Mr. DODSON's Bill becomes law, vaccination will more and more be confined to those who have an active belief in its efficacy.

BATH ABBEY.

AT first sight there seems no reason why the diocese of Bath and Wells should not, like the neighbouring see of Gloucester and Bristol, be honoured with two episcopal chairs. Accordingly, we have known even fairly intelligent Churchmen disappointed at not finding a description of Bath Abbey in Murray's *English Cathedrals*. As the latest pre-Reformation form of St. Peter's, Bath, was that of a cathedral church, and the structure stands architecturally unchanged, we are not sure that its inclusion in the *Handbook* would not have been as excusable as its omission. But perhaps the information in question will more naturally appear in a future edition of Murray's work, for it would be only in keeping with the well-known repetitions of history that Bath should again become a fold under its own shepherd. The leading title in an episcopate which has yielded among its dignitaries two cardinals, eight archbishops, six lord chancellors, and eight lord high treasurers, we can hardly understand that so ancient and honourable a city should, in this age of the formation of new bishoprics and revival of old, accept for the final condition of its chief ecclesiastical building, the reduced standing of a parish church. Unlike Wells, which has always been served by secular canons and never by monks, Bath has been the subject of as many changes of constitution as there have been monastic or anti-monastic movements and mutations in the English Church. The first ecclesiastical transformation was from a Pagan temple to a Christian convent. With clearer evidence than that St. Paul's Cathedral succeeded a temple to Diana, it may be shown that Minerva presided over the hot springs of *Aquae Solis*, and that a temple to her worship stretched its architrave within the precincts of the existing abbey. A visitor at the present time to the Waters of the Sun may see some recently excavated foundations of the original Roman baths, which are the only constructive relics of the "arcades of stone whence" (according to a Saxon poem, edited by the Rev. John Earle) "the streams hotly issued" until the fires went out in Minerva's fane. How far the materials of the Roman temple subserved to the erection (A.D. 676) of the Christian nunnery by Osric, King, or sub-regulus, of the Wiccias, is not certain, especially as the charter of Osric, as a genuine and unaltered document, is received with suspicion. At any rate, if we are to believe Leland, who seems to have gathered his information from the prior of the later house, the "monastery of Holy Virgins" which Bertana, the first abbess, had been enabled to build by the grant of the lands of one hundred villeins, was entirely destroyed by the inevitable Danes. As the English Chronicle states that the first ships of the Northmen appeared on the English coast in 787, Leland was probably mistaken in referring to an earlier date the destruction of Bertana's nunnery to these people. It was, however, superseded by Offa, King of the Mercians, whose many ecclesiastical works must have cost him almost as much as the famous dyke by which they were protected. In keeping with the spirit of his time, when the celibate rule was not practised, Offa here in 775 erected a church to St. Peter, in connexion with a college for secular canons, who married and gave in marriage, and chanted their litanies till the flood of Benedictinism came and swept them all away. This, of course, happened in the days of Edgar, a prince whose character, when depicted by the monkish biographer, displays as many saintly glories as a minster window, and who certainly had only less reverence for chastity in Churchmen than contempt for that virtue in his own practice. Edgar having displaced (A.D. 970) the seculars in favour of a convent of Benedictine regulars, Alphege, afterwards Archbishop of Canterbury, and canonized martyr, was appointed the first abbot. Three years later Edgar, either on account of the greatness of the church, or the greatness of the city, or the importance of both together, chose the convent minster of Bath for the place of his coronation, being therein hallowed King in the presence of Oswald, Archbishop of York, and a "heap" of other prelates, priests, and monks. During many centuries it was customary at Whitsuntide, according to Leland, for the townsmen to elect a king among themselves in memory of Edgar's coronation, the richest men of the place feasting the ephemeral monarch and his retinue, who, in all their ceremonies, were expected to pray for King Edgar's soul. Whether Beau Nash and other potentates of fashion as "Kings of Bath" were successors of these pentecostal sovereigns, as has been thought, requires more research to certify than we can afford.

At the date of the Conquest, Bath was the capital of Somerset, being the seat of the *summa justicia*, or highest Crown court in the county. This mark of royalty was derived from Edward the Confessor, who, at his accession, bestowed the burgh upon his wife, Edith; the Queen herself, says Mr. Eyton in his lately published Domesday of Somerset, thenceforward exercising "the function of a high justiciar." Bath was alienated from the Crown by William Rufus, who first of all by a charter dated 1090 gave the abbey to John de Villula, or John of Tours, as he is otherwise named; and by a second charter Rufus granted the whole city of Bath in free alms to the same prelate and his successors, to be held in as independent a manner as the King himself held any city in England, that with greater honour he might there fix his pontifical seat. About this time it was ordained that to increase the territorial influence of the Church certain bishoprics should be transplanted from the smaller towns to places of more importance. Bath was a walled city when Wells, which was never enclosed, was a mere village. If the comparative magnitude and stateliness of the towns were a sufficient reason, and the architectural grandeur of St. Andrew's Cathedral were less, Bath might again properly enjoy the dignity procured her by John de Villula, the first Bishop of Somerset, who, forsaking his seat at Wells, became Abbot of Bath, making the fane of St. Peter there his cathedral church, and its prior and monks his chapter. The Abbey of Bath was thus united (A.D. 1091) with the Somersetshire diocese; and as spiritual and temporal lord of his newly adopted city John of Tours preferred to be called Bishop of Bath only, removing the title of Wells. Under this style he declares in his charter that "the head and mother church of the bishopric of Somerset shall be in the city of Bath in the church of St. Peter, to which holy apostle," he says, "and the monks his servants I have restored their lands." Bishop John rebuilt the church in grander form, and lavishly enriched it with eucharistic ornaments. He is also said to have enriched it with men of literary ability, but their works, if any, seem to have perished like his own structure. After reigning with no great mildness thirty-four years he died (A.D. 1123), and was buried in his cathedral. Leland saw his effigied tomb in the midst of the presbytery, at "which time" (c. A.D. 1534) "all the church that he made lay to waste and was unroofed, and weeds grew about this John of Tour's sepulchre." In magnitude De Villula's church probably surpassed the Norman cathedral at Wells, and was certainly so much larger than the existing Abbey at Bath, that the latter represents only its nave with a further bay. It stretched about a bay short of the present west end, but its eastern limb extended as far as the Literary Institution garden. The bases of the pillars of the Romanesque church may yet be seen about six or eight feet below the level of the present building; and the arch between the south aisle and that aisle and the south transept is still evident at the east end. The great era of church building in the neighbourhood set in during the bishopric of John of Tours, or within a few years of that epoch; and examples of Norman structures more or less exist at Swainswick, Charlcomb, Langridge, Tuerton, and Englishcomb. The last named, the most beautiful of all, the Rev. John Earle argues to be a miniature model of the Romanesque abbey.

The removal of the *bishopstool* from Wells to Bath had been in opposition to the canons of the former foundation, who protested long and vigorously against the wrong done to themselves. To end the discord, Robert, the third Bishop of Bath, who succeeded to that title in 1137, decreed that the bishops should henceforth be installed both at Bath and at Wells, and should take their title from the joint names of those places, Bath being first. The arrangement, however, had been without the confirmation of a Papal Bull, a powerful sanction that was not wanting in the subsequent and even more serious case in which the great abbey in the neighbouring valley of Glastonbury became annexed to the diocese. At the close of the thirteenth century that rich Benedictine monastery was gaining the height of its architectural and conventual splendour. To bring into union the three important churches of Glastonbury, Wells, and Bath, and to become himself bishop and abbot of the joint foundations was the ambition of Savaric, who obtained the episcopate of the two latter places in 1192. So splendid a piece of plurality was almost worth a king's ransom, and it is a curious fact that the Abbey of Glastonbury actually formed part of the ransom of Richard the Lion-heart from the hands of Leopold of Austria. Savaric was a relation of the latter potentate, whom he persuaded to exact from the royal captive the grant of Glastonbury as an item of the great price demanded for his deliverance. This transaction was entirely without the knowledge and consent of the monks, who had been bought and sold with their abbey, though it was not without the connivance of Henry de Suliaco, their abbot, who in order to create the required vacancy for Savaric, accepted from Richard the bishop's throne of Worcester. In return for the dignified gift of Glastonbury, Savaric gave back to the crown the city of Bath, worth 100 marks a year, which his predecessor John of Tours had purchased; and transferring the episcopal seat to the former place, styled himself Bishop of Bath and Glastonbury till his death in 1205, a title that was continued by his successor, Reginald Fitz-Joceline. It would require the pen of an ecclesiastical Homer to tell the story of the pious rage and unrelenting indignation of the Avalonian monks, who during twenty-three years were constrained to be represented as the section of a bishopric rather than as the brotherhood of a noble and independent monastery. To bring them to obedience some were excommunicated, some stripped and scourged, some imprisoned, while others were starved into submission by being stinted on one day to meat without drink, and on the next to drink without meat. At length (A.D. 1218), the contention ended by a dissolution of the union between Glastonbury and Bath, liberty being at the same time restored to the monks of the latter place to elect their

own chief. Had these been content with a bishop for their abbot the see of Glastonbury might possibly have survived the sixteenth century, and we should not have to regret that one of the chief Gothic buildings in England should, instead of being a cathedral minster, with all its honourable traditions thick about it, and also the centre of a lively city which it had created, have been reduced to a few roofless and fragmentary walls.

King John, who had confirmed Savaric in his bold appropriation of Glastonbury, further benefited the see of Bath and Wells by according to the monks of the one place, and to the canons of the other, the right of holding ordeals of fire and water, and the privilege of trying in their own courts malefactors taken on their lands, and condemning them, if they thought fit, to the gallows. It appears there was even yet one prerogative wanting to the content of the monks of Bath, whose ears were assailed by the chiming of the bells of the city churches before they had arisen to matins, and after they had retired to their dormitory. During the time of Prior John de Telesford (*ob.* 1425) there was much strong feeling displayed on the part of the convent against the town on account of this evil custom. After some years' dispute it was decreed at an inquisition held at Frome (9 Hen. V.) "that no one should ring any bells within the precincts of Bath in the daytime before the prior had rung his bells; nor in the nighttime after the Prior had rung his curfew."

Wood in his *Description of Bath* states that the weaver's shuttle was formerly added to the arms of the Abbey as "a trophy of the industry of the monks." The arms at present show no sign of a shuttle; but the reader of Chaucer will be prepared to learn that the art of weaving was practised at Bath in the days of the pilgrimage from the "Tabard." The Bath looms were once as celebrated as are now Bath buns, and the manufacture of the best cloth is still carried out at Tuerton, in the neighbourhood. We are told by Warner in his *History of Bath* that, under the auspices of the monks of that city, the woollen manufacture was established around the abbey soon after its introduction into England in A.D. 1333. The goodwife of Bath was herself so skilled a cloth-worker as to be able to pass off her wares as having come from the fine looms of Ypres and Ghent. It is curious to notice how much rationalistic opinion had advanced within about half a century from the time when the holy martyr's shrine at Canterbury was visited by that worthy woman in her fine headdress and scarlet hosen. In 1459, Agnes Cole, wife of Thomas Cole of Bath, was charged with having boldly declared that "it was but waste to give to the Holy Trinity at Bath, and equally absurd to go on pilgrimage to St. Osmund at Salisbury; and that she wished the road thither was choaked up with bremmel (brambles) to lette (hinder) people going thither." It is not surprising that for the utterance of such outrageous doctrine Mistress Cole was sentenced to do penance in the abbey church.

By the neglect of the monks, or rather of the bishops, who, after Roger (*ob.* 1247) preferred to live at Wells, the Church of John of Tours was suffered to fall to decay, and, notwithstanding repairs and partial restoration, the Romanesque building, it is said, had by the close of the fifteenth century become so ruinous as to need to be replaced by a new structure. This great work, one of the latest specimens of historical Perpendicular, was begun in 1499 by Bishop Oliver King, who was principal Secretary of State to Edward IV. He has commemorated his achievement by a sculptured representation, on the west front, of Jacob's vision of angels, which not only caused the original dreamer to raise a pillar at Haran, but, by being dreamed again by Bishop King, caused the erection of Bath Abbey. The addition of an olive tree at the foot of the ladders and of the likeness of a kingly crown at the top is of course an adaptation of the parable of the trees choosing their king, which has served in the design for a fair pun on the good prelate's name. He died in 1503, the work of construction being carried on by Prior Birde and his successors until the time of the surrender of the monastery on June 27, 1539. By an Act of Parliament in 1543, Wells was made the sole chapter of the Somersetshire bishopric. The burgesses having refused the offer of the incomplete fabric of the church for 500 marks, it came by purchase to Humphrey Colles, who sold it (1542) to Matthew Colthurst, whose son Edmund, with more munificence than the rest of the citizens together, made a present of it to the city, of which it has since remained the mother church. The choir was not consecrated until Elizabeth's reign, the nave being even then unfinished, Bishop Montague completing this about 1609. The priory buildings stood on the south side of the conventual church. On their removal at the beginning of the present century it curiously happened that the revestry, which had been walled up at the dissolution, when again opened, disclosed the copes, albs, chasubles, and other garments of the priests and monks still hung round the walls. On contact with the air they crumbled into powder, like the long buried body of the King, found lying with his urns and ornaments.

The plan of the church is a simple Latin cross with a central tower; but Wood, the famous Bath architect of the last century, found a figurative meaning in its design, and the ingenuity of his interpretation of the mystery might have almost entitled him to give an opinion also on our great inheritance in the Pyramids. He discovers that under "a Gothic dress" it bears the quadruple proportions of an Egyptian hall, of Noah's Ark, of Solomon's Temple, and of the Jewish Tabernacle. The nave being divisible into six squares agrees with the Ark, the triple square of the whole church corresponds with the Temple of Solomon, and in the transepts of two and a half squares we have the Tabernacle. A less remote illustration would have been Redcliff Church, which perhaps the architect of the abbey studied even more than Eastern types. It is true the storied magnificence of Redcliff is but imperfectly imitated; but we have the lofty and rapidly succeeding clerestory windows, filling the spaces between the flying buttresses, with tracery almost identical in design to that of Redcliff, the narrow transept, with its deep and high window, being also repeated. In Redcliff, the Third Pointed style reached perfection. Bath Abbey, with its four centred pier arches, and their rather poor capitals and broad and shallow ogee mouldings, shows marks of the decline that had set in long before its erection. But there is much to admire in the church, not the least satisfactory portion of the exterior being the west front, which Mr. Freeman calls an "honest front," as not outgrowing constructive necessity and being a true ending to the nave and aisles. Wells, with its storied tabernacles for the display of statuary, is like a magnificent reredos, which in reduced proportions would be more appropriate to the high altar, where its imagery would be safe from the corroding atmosphere. In Bath, with its turrets and battlements, transomed window and moderate ornament, we have both dignity and simplicity. Sir Gilbert Scott's restoration of the fabric was effected before the S. P. A. B. had begun its system of protests, or there would have been some not unreasonable resistance to the destruction of the coved plaster ceiling of Bishop Montague, which has been replaced by a fan-traceried vaulting in continuation of that of the choir. Its loss, however, is compensated by the true architectural character of the new roof, which will become historical without the inferiority of material that would endanger its retention under the most corrupt restoration of future centuries.

A NEW COMMITTEE OF PUBLIC SAFETY.

SINCE *The Shortest Way with the Dissenters*, it is doubtful whether a more audacious and successful hoax of the political kind has been played than the letter of "A Correspondent" which the *Pall Mall Gazette* printed on Wednesday last. The *Pall Mall Gazette*, it may be remembered, has more than once expressed its dissatisfaction with the conduct of public affairs, and with the slight signs of "getting forrarder" which the Liberal majority at present shows. The vigorous politicians whose organ our contemporary is are disgusted with these dilatory ways. They suggested in the columns of the *Pall Mall* that Mr. Gladstone should manipulate the constituencies so as to give himself a majority still larger and still more subservient; and they developed an ingenious theory of the duty of Parliament to sanction legislation, but not to legislate. Of these utterances the wicked Correspondent—a correspondent never to be sufficiently reprobated—has taken a base advantage. He excogitated and forwarded to the *Pall Mall Gazette* one of the choicest specimens of the grave *reductio ad absurdum* that we remember, always with the exception of Defoe's famous pamphlet, which doubtless inspired him. It begins most plausibly, and in accordance with the best precedents. "In view of the antagonism in prospect between the two branches of the Legislature on the Compensation for Disturbance Bill, it has been decided to convene at an early date a preliminary meeting in support of the Government." Clearly there is nothing improbable in this. On the contrary, the famous meeting in St. James's Hall four years ago, and that assembly at Birmingham which won from a profligate populace the title of "Collings the Afghan" for a respected member of the present Parliament, are cases quite in point. But the Committee which has been formed (on the Correspondent's authority) for this purpose has a soul considerably above such temporary work. It proposes to invite representatives of all Liberal Associations—the pure and patriotic Associations which have recently come under the notice of the Judges at Chester—to discuss the best method of securing "the following objects." The following objects are four. The first is a vote of confidence to console the Government for the rejection—a rejection, by the way, which is purely speculative—of the Disturbance Bill by the Lords. Secondly comes "an expression of opinion in favour of abolishing hereditary peerages and creating a Senate in harmony with the national will." Thirdly, there is to be formed a Committee of electors in permanent Session against the "possible immeasurable calamity" of a return, however temporary, of the Tories to power. Fourthly, there is to be set on foot an agitation to put down "the organized obstruction in the House of Commons, amounting to a rebellion against the national will recently expressed at the hustings." There are no hustings, by the way, now, but that is a trifle. The Committee, says this shameless hoaxer of a correspondent, will meet early next week to organize meetings throughout the kingdom—a reactionary term which shows his bad faith of itself. "Members of Parliament," it seems, "will not be admitted." Nor is this merely a piece of social exclusiveness, like that which led a crack Australian corps of mounted police to advertise that no younger sons of viscounts nor masters of arts of one of the universities would be admitted into their ranks. The exclusion is based, as a moment's thought will show, upon the soundest principles. The object of the movement is to reduce members of Parliament to the position of puppets, with a *mandat impératif*, which mandate is to be changeable at the pleasure of the Hundreds and at any moment. Clearly, there would be a certain indecency in inviting members of Parliament to join in a measure for their own degradation. But there is more even than this. It cannot be supposed that the sort of man who would accept the

commands of this Committee is the sort of man who is fit to share its labours and govern England. He may be good to vote and to sit up when required, and to perform other menial offices; but he evidently is not of the stuff which makes a Committee-man of the Public Safety.

Indeed it would not be difficult to show that the association of members on equal terms with the Committee would, in view of the duties of the latter, lead to painful consequences. We are fortunately able to supply some omitted articles of the programme, which the Correspondent at the last moment seems to have thought almost too strong for the confiding editor of the *Pall Mall Gazette*. Article V. suggests that sub-committees shall be appointed for each constituency, to whom the members shall submit drafts of their speeches for final approval or correction. Article VI. proposes that when (in accordance with the suggestions of the *Pall Mall Gazette* itself) the constituencies have been duly manipulated, and all those which are likely to return Tories or plutocrats disfranchised, it shall be made compulsory for members to reside in a common lodging-house, under the supervision of the Committee. Article VII. provides that in the smoking-room of this abode there shall be a guillotine, at which any member disobeying the instructions of the sub-committee appointed to direct him shall be instantly "justified," to encourage the others. Article IX. defines a "rebellion against the national will," which is interpreted to mean the refusal at once to adopt any proposal endorsed by Mr. Bradlaugh, Mr. Chamberlain, or Mr. Peter Taylor. The means of providing against the immeasurable calamity, &c., alluded to in Article III. of the published programme are then entered into, and appear to be drawn from the practice of Chester and Birmingham. A strong protest is made in a rider to this Article against the impertinent and monstrous proceedings of the election judges, which in themselves amount to a rebellion against the national will. There is suggested as a matter for consideration the expediency of applying to such judges the guillotine treatment previously recommended for recalcitrant members. A similar rider puts the question whether Liverpool as an obstinately Tory town and one of great wealth ought not to undergo the treatment accorded to the *commune affranchie*—vulgarly called Lyons—in the sublime days of the French Revolution. The politician who makes this suggestion shrewdly points out that Lyons is a very sound community now, so that the best results may be expected from applying the same regimen to Liverpool. It is impossible to go through the whole of this very interesting appendix, which, as we have said, seems to have been withheld from publication by the Correspondent because he doubted the power of swallow of the *Pall Mall Gazette*, or perhaps because its contents, interesting as they are, are virtually included in the earlier and more general proposals. The public, therefore, but for the fortunate accident which enables us in a measure to supply the deficiency, would be left to its own ingenuity and knowledge of history to fill up the programme. Perhaps, however, the majority of educated persons would have no great difficulty in doing this. A copy of Mr. Carlyle's *French Revolution* would almost suffice to enable the dullest member of Parliament, who has voted for the Irish Compensation Bill and is going to vote for the Hares and Rabbits Bill, to do the filling.

We have treated this preposterous document as a hoax, and it requires something of an exertion to entertain the idea that it can be anything else. But it is at least worth pointing out that, like all good hoaxes of its kind, it contains nothing absolutely impossible. It is quite conceivable that the promoters of philo-Bulgarian and philo-Zulu and philo-Afghan and philo-everything-except-English meetings, should try once more the trick which has proved so often successful. The expression of opinion against hereditary peerages is taken almost verbatim from the *Secularist's Manual*, the book which used to be such a favourite study with Mr. Gladstone, and whose introducer now sits in Parliament by Mr. Gladstone's grace. The permanent Committee sitting against the possible immeasurable calamity of a Tory return to power is only an extension of the Hundreds, and expresses admirably the departure of those bodies from the old English system of fair party fighting. The nonsense about the organized destruction and the rebellion against the national will is only a repetition of nonsense that has been lately talked of at the meetings of a hundred Liberal associations, and which that lively young gentleman Mr. Herbert Gladstone was not ashamed to repeat the other day at Scarborough. Mr. Herbert Gladstone is dreadfully shocked at Sir H. D. Wolff and Lord Randolph Churchill; and he says, in a manner which we fear would have made Mr. Littimer smile, "We want to put a stop to this, and we mean to put a stop to it." So does the Correspondent's Committee want and mean to put a stop to all opposition to the crotchets which it pleases to entertain. The House of Lords and the House of Commons are alike to bow to its will. The former is to be abolished, and to be replaced by a pale copy of the latter, after which both original and copy are to be duly bullied into voting straight. There is nothing in all this which is in the least improbable as an expression of the views which it professes to express. The naïve crudity with which the plot is laid bare, and the bad English (for we think "possible immeasurable" would hardly find favour with most editors) in which it is couched, are certainly suspicious; but, after all, these are perhaps not reasons for absolute rejection. The theory that a Radical is of his nature rather a dull man may shock members of the party; but it has received some remarkable corroboration of late, and a complete want of sympathy with English political ideas and traditions is not intrinsically incompatible with an ignorance of the art of writing the English language. The *Pall Mall Gazette*, however, is to be sincerely thanked by all Englishmen, whether it has published these extraordinary proposals in a spirit of noble frankness or in a spirit of guileless credulity. The net is spread in the sight of the bird with the utmost openness, and it is the bird's own fault if he walks into it. American papers have since the advent of Mr. Gladstone's Ministry to power been taunting Englishmen with their clumsy and reckless adoption of revolutionary principles, and declaring—not without some truth—that the States are conservative and even reactionary in comparison with the English Radicals. Certainly it would not be easy to rebut this accusation if the Correspondent's ideas have any foundation except in his own ingenious brain. Nor, on the other hand, would it be easy to show the connexion which has always existed between extreme democratic opinions and acquiescence in a dictatorship better than by reference to this programme. For what seems to excite the Radical wrath is not so much the rejection of particular measures as the opposition offered to their temporary pet. That Mr. Gladstone should not have his way unchecked is what seems to them—or to some of them—so horrible. All this is, of course, invaluable to the defenders of the Constitution, because it strengthens their hands immensely, and must infallibly hasten the split among the opposite party which grows day by day more imminent. As long as the question appears to be one of allegiance on the old party lines to party leaders it is conceivable, though rather wonderful, that English gentlemen should allow themselves to be made instruments for the robbing of their Irish compeers, and even for the curtailment of their own customary and proprietary rights. But when a self-appointed permanent Committee issues orders to them how they shall vote, it is to be hoped that common sense and spirit will once more make themselves felt. The Liberal county members have proved remarkably docile to the Government Whips. But it may be hoped that they and their likes would think twice before accepting the dictation of an Executive communicated to them in documents signed Snooks or Shufflebottom. However this may be—and really the long suffering of Liberal members is so remarkable just now that there is no knowing what might happen—the common sense of the English people of that immense majority which is neither Radical nor Tory, but has a dim feeling of personal independence and of Parliamentary integrity, might be trusted to revolt against such a proceeding. This, no doubt, the wicked Correspondent saw, and the *Pall Mall* has amiably lent itself to his well-meant but immoral tactics.

COLOGNE CATHEDRAL.

It appears from a somewhat querulous article in the *Tablet* that a clause inserted by the Emperor's express desire in Prince Bismarck's recent Ecclesiastical Bill, enabling his Majesty to recall the exiled Bishops to their sees, has been thrown out in the Chambers, and that its rejection will have one effect which many besides those directly interested in the matter are likely to regret. The Cathedral of Cologne, which has now been six hundred years in course of erection, is said to be on the eve of completion, and a grand religious ceremony was to have been held this year in celebration of the event, at which the Emperor himself meant to be present, as his brother, the late King Frederick William IV. had been present in 1842 at the solemn dedication of the second foundation stone of the cathedral, to which he had been a munificent contributor. But in the enforced absence of the Archbishop no such ceremony could fitly take place, and it certainly is a pity that what may be fairly called an event of national and even European significance should have to be passed over in silence. The final completion of a church which has been so long in building, and the roof and towers of which exceed the height of any other building, secular or ecclesiastical, in the world cannot fail to be regarded with interest by many who are neither Germans nor Roman Catholics. And Cologne lies so directly on the high road for Continental travellers whether to Italy, Switzerland or elsewhere, that many of our readers will have had frequent opportunities during recent years of watching the progress of the work. But although its recommencement dates from 1842, six centuries have elapsed, as was just now intimated, since the first stone was laid. And it will not be unseasonable, now that the task is so nearly completed, to recall briefly the details of a story which stands alone in the annals of Christian architecture, if not of architecture altogether. It is curious in doing so to remember how an article on the subject published more than thirty years ago in the *Quarterly Review* opened with the "painful reflection that a great cathedral can never again be built in this country." And yet not many months have passed since the foundation stone of a cathedral, not indeed on the magnificent scale of Cologne but designed to reach no mean proportions, was laid by the Prince of Wales at Truro. The notion about cathedrals universally predominant among us till lately, and half sorrowfully acknowledged by the writer in the *Quarterly*, that the echoes of the glorious nave and aisles could only henceforth be awakened to the footsteps of a small congregation, passing as through a vestibule into the choir and the beautiful side chapels "used only, if used at all, as waste places for mouldering rubbish," has now been effectually dispelled, and the nave and aisles of

almost every English Cathedral have learnt once more to re-echo the preacher's voice and the chants of an assembled multitude.

The present *Dom-Kirche* of Cologne, though it was begun in 1248, when Frederick II. was Emperor of Germany and St. Louis King of France, is not the first but the third cathedral of that ancient city, founded by the mother of Nero as a Roman colony and converted to Christianity by the mother of Constantine. Of this it used to be said that "he who had not seen Cologne had not seen Germany," although Coleridge dismisses it so uncivilly in his familiar couplet. The original church, said to have been built by St. Maternus in the first century, has only a traditional reputation. The second was founded in 785 by Hildebold, 19th bishop and first archbishop of Cologne, but was not ready for consecration till 873, when eleven bishops met in provincial synod to attend the ceremony. It was, according to contemporary records, a stately Byzantine building with double choirs and crypts and three towers; it took fire in 1089, but was saved—by miraculous intervention, as was commonly reported—and in 1248 it was burnt to the ground. But there was another, and to the religious mind of that age still stronger, reason at that time for erecting a new and grander *Dom-Kirche* at Cologne. We cannot enter here at length on the popular legend of "the Three Kings"—better known to English readers as the Wise Men or the Magi—who have given their name in Germany to the Feast of the Epiphany. Suffice it to say that Caspar, Melchior, and Balthazar were respectively Kings of Tharsis, the land of myrrh, of Arabia, where the soil is ruddy with gold, and of Saba, where frankincense flows from the trees. After their return from Bethlehem they were visited in their old age by St. Thomas, when he came to preach the Gospel in India, and he baptized and ordained them. They died soon afterwards and were buried together, and many miracles were wrought at their tomb. Thither came the devout Empress Helena and found their bones, which she carried to Constantinople and laid in the church of St. Sophia, but in later days they were presented to Eustorgius, Bishop of Milan, and thence Barbarossa took them at the siege of Milan, and presented them to the city of Cologne, where they were housed for the time in the old cathedral of Hildebold. But it was felt always that this was no fitting shrine for such precious treasures, and in the time of Archbishop Engelbert, long before the fire, the design of building a new cathedral had been entertained. It was of course facilitated not only by the wealth of the city, but by the shrine of the Three Kings becoming a popular place of pilgrimage, and the brotherhood of St. Peter was formed under papal sanction for collecting contributions. In 1322, just 45 years after the consecration of the former cathedral, the choir of the new one, rising to a height of 208 feet, was consecrated with great solemnity and state, and began to be used for the services of the Church. There the Elector Palatine Rupert was crowned Emperor in 1400 on the feast of the *Drei Könige* (Epiphany), and there in 1402 his son, the Elector Louis, was married to Blanche, daughter of Henry IV. But the building advanced slowly, and it was not till 1437, nearly two centuries after the original foundation, that the southern tower was completed, and ready to receive the bells previously hung in a wooden belfry. Then followed a period of religious decline and artistic change, not favourable to church building or to Gothic architecture, and from 1509 the work seems to have come to a standstill altogether, the north aisles only being completed besides the choir; the walls of the south aisles and transepts were partly built, the nave was not even begun, the southern tower had reached the height of 170 feet, the northern tower scarcely showed as yet. During the sixteenth and seventeenth centuries nothing was done to the building, but in the eighteenth the Chapter exemplified the vile taste of the age in redecorating, and of course spoiling, the interior. But at the close of the century the Chapter itself, comprising forty-six members, of whom nearly all were Dukes, Princes, or Counts of the Holy Roman Empire, was dissolved and the last Prince Archbishop, Archduke Maximilian, had to retire from his diocese. Soldiers bivouacked in the Cathedral, and broke ornaments and windows, but seem to have done less mischief than Cromwell's soldiery did in our cathedrals. It was reduced to a parish church, in the French diocese of Aix-la-Chapelle, with three priests attached to it, and Bertholet, the new French bishop, unconsciously added insult to injury, when he gravely advised the people to plant poplar trees round their fine Gothic ruins to make the most of the effect. Napoleon refused even the scanty pittance asked by the citizens of Cologne to keep the fabric in repair, and it became more dilapidated every year.

At length in 1819, when Cologne had again been restored to Prussia, the old crane, which had for nearly four centuries been suspended from the southern tower, fell with a crash which startled not only the ears but the consciences of the citizens, and they actually showed their compunction by erecting a new crane in its place. But they did better than this. Something of the "inspiring heat" which prompted Wordsworth's noble sonnet kindled their zeal, and in 1824 the work of repair was begun in good earnest, and sixteen years later a *Dombau-Verein* for bringing the original design to completion was formed and placed under the patronage of the new King, Frederick William IV., who took the matter up very warmly, and promised an annual contribution of 50,000 thalers—about 8,000*l.*—towards carrying on the work. On September 4, 1842, nearly six hundred years after the first foundation-stone had been laid, the King himself laid the second, in the presence of a brilliant assemblage of civil and ecclesiastical potentates, and a vast concourse of spectators, amid all the grandest musical and ceremonial splendours of Roman Catholic worship. From that day forward the work proceeded steadily, and was taken up as a matter of national and indeed of European interest. The Queen of England was among the royal contributors, and herself assisted to place a bracket in the centre arch of the north front. The present Emperor has not, we believe, shown less zeal in the matter than his predecessor, and it is certainly unfortunate that the existing religious complications of Germany should prevent his taking as prominent a part in the consecration of the completed fabric, as the late King took in the laying of the new foundation stone some forty years ago. On the architectural and ornamental details of the building we have no space to enter here. To our own taste, we must confess, the immense height has always seemed to require a greater length for the due proportion and effect of a gothic church. Nor does it impress us, as a whole, with the same awful solemnity as some of the older cathedrals, both in the north and south of Europe. But it would be ungracious at this moment to indulge in criticism in recording the completion of what has been called "the most perfect example of the most perfect period of Christian architecture," and which is unique alike in its structure and in its history. According to a Protestant Prussian official, quoted by Dr. Döllinger in his *Lectures on the Reunion of the Churches*, it is destined to be no less unique in its prophetic import. "I am certain," he wrote, "that the time will come, before the newly inserted stones are mouldered, when a common *Te Deum* will be sung in the Cathedral of Cologne." Certainly there has been something remarkable, and almost unexampled, in the friendly co-operation during so many years of German Catholics and Protestants, headed by their Protestant Sovereign, in carrying this great national work to its completion. But there are no signs yet visible of the *Culturkampf* ending in a feast of reconciliation within the walls of the newly consecrated nave. Meanwhile Cologne, which has been called "the Rome of the north," may be congratulated on possessing a cathedral, differing widely indeed in style, as befits a northern clime, but not unworthy, for beauty of detail and magnificence of proportion, to take rank even with St. Peter's.

STEAM LAUNCHES.

THE lamentable accident (if accident it should be called) near Shepperton, just a week ago, has brought to a head the complaints which have for a considerable time been rife as to the inconvenience and danger caused by steam launches to every other kind of pleasure boat on the Thames. As concerning this particular disaster we are as yet not in complete possession of the evidence, and in any case it would be improper to express a positive opinion on a matter which, as we write, is the subject of an adjourned inquest. It is already manifest, unfortunately, that this case will not offer any exception to the general rule that collision cases are sure to produce an abundance of hopelessly conflicting testimony. According to the one side, the launch crossed the river and ran into the rowing boat, according to the other the launch was keeping a clear course at a speed of not more than four miles an hour, and the boat suddenly changed her course and ran across the launch's bows. On the one side nothing is heard before the shock is imminent, on the other it is sworn that the launch whistled loudly. The witnesses do not even agree as to the side of the river on which the collision happened. Pending the result of cross-examination and the verdict of the jury (as to which we sincerely hope the jurymen will remember that it ought to be free from even the suspicion of bias or passion, and that for a juryman to press a witness with pointed leading questions is not the way to insure this effect), we are confined to such reflections as are suggested by the most general aspects of the case. One statement of a general kind has been made in public, though not in court, which seems provisionally entitled to credit. A person well acquainted with the crew of the small boat which was run down has declared his conviction that the disaster cannot have been due to any incompetence on their part. If this may be believed, one consequence of general application at once follows. Whatever may be shown in excuse or explanation of the conduct of the steam launch will go to strengthen, not to weaken, our estimate of the intrinsic danger attending the navigation of the upper reaches of the Thames by vessels of this kind. Assume that no specific negligence in act or omission can be proved against the steam launch. Assume that she was competently manned and guided, which, considering that the owner, Mr. Desvignes, who steered himself, is a builder of launches and torpedo boats, and familiar with the river, is in itself more probable than the contrary; though, on the other hand, we have the fact, officially confirmed in the House of Commons on Thursday, that he has been twice fined and cautioned. Assume that no rule was broken as to carrying lights or otherwise, no practicable look-out wanting. The result, then, will be this; that, given a steam launch and a rowing boat within the distance involving risk of collision, in the far from absolute darkness of a summer night on the Thames, the rowing boat may, without gross negligence on either side, be cut in two and sunk, with loss of life. The less personal fault can be brought home to any one the greater is the risk of the conditions under which such things can happen. It needs no particular experience to know that a steam launch carelessly handled must be an extremely dangerous thing on a river frequented by smaller craft. But there is a suspicion, or more

than suspicion, that the truth goes beyond this; and that no skill or care such as persons of ordinary competence can use, or at all events are in practice likely to use, will avail to make steam launches otherwise than dangerous on such a river as the Thames. It is by no means necessary to suppose that owners of steam launches are by nature more reckless or indifferent to the safety of their fellow-citizens than other men. But it does seem established beyond fair question that when a man finds himself master of a steam launch he is apt to find recklessness very tempting, or prudence very difficult. The luxury of high speed is apparently an enticing one even in places where one cannot conceive that any man with eyes in his head should desire to hurry. And high speed on a long vessel in a stream abounding in sharp curves (of which there is one at Shepperton, probably not unconnected with this particular calamity) means unhandiness and great difficulty, if not impossibility, of changing the course on an emergency to avoid a collision. A steam launch does not look so very long on the water, but that the length is in some cases at least excessive as compared with the width of the navigable channel was clearly shown by one of the letters recently published. The writer described the violent manœuvres of a launch to effect a turning, during which it was made impossible for the rowing boat from which he witnessed them to do anything but keep out of harm's way under the bank.

The rule is as express and binding on the Thames as on any other waters that it is the duty of a steam vessel to keep out of the way of other vessels. If it were diligently observed there would be nothing to complain of but a certain loss of amenity, which of itself would hardly afford a just ground for restrictive action. But in practice it appears that this is reversed by the steam launches, and other boats have to keep clear at their peril—a state of things which for some years has been notorious, but is not therefore to be accepted as desirable or inevitable. Various remedies have been proposed; at present the launches are timed at the locks, and their mean speed may thus be checked; but this is little or no security against a dangerous speed at particular points. One engineer has proposed a limitation on the engine-power and dimensions of the screw, so as to make excessive speed physically impossible. But this would involve a system of inspection difficult to carry out; and we confess that, the nuisance being proven, we see no reason why the abatement should not be more complete. If steam launches cannot keep reasonably and safely clear of rowing boats in the parts of the Thames where the exercise of rowing is most used and valued, the most effectual way would be to clear those parts of them altogether, or at least to confine their activity within much narrower bounds by establishing close hours or other restrictions. One simple measure which would give some security, together with the least possible ground of complaint, would be to forbid any movement of steam launches after dark. But it is really not a case for being timid in repression. There is no question of disturbing vested rights or fettering lawful industry. It is only a balance of pleasure we have to adjust (though we do not know why people should be ashamed of taking some thought for the innocent pleasures of life); and it is evident that the mere luxury of the few should not outweigh the recreation of the many. The question is whether a small minority of the people who go to take their pleasure on the Thames are to be allowed to take it in a manner which interferes with the pleasure of the vast majority to the extent, not merely of annoyance, but of danger. Is it worth while for the community to buy one kind of pleasure for one small class of persons at that price? Thus we may put the case if we only regard quantity of pleasure; but, if there is any case in which the consideration of quality may be allowed some weight, surely it is where the matter at stake is the enjoyment of one of the most excellent and healthful pastimes known, and of some of the most beautiful river scenery in the world. And, if quality be taken into account, it is yet more manifest that the steam launch ought not to be suffered to hamper genuine boating. The sight of an able-bodied man lounging in a steam launch is at best nothing for civilization to be proud of, and for those who love the river of old there is a kind of profanation in it. We are not for returning to the policy of attempting to regulate the sports of the people of England by a paternal system of compulsion and penalties; but when a particular form of amusement appears to create a nuisance to those who are pursuing other lawful amusements, we may fairly consider the merits of the amusements themselves in determining which ought to give way. If the owners of steam launches did not interfere with the other uses of the river, nobody would want to criticize their taste. As it is, we are free to say that their pastime is an ignoble one, and the world would lose nothing by its disappearance. But if, from their point of view, the worst came to the worst, the river below the locks would always remain open to them.

So far we have assumed in favour of the steam launches, or rather of their owners, that they are not commonly navigated with any wanton or wilful disregard of the safety of rowing boats. But, if half the published complaints may be believed, this is a large assumption. The persons in charge of a steam launch can generally despise the rules of the river and the courtesies and humanities of life with practical impunity; and the possession of such a power is but too likely to lead to frequent abuse of it. Again, it is possible enough that the engineer and steersman of a steam launch may know very little of the rules of navigation and nothing of boating, and may be incapable of understanding the risk and trouble they impose on others. Right or wrong, they enjoy the security of the brazen pot in collision with the earthen one, and the nature of things fails to provide a self-acting penalty for ignorance. In such a case, however, ignorance is hardly less culpable than wilful misconduct. We have said nothing of the damage to the banks, which is believed to be a serious matter, nor yet of the claim of the public, apart from the enjoyment of rowing, to have the upper Thames kept reasonably free from the noise and disfigurement of steam vessels. These are minor points, but they all tell the same way. As for legislation, our impression is that the Conservators have sufficient powers already, so far as making regulations is concerned; but the power of enforcing them has been admitted by Mr. Chamberlain to be "altogether inadequate to prevent mischief." At present the maximum penalty is 5*l.*, and that is seldom inflicted. If the Board of Trade chose to take up the matter strongly, a short Bill extending the powers of the Conservators in this respect might possibly be got through before the rising of Parliament; but in the conditions of the present Session, and in the face of the many perplexed matters to be dealt with at home and abroad, this is hardly to be looked for. One thing we have lately observed which seems in the meantime a fair subject of administrative action. Divers hoardings and blank walls in London are adorned with the bills of a Company who "threaten and intend," as the old Chancery pleadings used to say, to put on the river between Kingston and Oxford a large passenger steamer carrying something near two hundred persons. Pledges of competence and care may doubtless be more easily exacted from the managers of such a concern than from the owners of private launches; but it is impossible that it should be conducted without the gravest inconvenience to other craft. Is it too much to ask that, until order be taken in the matter by some more general provision, at least this new monster may be restrained from adding to the perils of the Thames?

JESUIT THEORIES OF TOLERATION.

A CORRESPONDENCE which has lately appeared in the *Times* on the "Expulsion of the Jesuits" has an interest beyond that of the particular question which prompted it—the attitude of the French Jesuits and clergy generally towards the Republic. The larger question however arises so directly out of the lesser one that we shall best indicate its bearings by briefly retracing the line of argument followed by "L. M. H." who opens the correspondence and the Abbé Martin, "Professor [of what is not explained] at the Catholic University of Paris," who replies to him. "L. M. H.," who writes in a courteous and temperate manner, and does not appear to be influenced by any spirit of Protestant narrowness or bigotry, professes to give the result of recent conversations held with a number of ecclesiastics, regular and secular, in various parts of France in reference to the present "persecution." All were agreed—as was natural—in denouncing the action of the Government, but they were also, it seems, agreed in admitting that the Government was acting, from its own point of view, in self-defence, though they denied its right to do so. Between the present "Atheistical" Republic and all friends of the Jesuits, which is afterwards explained to include all friends of the Church, there can only be war to the knife. This would, it was freely allowed, be the temper fostered in the *alumni* trained in Jesuit colleges, and it found expression the other day in the enthusiastic chants of a number of Jesuit pupils from the province of Toulouse who went on a pilgrimage to Lourdes. But more than this is allowed in the following significant passage:—

> "We freely admit," they added, "that if the Roman Church could dominate, its principles must lead it to treat its politico-religious opponents in the like way. But we claim freedom for ourselves in every country which professes to base its government and institutions upon political and religious freedom, while our own principles forbid us to allow such freedom to others, wherever we have power to carry our principles into practice."

Nobody of course can fairly be surprised that not only the Jesuits but the whole body of French Roman Catholics should be irritated by the present ecclesiastical policy of the Government, the wisdom and justice of which has been very generally disputed by its English critics of every school of political thought. We can hardly even wonder that they should see in it "a war, a persecution against religion itself," the real aim of which is "to uproot the Christian religion in France." In further proof of this they point to the cutting down of episcopal salaries, the secularization of municipal schools and of charitable administration, and other details of recent policy. This dread unites in a common antagonism to the Republic those who have not usually many common sympathies. The parish *curés* freely admit that the work of religious orders often clashes with their own and that they would be glad to see their number curtailed and their action modified, but in the present conflict they hold the cause of the Jesuits and the other Orders assailed to be identified with their own. And hence must be explained the transference, if correctly reported, of the Jesuit colleges to members of the secular clergy, in order to escape suppression.

There remains however the grave question, touched on in our previous extract, to which "L. M. H." returns at the conclusion of his letter. Are those who protest against "persecution" raising a one-sided cry, or are they prepared honestly to abide by the principle which they invoke in their own defence and to do to others as they would be done by in the matter of liberty of conscience, teaching, and worship?

Not many years ago there were Roman Catholics of name and position both in France and England, and perhaps elsewhere also, who would frankly have answered in the affirmative, and would have meant what they said. Lacordaire and Montalembert are referred to as typical examples. But the writer complains that he can get no such answer now, and he cites two recent cases in evidence of the authoritative sanction of a very different spirit. During the last few years liberty of worship and teaching has been constantly asked for by the few hundred German Protestants in the little principality of Monaco, and it has always been refused, though a word from the Roman Catholic hierarchy or laity of France would have gained it for them. Then again the Cardinal Secretary of State vehemently protested only the other day against the sale of a site for an Anglican church within the walls of Rome. To the latter point it might be plausibly replied that the official protest was probably little more than a formal carrying out of the traditions of the Curia, while even under the rule of Pius IX. the English were allowed to have a church of their own without the walls, the distinction apparently being one without any very intelligible difference. But even so the traditions of the Curia must be held to bear witness to an assumed principle, and it is the more noteworthy that it should have been thought necessary publicly to reaffirm it, even if only as a formality, in the name of a pontiff who is known to be personally a man of statesmanlike temper and liberal views. But "L. M. H." does not confine himself to inferences from public acts. He appeals also to the direct testimony of his French interlocutors:—

> My priest friends, I am sorry to say, only smile at this view, and frankly avow their Church cannot stand it. They say the school of Montalembert and Lacordaire is a thing of the past; that they are now counted not good Catholics; that Rome, by the Syllabus, has put down such notions; that if among their present ecclesiastical leaders there be any who share such ideas, they dare not utter them, knowing the prompt condemnation they would incur. Hence, they only repeat what I said above, "We must claim freedom for ourselves in free countries, but we must avow that our own principles forbid us to grant it to others, if we can avoid so doing." This gives a sad, hopeless outlook to the present conflict in France.

We cannot of course tell exactly how far these "priest friends" are qualified to speak for their brethren generally, but it does indeed "give a sad, hopeless outlook to the present conflict in France," if religious intolerance on the one hand is to be pitted against irreligious intolerance on the other, and there is an equal indisposition on both sides to "harmonize faith and freedom, religion and country." Nor can it be denied that the Syllabus, whatever its precise authority—and the whole Ultramontane school regard it as an infallible pronouncement—does emphatically condemn the views of Lacordaire and Montalembert, and that the latter especially was denounced after his death in no measured terms by the late Pope, and even refused the customary observance, to which he had an official claim, of a solemn Requiem at Rome. That the Jesuits have from the first consistently maintained the principle of persecution is well known; but it is fair to remember, on the one hand, that the Order came into existence in the very crisis of the Reformation struggle, and for the express purpose of combating the enemies of the Papacy, and on the other hand, that all the leading Reformers, without a single exception, maintained as strenuously the theory of persecution, and carried it out in practice, so far as they had the opportunity. The misfortune is that the Jesuits, as was abundantly shown in *Janus*, still uphold in all its fulness the persecuting doctrine they started with, and that the growing tendency of the last thirty years has been to convert Jesuit doctrine into the accredited teaching of the Roman Catholic Church. Leo XIII. is known to be no admirer of the Order, as neither is he an admirer of the fatal policy of his predecessor, but it does not follow that he will be able materially to remould the *damnosa hæreditas* that has been bequeathed to him.

On the day after the appearance of "L. M. H.'s" long letter in the *Times*, it was answered at almost equal length by the Abbé Martin, who claims to speak the mind of the French clergy, both secular and regular. And we turned to his letter with some curiosity to see how he would deal with this aspect of the question. His method of treating it disappointed but did not surprise us. As to mere abstract political opinions he is very explicit, and we have no doubt speaks from knowledge. He declares for himself and for "the immense majority of the clergy in France"—as he had already asserted in an article in the *Nineteenth Century*—that they are "neither Legitimist, nor Orleanist, nor Imperialist, nor Republican," but are equally ready to acquiesce in any form of Government that will guarantee them "order and peace." In this he does but represent what has been for nearly a century past the normal attitude of his Church, which cares little for rival forms of Government, as such, so long as its own interests are secured. And it is true also, as he argues, that a priesthood, like the French, mainly recruited from the lowest ranks of society, is not likely to be particularly addicted to aristocratic sentiments or leanings. But if the Abbé pointedly disclaims any abstract political preferences, he is no less explicit in denouncing in the concrete "such a Republic as is at this moment disgracing France," and he goes on to intimate in pretty strong terms that its misdeeds cannot but prejudice the cause of Republicanism itself:—

> And will any one say that the Republic itself, considered as a form of government, is not damaged by passing events? One must be very simple not to see it. Here is a form of government which appears in France now for the third time. Twice already it has plunged the country in shame and desolation, has deluged it with blood and covered it with ruins; and people wonder that there are those who feel alarmed when they see it for the third time falling into the same errors. They wonder that the clergy of France has not forgotten the massacres of the Carmes or of the Abbey, the *Noyades* of Nantes, the dungeons and the guillotine! They wonder that in the presence of men who swear by Carnot, by Carrier, by Danton, and by Robespierre the clergy exhibit uneasiness; first on account of the Republicans, and secondly on account of the Republic. What *naïveté!*

On these points the Abbé Martin speaks plainly enough, and his remarks offer no special ground for criticism. He next proceeds to deal with "L. M. H.'s" estimate of the views of the French clergy on liberty of conscience and persecution, against which he records a "solemn and categorical protest," as an entire misrepresentation of what they really think. He adds that "they do in fact ask for liberty on behalf of all opinions which are not directly at variance with reason and the natural conscience," and are ready to grant to others the liberty they claim for themselves. The exact force of his limiting clause about reason and conscience, which is several times repeated and emphasized, is not very clear, for we are told soon afterwards that, while in the English Parliament there is only one Bradlaugh, the French "House of Deputies and Senate are filled with Bradlaughs," and nobody desires to turn them out, though the clergy do not vote for them. Yet we had been assured before that the clergy hate the existing Republic, not *quâ* Republic but because they hate "the Republicans who crowd the Parliament." Does not the Abbé mean that they acquiesce in a "Parliament full of Bradlaughs," just as they acquiesce in the principle of religious liberty for all opinions, simply because it would be useless under present circumstances to contend against either? If he means that they accept the principle itself, as Lacordaire and Montalembert accepted it, he has entirely failed to meet the startling testimonies to the contrary adduced by the writer he had set himself to refute. To say that there is a persecuting tendency among French Liberals who just now are in the ascendent, may be quite true, and is freely admitted by "L. M. H." The question is whether their present victims, if their relative positions were reversed, would not deal to others the measure they so bitterly resent having dealt to themselves. And on this point the Abbé throws little fresh light. His opponent's argument from Monaco is met, or rather evaded, in a rambling paragraph about "the famous Mr. Bradlaugh," so absurdly irrelevant that it reads like a longwinded and clumsy attempt at jocosity. The Cardinal Secretary's protest against the new Anglican Church in Rome is passed over in silence. In short, when he is concerned with the political sentiments of the French clergy, and their grounds for disliking the present *régime*, the Abbé Martin speaks freely and intelligibly, and with every appearance of being well informed; in dealing with the graver question of their true estimate of the principle of liberty of conscience he seems to write under constraint—as having the fear of the Syllabus, or of its popular exponents before his eyes; and it is not easy to arrive at a clear appreciation of his meaning. Most likely he has never cared to analyse it too closely in his own mind. But the French Catholics may rest assured that the sympathy felt in many quarters with their protests against the "persecution" to which they are subjected is seriously prejudiced by this hesitation, or worse than hesitation, on their part—and not on their part only—to accept frankly and unreservedly in their dealings with others the principle to which they so eagerly appeal in their own defence. We do not say that this excuses the policy of their adversaries; that is no true toleration which has not learnt to tolerate the intolerant. But it explains what it does not excuse. If the eloquent protests of Montalembert against the Inquisition and the dragonnades are condemned as heterodox, and he himself is thrust aside as "not a good Catholic," we can hardly wonder, though we may deplore it, if those now in power in France take their orthodox countrymen at their word, and seek forcibly to suppress while they have the opportunity those whose avowed principles, if the tables were turned, would prove fatal to themselves.

IMPOVERISHED LANDLORDS.

MANY ladies, on taking their first drive after arriving in London for the present season, found the houses of a number of their friends shut up, with "To be let furnished" printed on notices affixed to the windows; and on looking in their Red Books for the addresses of such of their acquaintances as usually take houses for the season, there were none to be found. "Where are the So-and-sos?" was a question constantly heard, with the usual answer that they were not coming up to town this season, or that they were going to hotels or lodgings. Instead of the fashionable papers being filled with descriptions of the balls and banquets given by great people, it is far more common to find notices that "the Earl and Countess of Rabbitborough have left Boodle's Hotel, Albemarle Street, for Shortrent Castle, Poorshire," or that "Lord and Lady Narrowphile have left England for a lengthened tour on the Continent." There are comparatively few balls, horses are not selling well at Tattersall's, there are fewer smart carriages than usual in the Park, and tradespeople are complaining bitterly of the flatness of the season. Heartrending stories are circulated about reduced rents, and many hapless Irishmen say that they are receiving no rents at all. Altogether, good society declares itself to be in a very bad way. It would seem that Rotten Row is filled with beggars, that the Clubs are little better than casual wards, and that the hospitable have to feed the hungry, without expecting to receive from them again. We have

been much preached at for some years about pauperization; and it now appears that one of the most pauperizing of influences is the possession of a large landed estate.

We always entertain a respectful sympathy for the poor and needy, and we are painfully alive to the fact that very many landlords are suffering serious and most trying losses through non-payment or reduction of rents, the bankruptcy of tenants, and unlet farms. Most manfully too, in many cases, are the landowners facing their losses, and putting themselves to great personal inconveniences in order to help their hard-striving tenants. Large houses are shut up, summer trips are relinquished, and backs are turned on tempting purchases. Hard-hit British landlords have faced their difficulties with the pluck for which their race has always been distinguished, and an amount of good feeling has been shown which goes far to prove that there is still some sort of feudal attachment existing between landlords and tenants. All such distressed landowners as these fairly come under the category of deserving poor. Unfortunately, however, among impoverished landlords, as among other descriptions of poor people, there is a great deal of imposition; and there are not a few cases which are worthy of the notice of the Mendicity Society. Much as we sympathize with landowners who are hardly pressed and inconvenienced through the loss of their rents, we feel little pity for those who are taking advantage of trifling losses to pose as martyrs. To follow the fashion is the vital principle of good society; but fashions are sometimes inconvenient. To obtain the services of Mlle. Sarah Bernhardt for the amusement of one's friends at an evening party, to collect pictures, china, and old armour, to drive perfectly matched teams, to belong to White's or Arthur's, are all fashions which for various reasons it is not always easy to follow. Just at present, on the other hand, there happens to be a fashion which is far more easily complied with. It is the correct thing now to be poor, and most people will find little difficulty in accommodating themselves to this fashion. Not unfrequently the profession of shortness of funds is honest and genuine enough; but then this sudden ostentation of poverty implies previous wealth, which is sometimes purely imaginary. The public again are left to infer that the man who is at present suffering from a temporary reduction of rents will be a rich man when his farms are re-let and his tenants are able to pay their usual rents. Surely if a landlord, who apparently enjoys plenty of the good things of this life, complains bitterly of temporary destitution, his acquaintance must be worth cultivating, as he is evidently a perfect Crœsus in ordinary times. It would be natural to argue in this way, but experience has proved the futility of such reasoning. The truth is that comparatively few of the people who take houses for the season in London depend for the most part on incomes derived from land. The owners of estates, if they have no other property, find their incomes so frequently diminished through farm buildings, cottages, and other estate improvements, that even if they have tolerable rent-rolls, they seldom find any available cash for London dissipation. The owners, too, of moderate estates are so often burdened with large country houses and heavy local expenses and responsibilities, that their large expenditure at home leaves too narrow a margin to allow of the cost of a London season on a scale at all commensurate with their social position. Setting aside, therefore, very well-acred proprietors, the country gentlemen who annually take London houses during May, June, and July are generally men who have small estates and comfortable incomes from other sources. Accordingly, when a man who receives several thousands a year from personal property, and but a few hundreds from land, professes himself terribly impoverished because he has been obliged to allow his tenants a reduction of ten per cent. in their rents, we venture to think him rather a humbug. We allow that it must be very unpleasant to a man who has five thousand a year to have his income reduced by fifty pounds; but we do not think that he deserves on that account to be classed among the suffering poor. We feel even less sympathy for such a person when he makes his comparatively trifling loss an excuse for spending the season in an hotel instead of taking a house, and expecting his friends to entertain him, while he saves himself the trouble and expense of hospitality on the plea of temporary poverty; nor can we justify him for refusing to contribute to charities or beneficial undertakings on the same grounds. Some clever people of this sort manage to obtain as much commiseration as others who have lost a tenth of their entire income. There are some, too, who are not above stinting their children, or even facing their wives' anger or sorrow, on the strength of their diminutive agricultural losses. That people in general had a few years ago acquired a habit of living up to, if not beyond, their incomes, is true enough; but that fact does not justify parsimony or false pretences. We honour men who wish to reduce their expenditure within moderate limits, or to save, if need be, for those who are to follow them; but it is quite another matter to affect losses which are purely imaginary. Those who have a few hundred acres of land too commonly labour under the impression that their little estates give them great dignity in their own counties and an important social position in the metropolis. Of these dignities and positions they are both proud and jealous, and they would be much annoyed if they knew that any of their acquaintances were unaware of them. Not to have lost money during the last few months practically means to have no landed property; so it is essential for the English gentleman, real or pinchbeck, to be suffering from a reduction in his income. To have lost money through lowered rents and unlet farms means to have much landed property; and consequently there are many who are ready to act the part of heavily-mulcted landlords.

Seriously as landlords have suffered through the agricultural depression, at the late general election there was no lack of them as candidates for Parliament; and, in spite of their alleged impecuniosity, more money than usual is believed to have been spent in persuading electors. If there is a scarcity of money at present, people seem thoroughly to understand the art of making a selfish use of what little is left. Indeed it is a remarkable fact that a large number of landowners who are at present bemoaning their poverty generally manage to get a thing if they particularly want it. With those who have really lost money, something of course has to be sacrificed, but it is seldom anything that they very particularly care about. It is in the item of charities perhaps that the greatest economy is practised, for in this matter a ready and simple means of retrenchment is afforded, and those who do not let their right hand know what their left hand doeth may make up small deficiencies in income by abstaining from any natural inclinations towards liberality. Many large landowners who have been obliged to make returns on their rents are not really much poorer than usual, because, when they were receiving full rents, they expended large sums on expensive and unnecessary adornments to farms, enclosures, and plantations, whereas now they only lay out such money on their estates as may be absolutely needful. It is natural that owners of landed property should consider their own losses in a more serious light than those of proprietors of stocks and bonds; but they certainly receive more sympathy in their distress, and somehow or other their complaints are more tolerated than those of the owners of depreciated personal property. He who goes about deploring that he has farms on his hands, and that he is not receiving full rents, is not thought a bore, but is treated with respectful sympathy; but if a man tells everybody he meets that he has lost four or five thousand pounds in a Gas Company or in Bolivian bonds, people have an idea that it serves him right, and so feel little pity for him. We fail to see why there should be any disgrace in loss of money in personal securities, if it is rather honourable than otherwise to suffer loss as a landowner; but it is not the less true that such is the conventional sentiment, although few people would care to own it in so many words.

There are landlords who live so closely up to their incomes in times of prosperity that even a slight reduction in their rents hampers them seriously, while others who have suffered far greater losses are not affected at all as regards their personal expenditure, because the wide margin which they always leave between income and outlay is not half obliterated. It is therefore far from being the case that those landowners who are most embarrassed have suffered the largest proportional losses of income, although they usually meet with the largest amount of sympathy. It is accordingly very difficult to know who do and who do not deserve pity among the many owners of the soil who are bemoaning their impoverishment. As a rule, in this as in most other cases, it is not to be taken for granted that those who cry the loudest are the most hurt. At any rate, if they are the most hurt, it is not because they have suffered the largest proportional reduction in their rents. Few fashions are of long duration, and we have little doubt that the fashion of poverty will soon pass away, like others, and then it will again become the fashion to affect wealth. In the meantime, landowners who are complaining or sulking may profitably meditate upon the losses and the ruin of many of their tenants. Where the landlord has to deny himself a few extra luxuries, the poor farmer has often to give up comforts which are very little short of necessaries. We heartily sympathize with the genuine sufferings of impoverished landowners, but we recommend them to take consolation from comparing their sorrows with those of their tenants.

CRICKET.

THE Rugby and Marlborough match is almost the last event of the season at Lord's which has any public interest. We may therefore use it as an occasion for some more or less desultory reminiscences and criticisms of the play since the University match. The Rugby and Marlborough contest is not a fashionable affair; but, not the less, or rather all the more, it is a very pleasant spectacle. The lookers-on look on in real earnest, and devote very little time to lunching; none at all to the criticism of costumes. The cries with which old boys express their interest, their delight, or their dismay, are almost as loud as anything one hears from the vast throng that circles the ground when Eton meets Harrow. The cricket displayed this year, though the match proved to be one-sided, was more free and brilliant than that shown by the more famous schools. The batting of Eton this year was exceedingly "pokey," the boys' elbows seemed to be fastened to their sides. No doubt two very damp seasons of untrustworthy wickets explain the lack of dash, and the caution which occasionally degenerated into timidity. There was no such coy reluctance to hit in the Rugby Eleven. Most of the boys had played at Lord's before; their captain, Mr. Leslie, had played three or four times; and almost all were really young men rather than boys. The Marlborough Eleven, on the other hand, seemed little more than children beside their big opponents. Mr. E. E. Steel,

a most artful little bowler, who may some day rival his brother, is one of the youngest players we have ever seen at Lord's. In a match where weight and experience and the confidence given by a nearly unbroken series of victories were all on one side, it was natural to sympathize with the forlorn pluck of the Marlborough boys. The enemy was far too strong for them. Mr. Leslie got ninety-one runs, and Mr. Cave also hit very freely for his thirty-three. Too many catches were missed; and, if ever the Rugby boys play for either University, they will find that it is not safe to hit up to leg. They did so with impunity against Marlborough; but it is another thing when men like Game, or Pulman, or Webbe, or Hirst are fielding near the ropes. The Marlborough point stopped some extremely hard hits, and was often applauded. The fielding of Mr. Tatham was also admirable. We have already praised Mr. Steel's bowling; after puzzling Mr. Leslie with three balls in an over, he bowled him with the fourth, and just prevented him from making his hundred. But it was Mr. Leaf, we think, who performed the neatest trick. He gave the batsman three balls a little wide of the off-stump, and all twisting from leg. To avoid the chance of sending a catch, the batsman prudently left those alone, a plan learned from experience of Mr. D. Buchanan's bowling. The next ball pitched on the same spot, but with the opposite break on it, so that when the batter once more tried masterly inaction, his off-bail was neatly removed. This was really artistic, and reminded the pleased spectators of a similar *ruse* by which Mr. Fenton Miles once overcame the defence of Jupp. The batting of Mr. Bowden Smith and Mr. Walrond was very good and steady, and it was pleasant to see those old Rugby names so well represented. The two innings in which Marlborough only obtained ninety-nine runs do not call for much remark. Mr. Leaf played well in a somewhat peculiar style for his twenty-one, and Mr. Hill's free and graceful manner seems full of promise. Mr. Steel had been unfortunately hurt in the Rugby innings, when three fielders ran to the same catch and fell in a heap on the ground. The bowling of Mr. Arnold (left hand) and Mr. Hirst was very straight, and the Marlborough batting was not calculated to alarm or demoralize the bowlers. The fielding of Rugby, and the wicket-keeping of Mr. Cobb, recalled the excellent performance of Harrow and of Mr. M. Kemp. Marlborough must not be discouraged by the success of such powerful opponents. Rugby is probably good enough to play any school this year. Charterhouse is apparently very strong in batting, as the boys scored over two hundred and fifty against Midwinter, Rylott, and Flowers. Midwinter is bowling with great success this season, and Rylott is, or used to be, very dangerous to Elevens unaccustomed to the best professional bowling. For some years Rugby has scarcely contributed her due proportion to the University Elevens, but we may expect to see Mr. Leslie arrayed against the ranks of the light blue next year; and the Rugby bowlers are also likely to find an extended sphere of usefulness.

To turn from the works of boys to those of men, it must be said that Dr. W. G. Grace's cunning has by no means deserted him. His batting in Gentlemen *v.* Players at Lord's was quite faultless, for the bowling of Shaw and Morley was extremely difficult, and the wicket was exactly suited to both of them. When we remember that Morley, on a favourable wicket, dismissed the Surrey Eleven for sixteen this week, the merit of Dr. Grace's performance may be easily estimated. Fifty runs got against the great masters of the bowling art, when both are on their day, and both are suited with a rapidly drying wicket, are worth more than two hundred runs hit off inferior bowling, on a ground like a billiard-table. The list of amateur bowlers has received an addition this year in Mr. Rotherham, who greatly puzzled the Players. He bowls very fast, but his delivery seems to us more doubtfully fair than that of Mr. Evans, about which many hard things have been said. Mr. Rotherham has scarcely acquired the art of bowling many good length balls, but if he adds this accomplishment to his pace he will prove very formidable. The Gentlemen nearly threw away the match against the Players by carelessness in the second innings of the professionals. Mr. Steel was lame, and his balls, lacking their normal vivacity, "came off the ground like baked potatoes." The captain seemed reluctant to resort to strong measures and entrust Mr. Evans with the bowling. When he did bowl, he was exceedingly dangerous to life and limb, and one of his balls, being tipped by the batsman, struck Mr. Alfred Lyttleton on the head, and was caught by longstop. The match between veterans over thirty and the younger Players and amateurs at first seemed uninteresting, as many of the best gentlemen had left town. The new combination gave us Shaw and Morley on opposite sides, and the match ended in as close an affair as the Berwick election, the younger men winning by two runs. Mr. Royle, who is now so seldom seen at Lord's, saved the match by one of those marvellous pieces of fielding at cover-point which Oxford remembers and Lancashire appreciates so well. Dr. Grace again played in his best manner, and Mr. Vernon sustained his reputation for safe and brilliant hitting.

A curious, melancholy, and instructive affair was the match between Gentlemen of Scotland and Gentlemen of the M.C.C. This match had been announced as Gentlemen of Scotland *v.* Gentlemen of England, but the Northern Eleven found only a somewhat "scratch" team of amateurs prepared to meet them. Mr. J. E. K. Studd, Mr. Ford of the Cambridge Eleven, Colonel Kenyon Slaney, who had just scored over a hundred in a good match, and Mr. C. J. Thornton, were the most famous of the English side. The Scotch were inclined to lament the want of more worthy foemen, but they received a crushing defeat. Bowling seems to be a lost or at least a neglected art north of the Tweed. Cricket is now a very popular game in Scotland. There are five or six schools which yearly contend for the championship. The Border towns renew the rivalries of the Border clans. Wickets are pitched in every green field from New Galloway to Golspie, and yet there seem to be few bowlers in bonny Scotland. Mr. M'Lachlan, of the Oxford Eleven, did not play. Mr. Robertson, the Middlesex fast bowler, was sadly to seek; Mr. Lang, who bowled for Oxford in "Ridley's year," was able to bowl Mr. Thornton with his usual punctuality and despatch, but was clearly out of practice. The other bowlers were possessed of an intermittent delusion that half volleys to leg ought to be judiciously alternated with long hops to the off. Though Mr. Craig got seven wickets, he owed his success mainly to the excellent wicket-keeping of Mr. Leslie Balfour, the distinguished golf player. The English side scored over two hundred, and Mr. Thornton hit a ball over the wall beyond the tavern. Though Mr. Ford was the only recognized bowler on the English side, the Scotch gentlemen scored most feebly. Mr. Lang made thirty-six, and defied all efforts to remove him; but Mr. Cotterill, a really fine bat, and one of the hardest of hitters, Mr. Balfour, and Mr. Russel, failed to serve their native or adopted country. After following on, Scotland did better, though Mr. Balfour's innings was not, as usual, *sans reproche*. The English Eleven got the necessary 93 with the loss of only one wicket, and Mr. Studd "took coffee," as the Zulus say, with all the Caledonian bowlers. "There was mair tint at Flodden," as the proverb goes; but, as at Flodden, it was the Scotch deficiency in artillery that told. Their fielding, too, was anything but exemplary, and, as their batsmen were not fortunate, they seemed all too rashly daring in their attempt to gather laurels at Lord's. The Northern schools and clubs must take this defeat to heart, and aim rather at producing good bowlers than at making huge scores of over six hundred runs against stuff worse than a college second Eleven could supply.

The chief event of the future is probably the match between the Australians and Gloucestershire, at Clifton. The colonists have not lost a single match, and the affairs which have been drawn were generally drawn in their favour. It is true that they have usually played local Eighteens, and their opponents have been men of straw, only too pleased to receive one over from Spofforth. Mr. Marshall, however, showed a stern defence at Newcastle, which makes it the more strange that he was omitted from the Scotch team that played at Lord's. The Yorkshire Eleven which seemed so certain to be beaten by the colonists was not, properly speaking, a county Eleven at all. In a match this week, which had to be drawn, Gloucestershire more than doubled the first innings' score of Yorkshire, and thus it is possible that the southern county may make a good stand against the Australians. But the latter have not played this year against Morley and Shaw, against Mr. Morton and Mr. Steel, nor do we think it very probable that a satisfactory match will be arranged. As things have gone so far, it seems scarcely wise to try to patch up differences, and to make a match at the very end of the season, when every one is out of town. The disputes between the Australians and the leading clubs are not quite intelligible, but they exist, and make the prospect of a friendly match seem most uncertain. No one wants a repetition of the scenes which were witnessed when the Australians were in America.

DRAWINGS IN BLACK AND WHITE.

THE simultaneous opening of all the summer exhibitions of art in London is a matter of much reflection to the indolent satirist, but he is apt to overlook the still more startling way in which all these fountains of æsthetic culture are simultaneously closed. The country visitor who has been obliged to put off until now his projected trip to London will call on Monday at New Bond Street only to learn that the Grosvenor Gallery shuts to-day. The same answer will meet him at the doors of the Society and of the Institute of Water Colours. He will be denied, in the same provoking terms, a sight of Beauty at the Graphic Gallery, and of M. De Neuville's "Rorke's Drift" in Bond Street. While fretting under these rebuffs, he will determine to spend his Monday morning at the Royal Academy, but the crowd of holiday-makers will daunt him, and he will postpone his visit to Tuesday. Let him abandon his last hope; on Tuesday the Royal Academy also will be closed for the season. We share his perplexity at the curious unanimity with which the exhibitions, like the persons of a chorus, leave the stage at the same moment, and we demand his gratitude for pointing out to him the solitary exception to so general a rule. The collection of drawings in black and white, at the Dudley Gallery, still invites him, and, in the present dreary condition of the art-world, offers much that is interesting and noteworthy.

The present is the eighth exhibition in Black and White which has been held in the Egyptian Hall. At first these collections, appealing, as it was thought, entirely to the professional eye, were not much visited or cared for by the public. Most people consider themselves competent to express an opinion on a finished picture, but not many feel this with regard to a drawing, especially if that drawing is not interpreted in colour. But gradually people have found it amusing to recognize the originals of familiar designs in

novels and magazines, and to see their favourite grotesques from *Punch* as they left the artist's hand. It may now be said that the Black and White Exhibition takes a leading place among the minor shows of the year, and would be missed as much as any of them. To the artist it is of particular value; it gives the public and his fellow-craftsmen an unusually good opportunity of noticing the faults and merits of his draughtsmanship. Much that can be slurred over in colour, or rendered by mere *bravura* of the brush, must be drawn with a clear conscience, or left out altogether, and the ordeal of an exhibition of drawings in ink or pencil is a healthy one for a brilliant young draughtsman to go through. We do not find this year any strikingly new forms of talent; the familiar names present us with excellent work in the familiar style; but we are certainly struck with the increasing absence of thoroughly bad work of the old-fashioned smooth school. Our young artists, if they seem to be striking out no very novel path for themselves, are yet learning to wield the pencil and the pen with more ease and precision.

Among the landscape studies by far the best seems to us to be Mr. Aumonier's "Southwold" (102). It is a large work in charcoal, showing the old Suffolk town, built along the level slope of a low hill that sinks into the sea on the left of the composition, of which the church is almost the only salient feature. In the foreground the afternoon sun, reflected, lights up the waters of a reedy "broad"; a stormy sky, with strong lights in it, throwing the town and middle distance into deep shadow. The drawing is in Mr. Aumonier's best manner, and shows a certain refinement and melancholy sentiment which he seldom attains in his pictures of similar scenes, excellent as these often are. He is a good landscape painter, but with a crayon in his hand he is unrivalled. One of the best landscapes here is a little drawing, very badly placed, of "A Kentish Homestead" (410), by Allan Barraud. The name is unknown to us, but it is borne by an artist who possesses a singular power of rendering in black and white the silver radiance of clouds that have discharged their rain, and the liquid shadows of a dewy landscape seen against the light. The drawings of M. Léon Lhermitte need no recommendation. "Les Glaneuses" (14) represents a group of women, gleaning busily on a sloping field, the harvest of which has just been stacked. It is difficult to define the precise charm of this austere composition, in which nothing has been sacrificed to prettiness or to sentiment. The visitor should be careful to note all M. Lhermitte's contributions; each has some special merit of style, though all are not equally attractive.

Mr. J. W. Waterhouse takes the place of honour with his ambitious drawing of "A Greek Play" (221), and has some claim to the honour, on the score of careful execution. But the imitation of Mr. Alma Tadema amounts to plagiarism. It is pleasant to turn from this work to Mr. Walter Duncan's vigorous "Bacchic Dance" (202), which in feeling and composition, and almost in execution, is worthy of one of the Carracci. It consists of two half-length figures, a man with the pipes, a woman with the cymbals; the leopard-skin flaps on the shoulders of the man as he blows the instrument with fervour, and the woman, with her head on one side, seeks to out-do him in the frenzy of her brazen clangour. Close to this accomplished work hang a number of original designs, illustrating fairy tales, by Mr. Walter Crane. We do not think that any one will examine these, or the other similar contributions by the same artist which hang in the gallery, without a strong sense of regret that a talent once so fresh, fanciful, and eloquent should have degenerated into so nerveless a mannerism. These drawings show an increasing ignorance and indifference to the just proportions of the body, and even to the typical characteristics of the male and female figure. In his disregard of nature, Mr. Crane now gives to his men as to his women the same angular chin, the same narrow chest, the same wrinkled and attenuated limbs, and presents us with no more vitality of figure than the Dutch doll can boast of underneath its flowing drapery. Mr. Crane's failure at the Grosvenor Gallery this year ought to awaken him to the fact that a much stronger and more accomplished talent than his could not afford to ignore, as he seems to have been doing, all study from the living model. In contrast we must praise, as a learned drawing in the nude, Mr. James's study (169) in white chalk.

The etchings are less remarkable than usual this year. Mr. Whistler has a slight, but very effective, "Old Battersea Bridge" (314). The most pleasing of Mr. Tissot's contributions is "The Emigrant" (141), a young woman, with a brave countenance, stepping on board an outward-bound vessel, the back of the study being filled by a network of rigging. M. Léon Richeton is skilful at the technical part of etching, but his want of power to seize a likeness was never more strikingly shown than in his portrait of Mr. Carlyle (15). Mr. Seymour Haden and Mr. Hubert Herkomer seem to have left etching to conquer the neighbouring province, as Dryden would have said, of mezzotint. However, Mr. Herkomer contributes a single specimen of etching in his "Blind Shepherd." One of the most powerful works in this class is Mr. Heywood Hardy's "Head of a Buffalo" (297), the extraordinary vigour of which would be more happily presented if the water through which the animal swims were better drawn.

It remains to draw attention rapidly to the most remarkable of the miscellaneous studies still unnoticed. Mr. F. E. Cox has a delightful race after a calf (73), somewhat in the manner of Mason. Mr. Britten's studies for a picture of dancing (83, 109) need only a little more care to be very admirable. Mr. H. Stacey Marks, besides a humorous design representing the Dudley Gallery, as a nymph, receiving the Realistic, the Mediæval, the Intense, and so on, contributes two large drawings of a woman walking in a wood, listening to the birds (341), and of the same woman dipping her toe into a pool (358), neither of which is very successful. Mr. Matthew Hale's design called "Music" (346) is full of imagination and excellent in execution. The drawings of J. Jimenez y Aranda are *tours de force*, excessively clever, striking, and reprehensible; M. A. Lançon sends some excellent studies of lions and lionesses (429); Mr. T. Blake Wirgman shows his accustomed skill in a careful pen-and-ink drawing of "Mme. du Barry's Sedan Chair" (477). Mr. Rooke's "Drapery Studies" (559), for his pictures of King Ahab, in the Royal Academy of 1879, deserve attention for their delicacy of touch.

In the sculpture we find nothing that requires very extended comment. Mrs. Thornycroft, in her group of the Princesses Victoria and Maud (638), shows the delicate feeling for the grace and simplicity of childhood which has always marked her work. Mr. Mullins has done much better things than his terra-cotta entitled "Sympathy" (639), while Miss Chaplin, in her group of a cat licking a spaniel's face (641), shows her usual playful fancy and her usual lack of strong animal characterization.

THE BEND OR CASE.

THE Derby of the present year will be memorable for one of the most curious racing disputes in the history of the Turf. The general public like the greatest race in the world to be won by a great man, and they had every reason for satisfaction in this respect this year, as the owner of the winner was the Duke of Westminster. Racing is a tradition in the Grosvenor family, and this fact made the Duke's victory especially popular. Then it is considered most sportsmanlike to breed your own racehorses, and the Duke had bred the winner in his own paddocks at Eaton.

There had scarcely been a month's rejoicing over this happy state of things when a report was circulated that a mistake had been made, that Bend Or had not run in public at all this season, and that the Duke of Westminster had not won the Derby. At first people laughed at the rumour as an impossibility. It was said that no mistake could have been made about a colt which had been bred in the paddocks just outside the Duke's gates, and of course any idea of fraud was out of the question. Fortunately, too, the horse's trainer was a man of exceptionally high character. But in two or three days the report gained strength, and soon there was immense excitement among racing men, and even non-racing men, on the subject. The generally accepted story of the affair was as follows. Among other horses entered for the Derby, the Duke of Westminster had nominated two chestnut colts by Doncaster, one named Bend Or, out of a mare called Rouge Rose, the other named Tadcaster, out of a mare called Clémence. It was said that when the time drew near at which it was thought desirable to send the two colts (then yearlings) to the trainer's, they had not been in the best of health, and that they had been taken to a paddock at Newmarket for a change of air, before being put into training. It was when they were taken out of this paddock to go to the trainer's stable that the mistake, according to the rumour, was made. There were two chestnut yearlings, and the colt out of Clémence was said to have been mistaken for that out of Rouge Rose, so that the trainer subsequently ran Bend Or as Tadcaster and Tadcaster as Bend Or.

Improbable as this story appeared, there was said to be some evidence in its favour. The private stud-book at Eaton, according to the objectors, described the markings of the colt out of Clémence as similar to those now to be seen on the horse that came in first for the Derby; and, if this were accurate, that horse must have been Tadcaster, who consequently ran under a wrong name, and was disqualified for the race. The idea of the bare possibility of such a mistake having been made caused at first a kind of panic among racing men, who, remembering the leading principle of Turf law, that bets go with stakes, reflected upon the contingency of an entire resettlement of Derby bets. Many backers had won large sums by the victory of the Duke of Westminster's chestnut colt, and the prospect of refunding all their gains was to them far from inviting. They were, however, soon comforted; for, on carefully reading the second rule of racing, they found that, although it begins with the ominous words "The interest of the bets is inseparable with the interest of the stakes," an exception is made when an objection is lodged against a horse that has been the first to pass the post, on the ground of incorrect pedigree or nomination, "*after the race is run*," provided the horse "is of the right age, and that in other respects he has not transgressed the rules of racing"; and that the owner, "or a person on his behalf," has not succeeded "in starting him for a race for which he is legally disqualified," by fraud or false statements. In such exceptions as these "the bets shall go to the horse that comes in first." So far as regards bets, therefore, the backers of the horse which came in first for the Derby were assured. Nevertheless, if Tadcaster won the Derby, it was evident that a large sum would have to be refunded in the shape of stakes. First there were the Derby Stakes, which amounted to 6,375*l.*; and, as the colt had run under the same name as a two-year-old, he would be disqualified for every race that he won last year, when his gains came to something like 5,630*l.* Then,

although bets on his past races would probably rest undisturbed, there were the heavy bets already made on the approaching St. Leger to be considered; which would stand on a very different footing. During the Newmarket July meeting the case was mentioned to the Jockey Club, and the owners of the second horse in the Derby consulted the Club as to the desirableness of their making an objection against the winner. After examining several witnesses, the Jockey Club said that it was unable to give any advice in the matter, on account of the very conflicting character of the evidence at that time before it. The owners of Robert the Devil still hesitated, and their next step was to take counsel's opinion on the question. The barrister to whom the case was submitted advised them that they "had a case." A formal objection to the Derby decision was accordingly lodged at Messrs. Weatherby's by Messrs. Brewer and Blanton. The next stage in the proceedings was a trial of the case before the Stewards of Epsom races. Some fears were expressed that, even if that tribunal gave their verdict in favour of the Duke, the case might be taken into a court of law; but the objectors avowed their intention of submitting to the decision of the Epsom Stewards, whether it should be in their favour or otherwise. The trial of the case took place at Mr. Lowther's house in Grosvenor Street, and occupied part of four days. Many witnesses were examined, and the Eaton stud-book was carefully studied; the result of these deliberations being that the Stewards of Epsom unanimously decided that "the chestnut colt Bend Or, which came in first for the Derby of 1880, is by Doncaster out of Rouge Rose, and therefore the objection lodged by Messrs. Brewer and Blanton is overruled"; and thus ended what sporting writers have called "The Bend Or Difficulty."

It is needless to say that the result of this curious case has given general satisfaction; but, apart from the gratification which is felt at the Duke of Westminster's success, and at the confirmation of the victory so honourably gained by the gallant Bend Or, we think that there is another cause for agreeable reflections. Generally speaking, whenever there has been a Turf "difficulty," it has been caused by fraudulent proceedings or by sharp practice. Now, in the case under notice, with a Duke on one side and racing men on the other, the whole affair has been conducted in an honourable and straightforward manner. The inquiry was conducted in private, and we have no official knowledge of the evidence; but, as far as can be judged from the accounts given of the case in the public press, the principals on both sides acted in an unexceptionable manner. The Duke, on the one hand, placed his private stud book in the hands of the Stewards, and courted the fullest inquiry into the matter; the owners of Robert the Devil, on the other hand, consulted the Jockey Club as to the expediency of moving at all in the matter, and when that body refused to advise them, they consulted eminent legal opinion. Finally, they agreed to acknowledge the decision of the Stewards of Epsom races as final, instead of going on with the case in the law courts. We have heard it objected that Messrs. Brewer and Blanton ought not to have taken advantage of an unfortunate blunder to endeavour to wrest the great prize of the Turf from the hands of the Duke, when it was certain that, whether it was Bend Or or Tadcaster which first passed the post for the Derby, the winning horse was the property of the Duke of Westminster, and had been properly entered for the race; but it would be just as reasonable to blame a whist-player for taking advantage of an unconscious revoke on the part of his adversary when 6,000*l.* depended upon the points thus gained. People are not, as a rule, very scrupulous about availing themselves of legal technicalities, and it would be hard if men were expected to give up the chances of obtaining several thousands of pounds on account of chivalrous sentiments. It should be remembered again that, if Messrs. Brewer and Blanton had not objected to Bend Or, the owners of the second horses in some of his two-year-old races would almost certainly have done so. Some people seem to imagine that it was a straining of an unnecessarily severe law to object to Bend Or at all, but such an idea is obviously absurd. There are too many opportunities of fraud on the Turf, and of the two it is rather to be desired that the stringency of racing laws should be increased than that it should be diminished. Indeed we are half inclined to fear that the very suggestion of the possibility of such a mistake as was supposed in the objection to Bend Or may set inventive but dishonest minds to work upon the question of the expediency, under certain circumstances, of contriving to make such a mistake for fraudulent purposes.

Sporting writers have been bemoaning what they consider a very serious and evil consequence of the Bend Or dispute. Pending the settlement of the case—that is to say, for some three or four weeks—the St. Leger betting was partially paralysed. Racing men seem to have considered this to be a national calamity. It is possible, however, that there may be misguided moralists who might rather rejoice at it than otherwise. Complaints have been made in the newspapers at the exclusion of reporters from the room in which the Epsom Stewards deliberated on the Bend Or case. The presence of representatives of the press under such circumstances would have been contrary to all precedent. When gentlemen are kind enough to undertake the duties of stewards of race meetings, it would be hard indeed if their management of the business of those meetings were distrusted by the public, and it would be intolerable that reporters should claim admittance to their meetings.

REVIEWS.

WILLIS-BUND'S SELECTION OF CASES FROM THE STATE TRIALS.*

THIS is a work of such obvious utility that the only wonder is that no one should have undertaken it before. Mr. Willis-Bund speaks of it as "an attempt to supply a want which I have often felt in the course of teaching," and which we should think must have been felt by every one else concerned either in teaching or in learning history. "Again and again," the writer continues, "the question is asked, Where is the authority for such a proposition to be found? It is easy enough to say the Statute Book, or the State Trials, but to refer a student to either of those works has the effect of deterring him from ever again seeking for original information." Nor—the weakness of human nature being taken into account—can we very much blame the student. There is a legend of the First or the Second George getting into a rage with his Minister, and insisting upon the documents relating to a certain piece of State business being laid before him the next morning. The Minister obeyed; and when the King rose, he beheld three large waggons full of papers parked beneath his windows. Tradition says he consented to wrestle with the matter in an abstract. Such an abstract Mr. Willis-Bund has undertaken to provide for the historical student who is deterred by the sight of a waggonload of State Trials. And it is not to such timid souls alone that his work will be useful. With the best will in the world, it is not always possible for dwellers outside of London or the Universities to refer to Statutes or State Trials, or other such voluminous and unattractive works. They are not books with which a young man in furnished lodgings is likely to provide himself, or for which his landlady is likely to provide him with shelves. They are not thought necessary to the comfort of a young couple setting up housekeeping. They are not part of the stock of the ordinary circulating library; and even in libraries of higher pretensions books of this class are not always easily accessible. Perhaps the twenty or thirty volumes have remained for ages unsorted in a closet, and on touching they threaten to crumble into dust under the rash investigator's fingers. Perhaps, as we once discovered to be the case with the Journals of the House of Lords in an institution which averred itself to have been founded to supply "the requirements of scholars and literary men," they have been deposited in the cellar, where it seems as much out of the question to disturb them as if they were a fine old crusted port. Altogether, there must be many to whom such a work as Mr. Willis-Bund has undertaken will, if well executed, be, to use a favourite modern phrase, a great boon. And in many respects—we wish we could say in all—it has been well executed. No higher title is claimed for it than that of a compilation. "Original research into records and cases that are not reported in the ordinary books" the compiler has not attempted, his object having been, "not so much to seek out new materials, as to utilize old materials that are accessible to every one." The edition of the State Trials he has used is that of Howell, published in 1816, and of the Statutes, that by Pickering, published in 1763. In the case of the Statutes he has wisely given references, not merely to the pages of his particular edition, but also to the regnal year and chapter. We notice this with gratitude, because in Canon Stubbs's *Constitutional History* references are given only to the volumes and pages of the *Statutes of the Realm*, thus affording no help to the possessors of other editions.

The subject of the present volume is confined to trials for treason before the ordinary courts, from 1327 to 1660, cases of impeachment being left to be dealt with in a future volume. The work opens with an elaborate and interesting dissertation on the law of treason, which in its changes and development reflects the changing relations between the Crown and the nobility. "A severe law of treason meant a powerful monarch; a relaxation in the law a powerful aristocracy." The author however refuses to join in the praises so often bestowed upon the Barons for curbing the tyranny of the Crown by their resistance to additions to the law of treason:—

> That the conduct of the Barons indirectly acted in favour of liberty none will deny; that that was its primary object, or that any idea of liberty actuated the Barons, few of those who have ever studied their conduct, will assert. The history of the early law of treason is a question of money; the Barons did not in the abstract care what was or was not decided to be treason, but they greatly cared for the cases in which their property was or was not to be forfeited: and this it was that led them to oppose the development of the law of treason—they lost and the King gained the forfeitures; hence the jealousy with which any attempt to increase the number of treasons was regarded by the Barons; hence the frequent repeal of all fresh additions to the list of substantive treasons. It was not until the Crown learnt that there are two ways of developing the law, express enactment and judicial interpretation, and that if the one fails the other will succeed, that the law of treason became really expansive.

It may perhaps be thought that Mr. Willis-Bund hardly does justice to the antiquity of the law of treason when he goes on to say that its "starting-point . . . is the celebrated statute of William I., by which all freeholders were compelled to take the oath of allegiance to the King irrespective of the lord under whom

* *A Selection of Cases from the State Trials.* Vol. I. *Trials for Treason* (1327–1660). By J. W. Willis-Bund, M.A., LL.B., Barrister-at-Law, Professor of Constitutional Law and History, University College, London. Edited for the Syndics of the University Press. Cambridge: At the University Press. 1879.

they held their land." The germ of the law of treason is to be found in the legislation of Ælfred:—"If any one plot against the King's life, of himself or by harbouring of exiles, or of his men, let him be liable in his life and in all that he has." For the Conqueror's celebrated statute there was a precedent in the law of Eadmund the Magnificent, imposing upon all an oath of fealty in terms which expressly assimilate the relationship between King and subject to that of "lord" and "man":—"Ut omnes jurent in nomine Domini . . . . fidelitatem Edmundo regi, sicut homo debet esse fidelis domino suo, sine omni controversia et seditione, in manifesto, in occulto, in amando quod amabit, nolendo quod nolet." In this as in so many other cases the Conqueror did but develop and strengthen what he already found existing. Taking however William's legislation as the starting-point, we go on to the gradual definition of the law of treason, first by Bracton, and later on by that famous statute of the 25th Edward III. which the Lord Chief Justice of England is reported to have recently condemned as "lamentably ill-drawn." Next we trace the great extension of the law by the decision under Henry VI., "that the Act of Edward III. was a declaratory Act, and that there were common law treasons as well as those mentioned in the Statute." Under the Tudors the law of treason was developed into what Mr. Willis-Bund does not hesitate to call "a system of homicide." For the much-abused judges of the Stuart period the author makes a stout defence:—

Notwithstanding all that has been said and written against the cruelties of the judges under the Stuarts, if any one will take the trouble to examine the facts, he will find that the law of treason was on the whole more fairly administered under their rule than at any previous time.

We must not dwell longer on the introduction, interesting as it is. One thing surprises us, that though the author cites in full the Statute 3 Henry VII. c. 14, which made it felony to conspire the destruction of the King, or any lord, councillor, or great officer, he yet in his comments never notices the fact that it applies solely to the case of conspiracies by the King's household servants. To apply it to the King's subjects generally was more than its framers ventured upon, "lest," says Bacon, "it should have been too harsh to the Gentlemen, and other Commons of the Kingdom; who might have thought their Ancient Liberty, and the Clemency of the Laws of England invaded, If the Will in any Case of Felony should be made the Deed."

When we turn to the text itself, we find that it is more than a mere selection from or abridgment of the *State Trials*. The author retraces more fully the development of the law of treason, already sketched in the introduction; he recounts the successive statutes bearing on the offence, describes the course of events, comments upon the policy of the Government and the method in which the trials were conducted, often drawing upon sources not accessible to Howell, and adds some cases not included in that compilation. In many respects therefore, although the trials are more or less abridged, this is for the ordinary student's purpose not only a more handy, but a more useful work than Howell's. On the other hand, the fact that the trials are not given at full length—for even those which are said to be given "in full" are somewhat condensed—will prevent its superseding Howell altogether. We think too that it would have been better if, whenever Howell had indicated the source whence he derived his reports, Mr. Willis-Bund had done the same, instead of simply referring to the "State Trials," of which he speaks in a way which might lead the reader to suppose that it possessed some official character. When Howell has told us that his account of the trial of Colonel Eusebius Andrewe is that "published by Francis Buckley, Gent. who was . . . . an Eye-witness of all the bloody and execrable Proceedings," or that the account of the trial of Mr. John Lilburne is "written (the chief part) by the said John Lilburne," why should not Mr. Willis-Bund repeat the information? He has done so in Penruddock's case, Penruddock having written his own account partly in the first person. The knowledge of the source of the report is not unimportant, as there is clearly some difference between an official report and one put forth by the prisoner or his friends. In some of the cases we are struck by the frequent variations between the account given by our author and that of Howell's edition of 1816 to which he refers. He may, of course, have corrected Howell by the light of some superior authority; he may have sufficient reason for turning the Major Cobbet and Captain Far who appear in Christopher Love's case, into Major Corbett and Captain Fox. But sometimes Howell's version is so much more intelligible than that of Mr. Willis-Bund that we cannot but prefer the older compiler. The point of one of Coke's witticisms, such as it is, is lost when it appears as "Concerning this sect, their studies and practices principally consist in two *acts*, to wit, in deposing of Kings and disposing of kingdoms." It should no doubt be, as it is in Hargrave and Howell, "consist in two *ds*." Coke was evidently much in love with this ingenious alliteration, for on the next occasion he improved and expanded it, describing Garnet as "a doctor of Jesuits, that is, a doctor of five D.D.'s, as dissimulation, deposing of princes, disposing of kingdoms, daunting and deterring of subjects, and destruction." Here Mr. Willis-Bund omits the word "five." At p. 387 one of Coke's most flowery passages in praise of the King and Queen has been spoiled by running together two sentences which in Howell are distinct. Further on, Howell's account has been so abridged as altogether to obscure Coke's meaning:—

After some little discussion he [Sir Everarch Digby] pleaded guilty, made a speech setting out the motives that led him to join the plot, and concluded by asking that his punishment might be confined to himself. . . . The Attorney-General replied very briefly, "for it grew now dark," setting out Digby's friendship with Catesby, his religion, error, and heresy, *his previous idle rare presumption*, his fear, and false alarm, concerning his recusants.

Some further knowledge of Digby's previous speech would be necessary for the understanding of Coke's reply, even if it had been more accurately given. The unfortunate man had urged that the motives for his offence were at least not base—he had been moved by friendship for Catesby, by religion, by resentment at the broken promises of relief, by fear of yet harder laws against recusants to come. Coke proceeded to demolish him in sledge-hammer style, taking his pleas one by one:—

1. For his Friendship with Catesby, that it was mere folly and wicked conspiracy. 2. His Religion, error and heresy. 3. His Promises, idle and vain presumptions, as also his Fears, false alarms, concerning wives that were recusants. . . .—2 Howell's *State Trials*, 188.

We give this as it stands in Howell, though we have no doubt that the words "concerning wives that were recusants" should begin a new sentence. But the general drift of Coke's argument is plain enough here, while in the new version it is lost.

In Garnet's case it is possible that Mr. Willis-Bund may be drawing upon some more trustworthy account than the official relation reprinted by Hargrave and Howell. But if so, he should have named his authority, as his variations from Howell, to whom alone he refers, are not inconsiderable. We will only mention the most important. He makes Garnet say of the Pope's power to depose princes, "that all Catholics accepted it without question." In Howell the words are, "That this doctrine of the power of the pope, was by all other Catholick princes *tolerated without grievance*," which is more to the purpose, as tending to show that, in practice the doctrine was not found incompatible with a subject's duty. This version moreover in substance agrees with the account by Father More, given in Butler's *Historical Memoirs of the English Catholics*. Further down, in the book before us, Garnet says that "As to the Jesuits being privy to treason, it was impious to think that they were; he had asked some of them if they were privy, but they always denied it." If the very thought was impious, how came Garnet to ask such a question? In Howell his answer is logical. "Concerning the Jesuits, he said, That if any were privy to such horrible treasons, it was impious, especially in men of their profession: but said, that he talked with some of them about it, and that they denied it." At a later stage of the trial Lord Salisbury pressed Garnet as to a conversation with a brother Jesuit, Oldcorne or Hall, from whom five applications of the rack had wrung a confession:—

He [Salisbury] then reminded Garnet of what took place after his conversation with Hall had been overheard, how he denied this before the Council; that Hall had confessed with so many detestable execrations that it wounded their hearts to hear, and when Garnet heard that Hall had confessed, he asked for mercy.

The parallel passage in Howell is somewhat awkwardly worded, but a careful reader cannot fail to see that the "detestable execrations" were used by Garnet to strengthen his denial, not by Hall to support his confession, which the Government were only too glad to believe. It was Garnet who "stiffly denied it upon his soul, reiterating it with so many detestable execrations, as the earl said, it wounded their hearts to hear him." It was the knowledge, derived from Hall's confession, that these execrations were uttered in support of a falsehood which so wounded the tender hearts of the Lords of the Council.

Our readers will probably be weary of following out these small discrepancies, and we will therefore only mention some of those which arise in one or two of the cases under the Commonwealth and the Protectorate. It is but fair to say that, as far as we have tested, the errors are confined to a few only of the many cases given. In the trial of Gerhard and Vowell, who were executed for a conspiracy against Cromwell, Mr. Willis-Bund represents a witness as saying "That Hinshaw sought to engage Vowell, but thought himself to be unfit." In Howell this runs, "That Mr. Hinshaw sought to engage Mr. Vowell, but he answered that 'he thought himself to be unfit.'" We need not enter into explanations of the parts played respectively by Hinshaw and by Vowell in the conspiracy. It is enough to observe that in the one version it is Hinshaw, in the other it is Vowell, who hangs back from active work. In the trial of Christopher Love in 1651 for treason against the Commonwealth, we read that "Keeble [the Lord President of the High Court of Justice] addressed Love, and told him if they were to have a Presbyterian Government it might tend to the peace of the nation, but not with a Scotch *servitude* or *united* by a Scotch covenant." It should be "not with a Scotch *limitation*," "nor *limited* by a Scotch Covenant." Love is represented as saying in his defence, "Had I been so hardly dealt with before the King's Court, I should not so much have wondered at it; but to be so dealt with at Westminster, I stand amazed." But in Howell his indignant protest is more pointed:—"Had I been so dealt withal at the juncto at Oxon, I should not have been so troubled at it; but to be dealt so with at Westminster, this is that at which I stand amazed." Whether by "the juncto at Oxon" he meant the Royalist Parliament which had sat at Oxford, or whether he was referring to those who had expelled him from the Congregation House at Oxford—an incident in his past life which he had already cited as an instance of his sufferings in the good cause—is not clear; but at any rate the contrast lay between Oxford and Westminster, between the Cavalier and the Puritan stronghold. Two points moreover in the case are

not quite accurately given. At one stage the Court had a long wrangle with a witness, one Mr. Jacquel, who, when the oath was read to him, would only lay his hand on his buttons, and say "he was as good as under an oath." Mr. Willis-Bund represents that upon this Keeble admitted him to give evidence. But from the account in Howell it appears that "the Court not being satisfied with that answer, pressed him further," until he was at last got to say that he was under oath. The author also seems to have passed over the point of the Attorney-General Prideaux's reply to the technical exceptions taken against the charge. Love, it must be remembered, was being tried before that iniquitous invention of the Commonwealth, a High Court of Justice, the members of which were both judges and jurors. The Attorney-General argued that the proceedings were in the way of impeachment, "and, I think, that in this way of impeachment, we are not tied to those very nice and strict formal rules upon indictments." Hale, one of the prisoner's counsel, would not admit the distinction. "Then Mr. Attorney makes a difference between the case of an Indictment and this Charge. I conceive that in this case there is no difference." All this is slurred over in the present version. In Howell, moreover, Prideaux is not so brutally frank as he is here made out. "The Attorney-General," writes Mr. Willis-Bund, "said if he was to draw indictments with all these niceties he should never get a conviction." This no doubt was what was in his thoughts, but we cannot find the words in Howell. "Mr. Hale's Exception," he there complains, "is still upon that way of proceedings upon indictments. . . . I must give it that answer still, that if you do in these cases put me to it, to express every particular circumstance of every particular fact, and every particular time, and that it must conduce in the conclusion of it, I must make you impeachments that will not be fit for you to read, nor hear." The nearest approach we can find to the words ascribed to him by Mr. Willis-Bund occurs later on, when he says that if he had laid the charge as Hale demanded, "I conceive I had done myself and the commonwealth wrong."

These are no doubt minute points. But in all legal matters minute accuracy is indispensable. If Mr. Willis-Bund's readers find that they may still have to refer to Howell for exact details, his work, however much valuable information it contains, will have failed of its main purpose. And though some of the variations may have been made with intention, others certainly look like simple mistakes arising from careless abridgment. That the author can be careless is shown by a remark referring to one of the regicides, Sir Henry Mildmay. After the Restoration, Mildmay presented a petition to the Lords, setting forth that his only object in sitting in "that pretended high Court of justice" had been to preserve the life of "His late Majestie of blessed memorie." To this not very credible plea, Mildmay added a medical certificate that the state of his health was such that if the sentence of drawing him on a sledge from the Tower to Tyburn were put in execution, it would endanger his life. Upon this Mr. Willis-Bund comments, "As the object of the journey to Tyburn was to deprive him of life, this certificate almost approaches the humorous." The reply that suggests itself is that Sir Henry understood his own business better than his censor. A reference to the Act of Indemnity and Oblivion would have shown our author that Mildmay was one of the excepted persons who were "reserved to such Pains, Penalties and Forfeitures, *not extending to life*, as by another Act intended to be passed for that Purpose shall be imposed on them." Mildmay's life therefore was protected by the Indemnity; but one of the pains and penalties afterwards imposed on him and others in the same category was to be drawn to Tyburn and back, after the manner of traitors. Readers of Pepys may remember how on January 27, 1662, the diarist, "going to take water upon Tower-hill," "met with three sleddes standing there to carry my Lord Monson and Sir H. Mildmay and another, to the gallows and back again, with ropes about their necks."

Mr. Willis-Bund endeavours to disarm us by apologizing beforehand for possible inaccuracies, pleading that "no amount of care in a book of this nature could prevent some errors creeping in." We think however that we may fairly demand more care than he seems to have exercised. His work is one of such utility, and in many respects so well executed, that we trust that in a second edition he may repair the errors we have pointed out, and that he may continue it in a manner that we can unreservedly praise.

THE SONG OF ROLAND.*

IT is becoming a graceful and pleasing fashion with our poets to present in English dress those once neglected French works which were the delight of the centuries "before Malherbe came." The practice is one on which we ought every way to congratulate ourselves. The translators have a mine of wealth in which they may quarry continually, and always find something fresh, quaint, and delightful; and without their efforts the world might never know the meaning of *Fabliau*, *Chanson*, or *Lai*. We can hardly, even by the utmost stretch of a kindly imagination, assume that the ordinary English reader is likely to know anything of the labours of Michel, Meyer, Gaston Paris, Léon Gautier, and others who have annotated and edited the *Chanson de Roland*. It is true that the thing might be overdone; there are many other *chansons de geste*, but we are quite satisfied with the earliest, which is at the same time one of the shortest; there are also many "Epics of the Middle Ages," to read which would require the long life and leisure of a patriarch; these were best left in their original tongue; and of *ballade*, *villanelle*, *virelai*, and *chant-royal* we have already had well-nigh enough.

Of the three principal cycles of the *Chanson de Geste*, the earliest and best are those which have the Great King Karl as their central figure; and of these the earliest and best is the *Chanson de Roland*. As regards the date of the poem, the MS. of the Bodleian is in the language of the eleventh or twelfth century; its author is unknown, although the last line says,

Ci falt la geste que Turoldus declinet.

Unfortunately, however, the meaning of the word *declinet* is not quite clear. The origin of the song may, according to a theory in itself by no means improbable, be looked for in those *cantilènes*, a collection of which was formed for Karl, and in which the French sang the prowess of their warriors. Each of these *cantilènes*, of which none in the original French form survive, celebrated one exploit; it was short, direct in diction, and rapid in movement; the compiler of the *chanson* had his materials ready to his hand in story and in verse; he fitted the former with episodes, and filled out the principal characters; he took as much of the latter as was apt to his purpose, and amplified the descriptions; where his predecessors mentioned a fight, he described it; when they spoke of valorous deeds, he told of them in detail. Subsequently, as seems only fair, the poet himself became subject to amplification in the hands of his successors. The later MSS. of the Roland song, for instance, are full of expansions, additions, and *remaniements*, so that the suspicion arises that there may have been "editions" of the poem still earlier and much simpler even than that of the Bodleian Library. The tedious episode of Baligant, for instance, which Mr. O'Hagan judiciously omits, seems to us distinctly a later addition to the original poem, which must have dealt simply with the disaster at Roncesvalles, and the revenge taken by Karl. That the date of the first poem or *cantilène* is older than the twelfth century is not indeed difficult to show. What, for instance, was that song of Roncesvalles which was sung by Taillefer at Hastings? No one certainly ever supposed that he sang the long *Chanson de Roland* through; but there are passages in the poem as it stands which he might very well have sung before the army. Such, for instance, is the exhortation of Turpin. Again, the poem is full of that Saracenic terror which belongs to the tenth rather than to the eleventh and twelfth centuries, when the rage against the infidel of Spain was transferred by pilgrimages and crusades to rage against the infidel of Syria, Egypt, and Asia Minor. Yet the later rage—the enthusiasm of the Crusades—appears for the first time in the very last stanza, where Karl is bidden by an angel to go help "King Vivien fighting in the city of Imphe (query Nymphe, *Nymphæa*, or Antioch?) against the Saracens." Comparison with the romances of the twelfth and thirteenth century, again, tends to prove the earlier date of this *chanson*. Its language is more simple and direct, its stanzas are shorter, its assonant rhymes are not dragged along to such a merciless length; the general reflections are fewer, the characters are more heroic; their virtues and vices are different from those of the more courtly Crusaders; they are not French, but Germans of the type of Tacitus; they loathe peace, love fighting, are free in speech, and ready of hand; their most sacred duty is to obey their King; treachery is the greatest crime; they are ready to shed tears, to pluck their beards, to swoon with grief; they vaunt their own prowess; they love each other as Achilles loved Patroclus, or David loved Jonathan; Roland, the noblest and bravest, would die rather than by one blast of *Oliphant* seek needless assistance of his king; their fighting bishop assoils them of their sins, and enjoins them by way of penance to strike—*férir;* and those who die, he says, shall have seats in "the greater Paradise." Thus, while the internal evidence of the poem proclaims its antiquity, it affords us a complete view of the life of the Franks, the warriors and conquerors.

For this reason alone it deserves to be studied. But there are many other reasons. We may point out, for instance, the great figure of the King. He is no longer young in the *chansons;* he is *à la barbe chenue*, a greybeard, but in vigorous old age; there is no king like him, nor will be again till God judge the world; he habitually takes counsel of an angel; he stays the sun in its course, until his vengeance is complete; even in death he sits sword in hand menacing the infidel; he is grave and calm, even when his peers are carried away with wrath; he is heavily burdened with the cares of life;

Deus! dist li reis, si penuse est ma vie!

He loves his soldiers, and weeps for their death; he is implacable to traitors; he hangs all Ganelon's family after he has torn their chief to pieces. Great, indeed, must that king have been who left behind him such a memory as Karl. The poem might also be considered in its relation to the history of French literature. We might stop to show how in parts it attains to a pathos never reached in the more elaborate poems which succeeded it; how the dignity of the barons, their courtesy and simplicity, stand out naturally and without effort; how truthful is the poem. Or we might consider the work in its relation to the growth of the language. We are as yet, for instance, far from the ease of Mario

* *The Song of Roland.* Translated into English Verse by John O'Hagan, M.A., One of Her Majesty's Counsel. London: C. Kegan Paul & Co. 1880.

de France; the language is rugged; the poet has not yet acquired full mastery over the tongue. These, however, are only some of the reasons which make this *chanson* remarkable.

The total neglect of early French literature was so great in the seventeenth and eighteenth centuries that we are not surprised to find the *Chanson de Roland*, with all its followers, completely forgotten. It is only a hundred years since a French *savant* imagined that the song sung by Taillefer was a kind of modern lyric, and actually, to everybody's admiration, proposed a song such as might have been written by Collé or Favart. It is true that such rare scholars as Ducange and Sainte-Palaye knew something about the poem, though not much; but when in 1837 Francisque Milhel first published the Oxford MS., the surprise and delight of France were as great as if they had chanced upon another Homer. "We have," they cried, "our own Homer—Roland is Achilles; Turpin is Calchas; Olivier is Patroclus. Henceforth let no man taunt us with being without an epic."

The first difficulty in rendering the *chanson* is of course that of the most fitting metre. It is written in decasyllabic verse, and is divided into *laisses*—leashes or stanzas—which vary in length from twelve to thirty lines, with assonance instead of rhyme. Mr. O'Hagan offers us a specimen of what his translation might have been had he followed the example of Mr. MacCarthy in his renderings of Calderon, or M. Petit de Julleville in his version of the *Chanson*, in preserving the assonance. The example is such as to leave no room for regret at his choice. The metre he has selected, that of "Christabel," seems to us, on the whole, the best possible, although it is naturally open to objection. The "mixed iambic and anapæstic measure" has fallen, as Mr. O'Hagan frankly states, into "much discredit as a lilting metre.' This is probably due to the readiness with which it lends itself to the narrative verse in which the imitators of Byron and Scott found the ease which they mistook for genius. But we entirely disagree with Mr. O'Hagan when he thinks that the Song could be "beautifully rendered" in those heroic numbers which Keats and Morris have managed with so much sweetness and freedom. Mr. Morris might, to be sure, clothe the story of Roncesvalles in his own verse, as he has already done for certain *fabliaux*, but that would not be a translation. Or the Laureate, as Mr. O'Hagan suggests, might make it the subject of another "idyl," but that again would not be a translation. The most obvious objection to the metre is that it occasionally destroys the severity, simplicity, and directness of the original, and this not always by expansion, but sometimes by compression. Thus, when the Archbishop absolves the host before the fight in which they are all to be slain, his words are these:—

> Clamez vos culpes, si preiez Deu mercit
> Asoldrai vos pur voz anmes guarir:
> Se vus murez, esterez seinz martirs;
> Sieges averez el greignor parëis.

which is thus rendered by Mr. O'Hagan:—

> Cry *mea culpa* and lowly kneel;
> I will assoil you, your souls to heal;
> In death ye are holy martyrs crowned.

Everybody must feel that a direct loss of strength is caused here by the compression of the last two lines into one. It would be easy to criticize individual passages; one can hardly compare any stanza of the English with the original without noting some loss; for instance, when Alda goes to ask of the King where is Roland, her betrothed, Karl says:—

> Soer, cher' amie, de hume mort me demandes,
> Jo t'en durrai mult esforcet exchange;
> Ço est Loewis mielz ne sai à parler,
> Il est mes filz e si tendrat mas marches.

This passage seems very inadequately rendered by—

> "Dear Sister, gentle friend," he said,
> "Thou seekest one who lieth dead.
> I plight to thee my son instead—
> Louis, who lord of my realm shall be."

It is not, however, fair to judge of a translation by detached passages. We are bound to say that the result, as a whole, is satisfactory. We have here for the first time an English version of this noble poem; it is so far an adequate version that it preserves in the main the spirit of the original, and carries us away to the strange old time when the "middle ages" were as yet only beginning. It will serve as a guide to the beginner in early French literature, and will be read with pleasure and profit by those who have not the time or the inclination to embark in that delightful study.

It remains to be said that the disaster of Roncesvalles is historical. Here, in the year 778, Karl lost the rearguard of his army, Roland Hruotlandus, Prefect of the March of Brittany, being killed among them by an attack of Basques, not Mohammedans; thirty years later an army under Louis le Débonnaire was cut to pieces in the same place; and in five years afterwards another French army was defeated in a gorge of the Pyrenees by these savage mountaineers. A threefold disaster of this kind could not but impress profoundly the mind of France. This impression is described in the *Chanson* in a passage as poetical, and perhaps as well translated, as any in the whole poem:—

> Now a wondrous storm o'er France hath passed,
> With thunder-stroke and whirlwind's blast;
> Rain unmeasured, and hail, there came,
> Sharp and sudden the lightning's flame;
> And an earthquake ran—the sooth I say,
> From Besançon city to Wissant Bay;
> From Saint Michael's Mount to thy shrine, Cologne,
> House unrifted was there none.
> And a darkness spread in the noontide high—
> No light, save gleams from the cloven sky.
> On all who saw came a mighty fear.
> They said, "The end of the world is near."
> Alas, they spake but with idle breath,—
> 'Tis the great lament for Roland's death.
>
> Dread are the omens and fierce the storm,
> Over France the signs and wonders swarm;
> From noonday on to the vesper hour,
> Night and darkness alone have power;
> Nor sun nor moon one ray doth shed,
> Who sees it ranks him among the dead.
> Well may they suffer such pain and woe,
> When Roland, captain of all, lies low.
> Never on earth hath his fellow been,
> To slay the heathen or realms to win.

THE DUKE OF ALBANY'S HIGHLANDERS.*

THERE is one additional objection to the stupid practice of publishing novels in three volumes which we have never seen mentioned, but which is worth consideration—the circulating library subscriber's grievance. A person in the country subscribes to Mudie's at a rate which entitles him to get so many volumes at a time. Three of these volumes may turn out to be substantial and separate octavos, each affording a good deal of reading, and so giving the subscriber a fair return for his money, at any rate in quantity; but the three volumes may be those of a novel such as the one now before us, printed in very large type, and with a very wide margin, and containing only as many words as, if printed in a reasonable way, would make a very small octavo. Three volumes of this sort may be read with ease, in one sense, in a couple of hours. Then the subscriber has all the trouble and expense of returning his box and changing the books. Printed on the same scale, a book such as *The River of Golden Sand* or *Senior's Conversations*—to take two books much in request just now—would run out into about fifteen volumes each, which the subscriber would have to get down in successive batches. It must be difficult to find an adequate reason for maintaining this exceptional practice with regard to novels, which would at once be seen to be absurd if applied to any other class of books. It may be urged that many novels would not pay for publication unless printed in this expensive form, to which the obvious reply is that it would be an undiluted benefit if the greater number of novels now published were suppressed. These works cost the libraries about six shillings a volume, and perhaps, in the present state of the book trade, it might be difficult to replace them by other books as cheap. What the circulating library requires is a certain number of volumes to circulate, and novels are, on the whole, cheaper per volume than anything else. But this view leaves out of count the room for expansion which the book trade offers if intelligently worked. The amount of business which the circulating libraries do is quite trifling compared with what they might probably do by a better system, inviting a larger circle of subscribers by giving the subscriber more for his money. Readers, authors, and publishers would all gain by the change. As Mr. Matthew Arnold lately urged, there is a great future before authors—that is, authors who deserve to have a future—if the cost of books can be reduced to the reading public; but one class of books will be extinguished—namely, the fatuous novel. The good novel should prosper. To which category the novel we now have on hand belongs may be gathered from the following analysis of its contents.

The Earl of Abercairnie has two daughters, one exquisitely beautiful, but silly in proportion; the other magnificently handsome, but a devil in petticoats. The one is beloved by Charlie Oliphant, the other by Captain Duncan Daljorroch, officers of the 72nd Highlanders. The London season is not over, but the Earl and his daughters are at Abercairnie Castle, for "certain cogent reasons"—namely, that the Earl is desperately in debt and in fear of arrest, from which we are to infer that he is not a representative peer. Abercairnie is near Stirling, where the officers are quartered, and the Earl rides out with one daughter and the Captain, leaving the other daughter alone at home when the subaltern comes to call; the Earl, who is described elsewhere as a dragon of strictness, being in the habit of allowing his daughters when alone to receive visitors from the barracks, who, for their part, as appears from mention of their clanking spurs and jingling swords, seem to have been in the habit of riding about the country in uniform. Although the Earl is in such desperate straits for money, he still has his little comforts about him. "The room in which they sat"—the Lady Auriel and the Lieutenant—"though its fittings might be excelled by those of many another mansion in the country, by its aspect"—apparently an east one—"might well dash the confidence of a penniless lover. It showed masterpieces of art in cabinets, lounges, and enamels, and more than one exquisitely tender Greuze, and striking Boucher, peeping out between the rich hangings. . . . A *jardinière* with rare exotics stood in the deep recess of the centre window, and on a pedestal of Rosso antico, were Louis XV. and Madame de Pompadour dancing a minuet, worth many more guineas than Charlie ever possessed at once in his life." From which it may be gathered that the

* *The Duke of Albany's Own Highlanders*. A Novel. By James Grant, Author of "The Romance of War." London: Routledge & Sons. 1880.

Earl, notwithstanding his difficulties, had not hit on the obvious remedy against the threatened visit from the bailiffs, of which he was in daily expectation, by sending some of these costly articles to Christie and Manson. However, the room was a pretty one for making love in, and the charming Lady Auriel, like many another high-born damsel, knew how to put a lover at his ease, for she opened the conversation by saying, "I wonder you don't prefer the cavalry. You have seen my cousin Sidney in his Hussar uniform, and is it not handsome?" The tact and good taste which dictated this pretty speech to an officer of "the Feet" are just what might be expected from a girl who is as charming as beautiful. But the lover replies that his fortune gives him no choice, stoutly adding, "So far as costume is concerned, I think that the combination of the British uniform with the garb of old Gaul makes the most striking dress in the armies of Europe." However, although she can say pert things, the young lady can also encourage her lover, for she has a soul equally above money and good sense. But the Earl's daughters are made to understand by their father that they must marry for money, and the haughty Lady Augusta accepts the *parvenu* Captain Daljorroch, who apparently agrees to pay off the Earl's debts in consideration of the honour; the lady going through the business of accepting her lover in the style of the villain in a melodrama, who gnashes his teeth, and says, "But I must dissemble"; Captain Daljorroch, who is described as a shrewd man of the world, behaving throughout like a perfect simpleton. Charlie, not being, like the Captain, a man of enormous wealth, is snubbed by the Earl, and goes off to join his regiment in India. The troop ship in which he sails appears on this occasion to have taken out a miscellaneous assortment of passengers, amongst others a Parsee merchant, and picks up by the way an Afghan prince in disguise, wandering about the ocean on a raft, who forthwith takes service as Charlie's bearer. But a still more wonderful incident is the pursuit of the vessel by a shark, which, regardless of the danger of getting caught in the screw, keeps in the wake of the steamer until caught by the sailors. Charlie joins his regiment just in time to take part in the Afghan campaign, the 72nd forming part of General Roberts's force which carried the position of the Peiwar Kotal, of which exploit we have here a new and perfectly original account. A writer the other day suggested that, if we would only take Herat, England would soon do a splendid trade in pistachio nuts; but our author here goes further, for he makes the officers of the 72nd enjoy "a jar of Cabul wine" for their evening meal, the wine "flavoured so like Madeira that you can scarcely know the difference." Why not, when you are about it, have made our gallant sailors take part in the affair, and describe the position of the Peiwar Kotal as carried by a bombardment of British gunboats? The Afghan prince lately cruising about the Arabian sea on a raft, and afterwards Charlie's runaway servant, now of course comes out strong; he is in and out of the British camp, like Cerberus, three gentlemen at once, suborning our Mussulman Sepoys by means of "mantras," which is as if one were to lead Dr. Cumming about by dangling a photograph of the Pope before him. In one sense our author is only too conventional, as when he says that "the artillery got ably into position at 3,000 yards range, and a terrible exchange of round shot and shell took place almost the entire day. But, singular to say, the attacking party met with scarcely a casualty; and during an eight hours' fire our artillery only paused at intervals to cool their guns." The advance of the 8th Foot is described as taking place:—

> Colours advanced and bayonets fixed—point over point, and flashing in the sun. Many rolled clattering down, killed or wounded, into the chasm. Pith helmets falling one way and rifles another—some retaining the latter with a tenacious grasp; but a wild cheer announced in a moment more that the place was won. For the attack had been made by the bayonet—the grand old British weapon that never fails.

As well describe a man driving a four-in-hand up Snowdon as a column marching up the Peiwar Kotal with bayonets fixed "point over point." As a matter of fact, not a bayonet was fixed on the occasion, nor was the position carried by that grand old weapon, for the excellent reason that the storming described never took place, the ridge having been abandoned by the Afghans before the 8th Foot got there. We believe it is correct to say that the gallant regiment did not sustain a single casualty on this occasion.

Charlie, who was with another part of the force, escapes unhurt from the scene of carnage to lose himself the next day, and in his efforts to find the British columns, he goes through a number of surprising adventures, in which a certain Afghan is always appearing ubiquitously, no matter where Charlie may be going, and is always getting shot by Charlie or knocked over by him, or trampled upon by Charlie's horse, yet always turning up in a ravine or nullah next day to take vengeance on Charlie, still wandering about in search of General Roberts's force. Imagine a person put down in Hyde Park and spending several days trying to find the Wellington statue, and you have some idea of the difficulty of finding Roberts's force in the Koorum Valley. But Afghans were not the only sources of danger in that country. An unmistakable sound of growling and crunching among the jungle was followed by the appearance of a couple of wolves rending a dead horse, a sight so appalling that Oliphant had scarcely need to put the spur to the animal he rode. Naturally, the episode made the wanderer more than ever anxious to see "the white tents of General Roberts's camp Indian wolves gorged with food being notoriously disposed to attack a man on horseback. But there are creatures more terrible than even wolves in those parts. As Charlie bivouacking out, "more than once the odious cry of the jackal rang out upon the night, and made him start and grasp his revolver." Had Charlie been stationed at Calcutta he would have had a bad time of it, for the jackals are much more common there than in Afghanistan. And, while the author is piling up horrors, it is a pity he did not say something about the rats and the fleas, both of which are more commonly met with in the Koorum Valley than jackals or even wolves. However, escaping both wolves and jackals, Charlie next morning is waylaid by a party of "Khels" as he is about to cross a ford, still in his search for Roberts's column. "'Rabbi 'lalamina,' exclaimed one"—of the Khels—"joyously, using that tremendous first word of the first chapter of the Koran," and proceeds with the others to take Charlie prisoner, first firing away several rounds of ammunition at him. Charlie, however, is rescued from death by Ferozoodeen Khan, the Afghan prince, late Charlie's bearer, and ex-navigator of the Arabian Sea, already referred to, who carries him off to his own home, and sets his two wives to wait on the visitor, as is the custom of Afghans. It only wants that the ladies should be described as driving about Cabul in a Victoria, and giving a five-o'clock drum, to make the tale a perfect picture of Afghan manners. And Charlie, who, although fresh from England, finds not the smallest difficulty in conversing in the Pushtoo language, is made furious love to by one of the wives, presently strangled by her husband—Charlie witnessing the murder calmly, and raising no difficulty. Eventually Charlie escapes from his prison, as was only to be expected, and at last does find his way to Roberts's camp, where his adventures naturally excite a good deal of astonishment. He has now been shot at, stabbed at, ridden at, ambushed at, and generally so hair-breadthly escaped, that it is hardly fair, when he does get back to Roberts's camp, to finish him off by the unromantic, if original process, of being trampled upon by a commissariat elephant gone "must." Not, however, that he is killed even now; Charlie has as many lives as a cat, or the Afghan prince above referred to, and although the "infuriated animal seized him up in his trunk and dashed him with violence to the ground, and . . . taking up the body of Charlie, who was quite senseless now, hurled it among a crowd of camp-followers," Charlie managed to get round, although considerably shaken, and returned home to find that the Lady Auriel had just married a certain Sir John Lennel, who appears to have been an excellent person and a kind husband, but whose interference made his visit to England disappointing to Charlie. If you are to go in for this sort of thing, it is as well to be amusing, which we cannot say we have found this book. On the whole, we prefer our old friend Baron Munchausen.

HISTORY OF RUSSIA.*

In spite of the recently awakened interest in the Russian Empire—an interest very genuine, if rather hostile—the ignorance as to Russian history is almost as general as ever. Every one can read French, and many people can read German, yet such standard books as the French translation of Karamsin, the great national historian, Schnitzler's *L'Empire des Tsars*, Rambaud's various works on Russian history, Bernhardi's *Geschichte Russlands*, and many more, are unknown names to ninety-nine out of every hundred cultivated Englishmen. Of course it may be said that laziness and disinclination to move out of a prescribed groove of reading are at the bottom of this ignorance; that to read a book in a foreign language, however familiar it may be, is always more of an effort than to glance over a work in one's native tongue. It is not so easy to take the sense in with half an eye, mental as well as physical, keeping up a conversation perhaps the while, on the comparative merits of the French and Dutch plays, on of the superiority of the new to the old Government. Then, again, many people's idea of studying history is to slide gently from one proper name to another, each of these names calling up the events connected with it. Thus a man may have his memory refreshed as to a certain episode by merely seeing "Elizabeth," "Essex," "Bacon," "Raleigh," before him on the page; but how if the names happen to be "Alexis," "Nicon," "Morozof"? Whatever we may choose to assign as the reason, the fact remains that the public are ignorant, and choose to be ignorant, of the history of Russia. Mr. Mackenzie Wallace has done his best to awaken an interest in its customs and institutions, and Mr. Ralston has given us an admirable account of the welding together of all the many elements until the Russian nation was formed; but there is still room for a short connected account of the Russians from the earliest times up to the present day, and this Mr. Gossip has endeavoured to supply in the little book before us. In some respects he has done his work well. He has taken great pains to have his facts correct, and he has sketched a plan for himself which, if he had carried it out, would have developed into an admirable history. Unfortunately it is easier to sketch plans than to execute them. There is a want of proportion in his way of treating his subjects that is fatal when he is dealing with things which are not perfectly familiar; and his facts, though correct in themselves, occasionally become, by a false relation with what has gone before, either dwarfed or exaggerated. For instance, he

* *History of Russia.* By R. Gossip, Author of "Turkey and Russia; their Races, History, and Wars." Glasgow and London: Collins & Sons.

devotes seven pages to the history of the first false Dmitri, while he is silent as to the great part played by the Lithuanian princes of the fourteenth century, in whose hands Kief, the mother of Russian cities, remained for four hundred years. He is diffuse about Ivan IV., as to whose existence English readers generally have some faint glimmerings of consciousness; but he rather alludes than refers to the struggle in which Ivan III. crushed the republican spirit of Novgorod, and put down the system of appanages which had been the ruin of the country since the days of Vladimir. Mr. Gossip is at his best when he is giving an account of institutions and reforms. These require to be stated clearly and briefly, and Mr. Gossip states them well. He has succeeded in conveying a just notion of Jaroslaf's laws and of Vladimir Monomachus's advice to his children. He has summed up in a few words the reforms of Alexander II., though it would have been better if the words had been shorter and easier for the "young students," for whom the book is specially written, to understand. In style, however, Mr. Gossip often fails. In his anxiety to be picturesque, he sometimes descends into personal details that could readily be spared in a book which aims at brevity. For instance, in the account (p. 199) of the revolution on the accession of Nicholas, he says:—"The noise of the artillery so frightened his wife, a daughter of the heroic Queen Louise of Prussia" (this is rather a curious antithesis), "that she contracted a nervous twitching of the face which endured through life." Fortunately this sad personal defect was not the only result of the conspiracy. Many of the men who suffered for their part in it were advocates of the new ideas of social regeneration and liberty, and their deaths only caused the opinions they had cherished to strike deeper root into the heart of new Russia.

Mr. Gossip also errs in the elaborately quaint expressions in which he sometimes indulges. He has a special fondness for the word "coy." In p. 35 he enlarges on the "coy denials" of Vladimir Monomachus, when pressed to be ruler over Russia; while he remarks in p. 79 that "the reluctance which Boris showed" (on a similar occasion) "was but a piece of coy dissimulation." This is as affected as it is untrue to fact. Boris's apparent disinclination to succeed his brother-in-law Feodor as Tsar was due to the policy which governed all his conduct. He was far too wise a man, and too cognizant of the temper of the people, to appear to grasp at a throne which should have belonged to the murdered Dmitri. He was well aware of the widespread belief that he himself was the murderer, and that there were also some who did not scruple to impute to him the death of Feodor also. So Boris bided his time, and rejected the prayers of the Patriarch, boyards, and citizens of Moscow, and not until the nation came forward and hailed him Tsar did he consent to wear the crown of Jaroslaf. In the instances we have quoted Mr. Gossip's affectation has given a false impression both of the men and of their time, but sometimes his archaisms are merely meaningless. To say (p. 97) that "when King Sigismund died he (Mikhail) conceited himself that he had found his chance," is bad English, but does not mislead as to facts. To disguise the death of Boris under the elegant phrase that he was "removed" is silly, but it is nothing more; but the remark about Peter II. (p. 140) that he "resiled from the marriage into the promise of which he now conceived himself to have been trepanned" is only to be understood by an ingenious process of guessing.

Mr. Gossip deserves great praise for the careful way in which he has collected his materials, and his statements of facts are, as we have before said, generally to be relied on. Only once or twice has he made a slip, and these slips are comparatively unimportant. In case, however, the book should run into a second edition, it may be as well to point them out, so that they can be corrected. In p. 30, after alluding to the murders committed by Sviatopolk, Vladimir's step-son, Mr. Gossip suddenly takes to calling him "Sviatoslaf," and does so four times in the same page. The confusion likely to arise from this is all the greater as Vladimir had a son Sviatoslaf, prince of the Drevlians, who was himself one of the victims of Sviatopolk. In p. 98 he remarks that "Alexis's minister Morozof induced the young Tsar to wed his wife's sister." Now Alexis was already married to Maria Ilinitchna when Morozof, who was a man of original views, decided that, instead of persistently plotting against the Tsarina, as had formerly been the custom of the Ministers, he would make himself one with the Tsar by becoming his brother-in-law. While speaking of Alexis we may observe that Mr. Gossip has made a most serious omission in his silence about the Patriarch Nicon and his reform of the liturgy. To be sure he gives a short sketch of the matter at the end of the book, but what would English readers think of a sketch of Charles I.'s reign in which there was no mention of Laud? Some reference should certainly be made to the struggle between the old and the new, though it need not be enlarged upon till the author comes to write about the Russian Church. Again, he is in error as to the attitude of the nobles in the question of the freedom of the serfs, raised by Alexander II. It is quite true that they looked on the measure with disfavour, and opposed it as long as they thought that their opposition had weight; but, at last, seeing that the cause of freedom would finally triumph, many of them gave in, and in 1857 the nobles in the provinces of Podolia, Kief, and Volhynia took the initiative, and offered to free the serfs belonging to them. Mr. Gossip is also a little hazy in his dates about the marriage of Catherine and Peter. He says (p. 119), "entering the palace as a mistress, she soon ruled it as a wife." Catherine did not marry Peter till six years after she first went to live with him, and the marriage was not avowed for four years after that, when her high-spirited conduct at the Pruth had gained her the admiration of the army. She was married privately, that is, in 1708, and was acknowledged Tsarina in 1712.

Mr. Gossip has a strange disinclination to mention female names. He reminds one indeed of the primitive men whom custom forbad to speak the name of any woman. In cases where it is more convenient, and certainly more interesting, to form a distinct conception of a lady, in which her name goes for a good deal, we are put off with such descriptions as, his "eldest son married a daughter of the Saxon Harold," "his wife, the sister of Boris," "his morganatic wife, a Polish lady." This is being "*la femme de son mari*" with a vengeance, and it may be questioned if notoriety of this sort would have been acceptable to these ladies. The reader with an inquiring mind is therefore left to hunt wearily till he can ascertain that Harold's daughter, wife of Vladimir Monomachus, was called Gytha, that Feodor's wife was named Irene, and that the morganatic wife of Constantine was Antonia, Princess of Lovicz, for whose sake he resigned the crown of Russia. If Mr. Gossip has reasons of his own for withholding this information, will he not append some tables for the benefit of those readers who find a joy in genealogy?

But all Mr. Gossip's sins and shortcomings are light compared with those in the matter of orthography. We have made a list of errors so long that, if they were all to be noticed, one article would hardly suffice to enumerate them. It is not that he does not spell the Russian names after this or that manner, that he puts two *ff*'s instead of one, or uses an *s* instead of a *c*. Russian orthography is very undecided in these respects, and a good deal of latitude may be allowed. But Mr. Gossip seems to be unacquainted with the rudiments of the Russian language, and consequently often makes nonsense of words which have a distinct meaning. For example, in p. 102, he says the Cossacks of the Dnieper "were joined spontaneously by their brethren the Zaporofskian Cossacks." Now this is nonsense, for the word which he renders Zaporofskian is really Zaporogian, signifying "beyond the *porogs* or cataracts of the Dnieper," where these Cossacks had a wide tract of land. In p. 44 he says the Tatars kept up the distinction of *Veliki Kneis*, or Grand Prince, when the Russian word for prince is spelt *kniaz*; in p. 91 he alludes to the part of Moscow called "*Bely-Gorod*, or the white town," misspelling the first word, which should be "Biel." There are other examples of the same kind, but we have not time to quote them. Many of the commonest names are also printed most carelessly, and without any definite plan. This may be the fault of the printer quite as much as of the author; but, however that may be, no book should be presented to the public in the condition of this one. In p. 40 "Riazan" is spelt "Raizan," in p. 46 Lake "Peipus" is called "Pepius," on p. 48 "Usbeck" is spoken of as "Usback," and in the next page "Bestujef Riumin" is transformed into "Riamin." In the reign of Elizabeth the Chancellor Bestujef Riumin is always alluded to as "Bestuchoff." In p. 61 "voievode" is written "voyrod," and in p. 69 the Tsarevitch is twice called "Tsarovitch." This of course comes from the usual English pronunciation, in which the "o" is made short, and there is therefore hardly any audible distinction between it and a short "e." In p. 93 Pojarsky, the liberator of Russia from the Poles, is spelt "Pojorsky," in p. 102 Dolgorouki is twice called Dalgorouki, and in p. 124 Lewenhaupt, the general, appears as Lewenhauft. Cheremetief is hardly recognizable as "Scherematoff," nor does Catherine II.'s native country fare much better as "Anhalt Zerbert." One regrets that the great Cossack Pougatchef should be introduced to "young students" under the disguise of "Pougateloff," nor is one disposed to abandon the final "p" of "Perekop" in favour of an "f." It is hardly necessary to increase the harshness of the Russian names by inserting more "r's," as Mr. Gossip has done in the case of Souvorof, whom he calls (p. 170) "Surwarroff." "Kinburn" is a very English name, so we must not be surprised if Mr. Gossip has twice written it as "Kilburn." The powerful Zoubof family might commit crimes undetected disguised as "Duboff," but we wonder that the great French financier should rest quietly in his grave and hear himself handed down to posterity as Thurgott. In the account of the conspiracy on the accession of Nicholas one victim is systematically spoken of as "Ryclieff," which after much thought we guessed to be a free translation of "Ryleef." The Polish Marquis Vielepolski has his second "e" changed into an "o"—Mr. Gossip is fond of "o's"—and in the very last page of the book we are overwhelmed with a crushing quotation from a German called "Fuerbach." Considering that people look upon any mistake in spelling their names as the most deadly of all insults, and considering also the present irritable state of mind of the Russians towards the English, it is quite lamentable to think how many additional enemies this short work will gain for us in the descendants of those gentlemen whose names have been so grievously maltreated.

AGUSTIN DE ROJAS.*

AGUSTIN DE ROJAS (or Roxas) was by nature and education a *picaro*. This personage, whom we are very loth to translate

* *El Viage Entretenido de Agustin de Roxas, natural de la villa de Madrid, con una exposicion de los nombres historicos y poeticos que no van declarados.* Quinta edicion, corregida y emendada segun el expurgatorio del año 1747. Con Licencia en Madrid. Por Don Benito Cano, año de 1793.

into "rogue," was the stock hero of the Spanish novels of the seventeenth century, and figured on the contemporary stage as buffoon. Like most of the characters of Spanish light literature, he was conventional, and early became fixed into a type which varied little, if at all, from first to last. The action has always been more interesting to the Spaniard than the actor. It is true that in the course of his career, which lasted some century or so in his native country, the *picaro* became bitter and cynical, rather than merely scampish, as he had been at first, the Inquisition and the Count Duke of Olivares working admirably together to sour men's humour; but at bottom the type varied little. The *picaro* remained very much what he had been on his first appearance, till Holy Church finally banished him, with Jews, heretics, and other unclean persons, into France and England. We know him as Gil Blas, Colonel Jack, Ferdinand Count Fathom, or even as Roderick Random, and are not tired of him yet, though he has ceased to excite any sympathy in his own country; but we regard him, very properly, as an ingenious puppet, invented for dramatic purposes rather than as a portrait of anything in life. He had his original, however. He must necessarily have answered to something in real life, or he would scarcely have met with the immediate and enthusiastic reception that he did. The best definition of him is that he was the Pizarro or Cortes of common life—a pushing fellow, resolved to see the world and make his fortune, and far from scrupulous how he did it; preferring to cheat, though able to fight at a pinch; not incapable, however, of friendship or gratitude, and endowed with a vast faculty for moralizing. When he has conquered his vulgar Mexico, he will build churches and live cleanly, if he does not parody the death of the other conqueror, and die murdered by his accomplices, or sadly serving his Majesty in the capacity of galley slave. In an age in which the pike and the pen were the only tools presented to the Spaniard's choice, the *picaro* had his representatives in letters as well as in arms, and the foremost of these was the author of the *Viage Entretenido*, the Amused and Amusing Journey.

Whether Agustin de Rojas ended his troubled career in the galleys is not known. His last appearance is in the character of lawyer and author of a work on the Good Republic, which the Inquisition put into the Index Expurgatorius, and posterity into the index of the unreadable. Before this fatal fall into dull respectability he had not only sown his wild oats, but written a history of the process. This work, the *Viage Entretenido*, appeared in 1603, and was several times reprinted in the course of the next ninety years. At the time of its publication, and apparently for some years before, the author was following the profession of actor, which in Spain in those days included that of playwright. Although he was barely six-and-twenty, he had already a vast vagabond experience. In his preface he asks whether even Guzman de Alfarache, who had issued from the press, some four years before, or Lazarillo de Tormes, the founder of the great *picaro* line, had had more masters or been in more scrapes than he. In unconsciously biblical language he declared that he had been more rolled about in the world than a wheel—the wheel he names being the familiar "azuda" or Moorish water-wheel of Toledo, elsewhere in Spain called a "noria." And if we are to trust his facts, the comparison is just. Though a gentleman by birth, an hidalgo free from stain of Jewish or Moorish blood, he was born in a condition which he has chosen to leave in obscurity. Like Lope de Vega or Sta Teresa, he was early urged by his roaming instincts to leave the quiet of home; but there were no officious relations to cross his wishes, and he began life as page to some other penniless hidalgo then trailing a pike in Flanders. The heroic days of the Low Country wars were over before Rojas came to serve in them. There was still fierce fighting to be done and plunder to be got, but they bore no proportion to the starving and shivering to be gone through. The pay was for ever in arrear, the commissariat was stupendously bad, the country produced no wine—frequently indeed there was nothing better to drink than the more liquid kinds of mud. By the age of seventeen the future actor had seen enough of war. He found his way back to Spain in the suite of some general officer, and betook himself to the kind of life which Spaniards call "living by miracle." The details of this life he gives in the most general possible manner, but he seems to have starved, robbed, begged, and been happy. Finally he drifted on to the stage, which had now become the El Dorado of young Spain. What time he can have found to learn anything but the ways of the world in the course of these few and busy years it is hard to see; but he had certainly picked up a good deal of the classical commonplace then fashionable in literature, some Latin, a great amount of undigested general information, and a remarkably terse and lively Castilian style. His Journey is full of "loas"—that is, long prologues written by himself to flatter the audience and put them in a good humour for the comedy. These prologues were to the old Spanish stage what the introductory farce is to ours, and Rojas's productions are perhaps the best specimens of their kind.

But if the *Viage Entretenido* contained nothing beyond the personal adventures of Agustin de Rojas, it might be left to sleep in peace with Marcos de Obragon or the Pícara Justina. It would certainly not be cited as an authority by every writer on the Spanish stage. Fortunately the inquiring spirit of the writer led him to collect all the information he could about his own profession, and the growing interest of the public in matters theatrical encouraged him to pour it all out in his book. The forms in which he has given it are singularly happy. Putting aside a certain amount of padding, consisting of episodes after the manner of the old gentleman Tom Jones met in the wood, and lumps of undigested guide-book about the various towns named in the course of the journey, which make excellent skip, the *Viage* may be divided into two equally interesting parts. In the first place there is the framework—the "amusing" conversations of the four actors, who are, so to speak, the heroes. Then there are the *loas*. The conversations are carried on by four persons; Rojas himself, and his friends Rios, Solano, and Ramirez, all known names of actors of that time, according to Nicholas Antonio. The great subject of their talk when they are not patiently undergoing instruction in history and geography from Rojas is naturally their own profession. The discussions are held as they are on the tramp from town to town in advance of the rest of the company; and the writer shows considerable skill in introducing his subjects appositely. The repetition, too, of the *loas* is generally suggested by some observation of one of the four interlocutors. A complaint of the lawless habits of the people of Seville, made by one of the four, reminds Rojas of a *loa* which he wrote to induce the playgoers of that city to pay at the door. This, it seems, the more high-spirited of them had been wont to consider a slavish submission, and they had accordingly preferred to force admittance, a custom which led to brawling and stabbing, for which the authorities held the players responsible.

The picture which *loas* and talk alike give of the actor's life is certainly not without its lights. We find occasional mention of their popularity with all classes of the Spanish people, made in a way that bears out the truth of Sancho Panza's statements when he was persuading his master not to rush into a conflict with the strolling players of the *auto sacramental*. They were very generally helped when ill luck or their own folly reduced them to begging on the tramp. When Rojas himself was attacked, stabbed, and left for dead in the streets of Seville by some fellow-actors to whom he had refused to give money out of the company's cash-box, he was an object of general sympathy to the whole city. When he recovered, the theatre was crowded with admirers who loudly applauded the *loa* in which he gave a history of his misfortune. But the chief pleasure of their life was derived from their own innate love of freedom and vagabondizing. Rios narrates with relish how he and Solano some years before, in consequence of certain previous adventures not detailed, had been compelled to shift for themselves on a sudden emergency; how at one village they had got good quarters by representing themselves as merchants, had collected entrance-money for a piece they were to give, and had then escaped, leaving an unsettled bill and an unsatisfied audience; and how at another place, having promised to perform the *auto* of Cain and Abel for food and lodging, Solano appeared, with a candle in his hand, as Dios Padre, in a sheet of the landlady's, stained with wine lees. This performance ended unfortunately. Rios, having to kill Solano, who doubled the parts of Abel and the Father, forgot his knife, and, trusting too much to the patience of a rustic audience, took off his beard for the purpose. Hereupon the "banks of galley slaves," as he styles the audience, rose in indignation, and the actors had to fly to escape a cudgelling. After much further wandering, and not a little starvation, they fell in with the strolling company of Martinazos, from whom they obtained food and work. This enterprising manager took advantage of their unlucky position to make them carry his wife in a queen's cradle when the fatigues of the road were too much for her, whereby he economized the hire of a mule.

Rios and Solano, who seem to have been the experienced veterans of the party, impart instruction as well as inspiriting tales of adventure to their younger friends. Solano, having had occasion to observe that he had been less even than *farándulero*, for he had been *bojiganga*, is called upon to explain. He then proceeds to set forth, in a speech which contains more information as to the inner life of the old Spanish stage than can anywhere else be found, that there are eight distinct forms of company, each having its recognized position in the theatrical world—namely, the *bululu*, *ñaque*, *gangarilla*, *cambaleo*, *garnacha*, *bojiganga*, *farándula*, and *compañia*. The description of these different societies is somewhat too wordy, and the distinctions are over-refined, but, on the whole, we find the names answering to really different forms of company. The *bululu* is a single stroller who has to fall back on the sacristan to help him through the little religious plays which were the greater part of his repertory. The *ñaque* is formed by two men strolling as Rios and Solano had done, from which it appears that the latter had been less even than *bojiganga*. It would be tedious to go through the other companies in detail, more particularly as the distinctions between them are often without a difference, and so we pass at once to the *cambaleo*. This company is marked off clearly from the lower ranks by the fact that one of its members is a woman. From the *cambaleo* we rise through the other companies, which rank according to the number of persons they contain and the proportion of women and boys taking women's parts, till we arrive at the full *compañia*, which is at the top of the tree. This, says Solano, must consist of sixteen persons who act, thirty who feed at the general expense, one who takes the money. "God only," adds the speaker, "knows how much he steals." These distinctions no longer exist in the Spanish theatrical world; they were obviously dying out when Rojas published the *Viage*, but some of the words are even now in use. An inferior actor is still, for instance, called a *farándulero*.

The adventures are narrated and the information given to a

running chorus of grumble. Nicholas Antonio, in the twenty lines or so of his Latin devoted to Rojas, says that "laboriosissimæ istius vitæ (the actor's to wit) conditionem domesticus testis in publicum produxit," and the continual complaints of the hardships they underwent made by all four speakers in the *Viage* bear him out. Not only is repeated mention made in the conversations of their hard work and hard fare, but in one of his *loas* Agustin himself declares that the life of a slave in Algiers was more supportable. The actor has to be up before the dawn writing and studying. All the morning he is rehearsing, all the afternoon performing; at night, when even the slave may rest, the less lucky actor may be summoned by some man in authority who must not be refused to come and amuse his guests. This last abuse rose to such a height that it had to be finally, not abolished, but limited by law. In another *loa*, the manager of a company, threatened with loss of custom by the sudden appearance of a rival troop, reminds the people that he had presented them with fifty-four new comedies and forty farces in the space of eighteen months. As these pieces were not only rehearsed and acted but written by the actors—whence Rojas's complaint about the studying and writing, and the manager's title of "author"—we can quite understand why Antonio describes their life as very laborious. Yet the attractions of its freedom and constant change proved strong enough to keep it filled with the most spirited youth of Spain during the latter half of the sixteenth and the whole of the seventeenth century. Of this popularity Agustin de Rojas was at once a proof and a cause.

CALENDAR OF STATE PAPERS.*

AMONGST divers excellent rules laid down by the Master of the Rolls for those who undertake to edit State papers is one to the effect that in no case is the Preface, in explanation of the documents calendared, to exceed fifty pages without a written permission. We are glad that in this case the permission has been given. No one, not even a reviewer, can be expected to read every word in a volume of more than six hundred pages, which aims at giving an abstract of more than nineteen hundred State Papers, relating to such vast topics as our American colonies in the reign of Charles II., our colonial possessions in the same hemisphere as distinct from colonies, our West Indian colonies, and our possessions in Africa on the Gold Coast, in the West Indies, and elsewhere. A preface of eighty or more pages is indispensable to convey some outline of the numerous Orders in Council, formal proclamations, reports of Governors, petitions of oppressed individuals, and disputes with the French, Dutch, Spanish, and other nations. The directions of the Master of the Rolls for the treatment of every document strike us as judicious, and they have been faithfully observed. A mere abstract like the ordinary heading of a chapter, would have been tantalizing, deficient, and obscure. To reprint every paper *in extenso* would have been impossible. Accordingly, a middle course has been taken. Formal documents are cut down to a couple of lines. Letters relating to a single subject are catalogued, or rather are abstracted "as briefly as is consistent with correctness." But where they relate to a variety of subjects they have been so analysed that the student may carry away a correct notion of all the contents. Endorsements and dates and the number of the pages are recorded and striking expressions or proverbs are reproduced. And it will be at once admitted that such entries as a warrant to pay Edward Morgan 3,000*l.* to be employed for his Majesty's use in Jamaica, or a pass for Mr. Reid to transport a hundred horses to Barbadoes, are in themselves adequate and complete. But reports on the climate and soil of Jamaica, Acadia, and Barbadoes, as well as of the desperate valour shown by soldiers and colonists against the French and Dutch, or of devastating hurricanes and like calamities, demand a much larger space. And it may be fairly said that any one accustomed to deal with official documents will tell at a glance—to use the expression of the Master of the Rolls—not only what is contained, but what is not contained in the originals. A compiler or historian will know exactly what he may expect to find. He will not be sent wandering on fruitless voyages of discovery, and he will only go to the State Paper Office when it is incumbent on him to take nothing at second-hand. The index is methodical and copious, and far the greater portion refers to proper names, though after Jamaica, Boston, St. Christopher, and King Charles—to all of which whole columns are allotted—we have a little space given to such miscellaneous matters as venison, vegetables, bread, and fish.

Such compilations can be opened at any page of the six hundred with both profit and pleasure. Light will be thrown on the legislation, the social habits, the thoughts and expressions, and the spirit of enterprise and adventure that distinguished men of the seventeenth century. Society had just begun to recover from the convulsion of the great Civil War; and whatever may be thought of the manners and morals of the Restoration, this volume affords a convincing proof of the earnest attention which was given by the Councillors of Charles II. to Plantations and to Charters, to law and justice, to the management of the trade in silk, to the expansion of commerce, and even to the spread of Christianity. The monarch might be feeding his ducks, or toying with Lady Castlemaine and Madam Carwell; but such energetic men as the two Lords Willoughby were in succession governing Barbadoes; John Locke, as secretary to Lord Shaftesbury, was endorsing, annotating, and framing State Papers; and Robert Boyle, with some of the worthiest names in England to back him, was the first Governor of the Company for the Propagation of the Gospel in New England and the parts adjacent.

It is no easy task to convey in two or three columns a correct idea of old papers fully as interesting as the report of a modern Consul in Eastern Roumelia, or a despatch from a mission which had just succeeded in reaching Khoten and Yarkand. But we should be inclined generally to describe this bulky volume as follows. There are, first, Orders in Council sending out Governors, prescribing the course of legislation, defining the extent of executive authority, and giving directions for the redress of grievances. Then come the reports of Governors dilating on the beauty of the climate, on the abundance of provisions, fish, minerals, and other products, on the bad behaviour of evil-disposed persons, and on the insolent aggressions of the French. We have next petitions from individuals who crave pensions, complain of losses, suggest new and untried fields of enterprise, and indulge in speculations of boundless wealth. There are, besides, papers relating to the scale of salaries and allowances, perquisites, punishments, kidnapping, and other incidents certain to distinguish an age no less conspicuous for bravery and daring than for acts of favouritism, corruption, and downright rascality.

The Quaker, in this volume, seems to have fared no better at the hands of Royalists than, according to Macaulay, he fared at the hands of the Puritans. He had by the latter been "persecuted to the death in New England," and, after the Restoration, he was regarded "as the most despicable of fanatics." He objected to take the oath of supremacy, because his "conscience would not suffer him to swear to any proposition whatever." The consequence was that members of this sect were treated quite differently from ordinary Nonconformists. At Boston, eight-and-twenty Quakers were whipped cruelly "only for coming into that Government." Under another law, of the same town, three persons had their ears cut, and one woman, aged about sixty years, was also whipped. Under two other laws several more were imprisoned, fined, banished, and even put to death. No wonder that they appealed to England, and that the King directed that such persons should be sent home to be dealt with agreeably to their demerits and to "our laws." Once, a master of a ship was bold enough to certify that he had put ashore certain Quakers who had been sentenced to banishment in Barbadoes and Jamaica, "by reason of disasters that had befallen him since they came on board," and because he judged it contrary to the laws of England to transport men without their consent. But others of this sect were ordered to be transported to Jamaica by a warrant to the Lord Chief Justice, "on account of their more than ordinary insolence." Yet, on arrival at that colony they could only expect, as we read in the very next document, to be punished for not appearing in arms on muster days, and for refusing to take oaths or to serve as jurors; while they were also bound to contribute to all taxes, including those for churches and their incumbents. In a report from Governor Endicott, who approaches the King as "your poore Mephibosheth," these unfortunate sectaries are described as open blasphemers, open enemies to Government, and promoters of doctrines tending to subvert Church and State. On the other hand, we find that in New Hampshire, a certain Major Shadleigh was left to settle an unjust matter over which other Commissioners had "sat to no purpose." The writer of this document was of opinion that, though a Quaker and neither taking nor imposing oaths, Shadleigh was unfit for a Governor but quite fit for the employment he had in hand. The whole paragraph, with the acquisition of the title of major, is somewhat mysterious, though paralleled a little further on by Lord Willoughby's allusion to one Colonel Lewis Morris, a severe Quaker, who would astonish a Frenchman by his "thee and thou." The same Colonel is elsewhere described as an unfit man to negotiate with "so airy a people" as the Monsieurs, who would take his presence as no small affront. In Barbadoes the Governor, Sir Thomas Modyford, had thought it desirable to employ on some confidential mission to San Domingo a certain John Perrott, a noted Quaker, of good temper, skill, and knowledge in merchant affairs, whose great cunning, searching, and industrious spirit and loyalty to the King must beget confidence. This worthy gentleman was quite content, for his Majesty's service, to appear in a black satin suit with sword and belt, and to be called captain. This partly explains the titles of major and colonel in two preceding extracts, and is a slight set off against the whippings and imprisonments inflicted on a sect that hated episcopacy, and entertained singular views about diversions, forms of speech, dislike of oaths, postures, and dress.

Several of the extracts have reference to ebullitions of political feeling, and especially to the pursuit of two of the regicides, Whalley and Goffe, who figure in New England as Richardson and Stephenson. These two Hectors, as they are termed, were in 1661 daily "buzzing in the ears of the people about a change of Government." They had got the Marshal-General on their side, and though repeated orders were issued for their capture they always managed to elude pursuit. In vain did Governor Endi-

* *Calendar of State Papers: Colonial Series.—America and West Indies.* 1661–1668. Edited by W. Noel Sainsbury, of the Public Record Office. London: Longmans & Co.; Trübner & Co. Oxford: Parker & Co. Cambridge: Macmillan & Co. Edinburgh: A. C. Black and Douglas & Foulis. Dublin: A. Thom. 1880.

cott issue instructions to the Governor of Connecticut, to the Deputy Governor of New Haven, to the Governor of Plymouth, to Peter Stuyvesant, Governor of the New Netherlands, and to divers other functionaries to have these rebels apprehended. In vain did one Dennis Scranton give information that they were hidden in the house of one Davenport, a minister in New Haven; that one Goodman Bishop of the town of Guildford, was able to give the like account; and that Deputy Leete knew quite as much. One John Crown—the name is curious in the pursuit of two regicides—had the audacity to depose that Governor Endicott himself had bade them heartily welcome to New England, and had expressed a wish that more such good men would come over. The two fugitives were even said to have been visited by the principal persons of the town, to have been held in great esteem for their piety and parts, and to have so preached and prayed as to be looked on as men come down from heaven. Of course the Governor denied these allegations as calumnies and trusted to have an opportunity of vindicating himself. Afterwards we are told that Whalley and Goffe were entertained and feasted in every place, though known to be traitors. Indeed, a strong feeling in favour of the Commonwealth seems to have animated these colonists, and to have been proof against every threat that councils and authorities could devise. Except that some cattle were subsequently taken and found to belong to these "arch traitors," we have no final report of the fate of Whalley and Goffe.

The questions of colonizing the Plantations and of kidnapping men to go there are so closely connected that we must treat them as one and the same. Constant petitions were presented to the King and Council on behalf of merchants and planters, who stated that young people were entrapped and spirited away. Lady Yarborough especially, complained that a poor boy had been stolen by spirits as they were termed, and she begged that outgoing ships might be searched. But there was a contrary account which said that evil-minded persons, taking advantage of this popular belief, enlisted voluntarily, received advances of clothes and money, and then pretended they had been carried away against their will. The remedy proposed was a registry of all passengers, and it was also urged that vagrants, rogues, felons not entitled to benefit of clergy, gipsies, and such like, should be transported to the Plantations to serve, according to their ages, for four or seven years. But this plan evidently did not answer, for we have other reports and memorials praying that well-disposed persons should be sent out, not as servants for a term, but on meat, drink, and wages. The example of the ancient Romans is quoted, for they despatched real colonists and "not your convict gaol birds or riotous persons, robbers before they are sent forth, and at best, idle, and only fit for the mines." In one aspect "Free-trade" is extravagantly lauded as the life of all colonies, but this advanced doctrine is mysteriously coupled with a wish to go to Guinea for negroes, who fetched at that time from 17*l.* to 19*l.* apiece. The pros and cons of colonization are set out with much exuberance of diction and in the style peculiar to men who were not unaware of grave physical obstacles to success. Newfoundland agreed with all God's creatures, except Jesuits and schismatics; it was the greatest nursery for seamen; and, when trade flourished, could bring in to the nation half a million a year. The inhabitants, however, sadly lacked a minister to christen, bury, and marry them, and they were living like so many brutes. Jamaica had the best building timber and stone in the whole world, and plenty of corn, potatoes, yams, plantains, hogs, fowls, cattle, horses, sheep, fish, turtle, and pasturage. The low grounds were feverish from June to Christmas, but the uplands and hills were as "healthful as Cotsall in England." This attractive Settlement, we regret to say, had for the Speaker of its Assembly a malicious, beggarly, debauched fellow, who, instead of correcting what was amiss in the old laws, attempted by violent discourses and contrivances to render the past Government oppressive and illegal. Barbadoes had been settled in 1625, and in ten years was brought to such perfection that it exported as many tons of goods as the famous Empires of Mexico and Peru. But it fell off afterwards. Boston was a place of incredible fruitfulness in mines, especially copper, and in fish, and could turn out better salt than France itself. Montserrat was very fertile and well re-settled; Nevis decayed, owing to the wars and hurricanes; St. Vincent, covered with wood and inhabited by Indians and Blacks; St. Lucien, unhealthy, the English who had planted it having nearly all died. We note in our days of rapid intercourse that on one occasion the *Rosebush*, a ship commanded by worthy John Browne, left Jamaica on the 10th of February and arrived in the Downs on the 12th of April following.

Several of the documents are entirely taken up with disputes as to boundaries and possession with the French and other nations, and the editor admits that the geography is intricate and confused. The accounts of fighting at Nevis are both animated and instructive. But we own to a partiality for trivial and petty incidents, for queer grievances, and for strange proposals emanating from individuals. Four thousand pounds of such worthless bread were sent over to Jamaica that in consequence it had to be given to cattle or thrown away. Anthony Langston, formerly an ensign in Prince Maurice's regiment, and afterwards fourteen years in Virginia, mysteriously informs Secretary Bennet that he was drinking at the "Dog" tavern, when a person came and invited him to engage in some design. One Waddington, in like manner, drinking at St. Michel's, Barbadoes, uttered treason in his cups, and was actually sentenced to death. As the petitioner expressed due contrition and his prayer was referred to Sir H. Bennet in England, we may hope that the capital sentence was remitted. Colonel Morgan complained that in a tedious passage to Barbadoes he had lost his eldest daughter, a lady of great beauty and virtues, and two more of his family, owing to a malign distemper, caused by the "nastiness of the passengers." A harsh law of Barbadoes condemned a fraudulent debtor to stand in the pillory and have his ears cut off. Sir T. Modyford, Governor of Jamaica, wrote home that old army officers, we presume men of the Commonwealth, from "strict saints had turned the most debauched devils." Four young men were scourged by the hangman through Edinburgh, burnt in the ear, and then sent to Barbadoes, for abusing James Scott, the minister of Ancrum, during the time of the sermon. Whether the insult was because the offenders revolted against unsound doctrine or the unreasonable length of the discourse does not appear. In a treaty made by Lord Willoughby with several of the "captains" of St. Vincent, whom we take to be the heads of Indian tribes, the following names occur, and they would have perplexed the late Fenimore Cooper. What would that author have made of Nicholas, Aloons, Rebura, Le Suroe, Nay, Wappiya, and the Grand Brabba? These savages appear to have caused less trouble about a treaty than the French at St. Kitts, who played fast and loose on their paroles and were full of quillets. We have no more space for these curiosities of official literature. This bulky instalment is hardly capable of much improvement; and, if it does not enable historians to indulge in the modern practice of alternately whitewashing and blackening eminent characters in history, it sheds a strong light on those national qualities of energy, perseverance, and fitness for supremacy which yielded up our American colonies only to our own flesh and blood, and which as a compensation for that loss gave us dominion over aliens in creed and colour in India.

TROUBLESOME DAUGHTERS.*

MRS. WALFORD, like many another novelist, has suffered from her very success. She began by writing a story that was as clever as it was short. Having made a hit, she was at once promoted to the ranks of those who, whenever they have a tale to tell, always take exactly three volumes in which to tell it. It is a dreary superstition, whether it is on the part of the reading public, or of the proprietors of circulating libraries, or of the publishers, which thus condemns a writer, because she has been clever and brief, to run a great risk of being long and tedious. We heartily wish that some Chancellor of the Exchequer might be found bold enough to put a heavy tax on the third volume of every novel and on the fifth act of every play. We are quite sure that, in the long run, it would be found to benefit authors, libraries, publishers, spectators, and readers alike. The relief to the unhappy critic would be almost beyond measure great if each story could thus be kept within moderate size. No one, we may take it for granted, really likes to be wearied. No one would rather skim three volumes than read steadily through one. It is indeed provoking to see how a writer of Mrs. Walford's cleverness injures her story from the necessity of swelling it out to orthodox proportions. Why could she not have been allowed to make *Troublesome Daughters* just one-third of its size? We are sure that, had she consulted her own inclinations, she would have set before her readers a much smaller and more homely banquet. She could with admirable skill have served up to them a nice little meal, but she is compelled by fashion or destiny to provide them with a monstrous bill of fare. There is in the story before us so much that is good that we are greatly vexed to find it hopelessly mixed up with so much that is bad. The heroine is as charming a young lady as we have come across for many a long day, and the hero is not unworthy of her. Was it likely, we ask Mrs. Walford, that two young people such as these would, as the result of a single misunderstanding, have been kept apart for more than five whole years? We will not be unreasonable. A love-story cannot of course run on quite smoothly. Things must be made for the first half of the book to go a little wrong, in order that the author may be able to fill up the second half by making them go altogether right. We would willingly allow Mrs. Walford, like Penelope, to weave a web solely with the intention of unravelling it. But there must be some limit to this. We have not in these modern days the patience of the suitors of old, and we expect that what used to take ten years shall now be done in one season. We have little doubt that once at least in the present story, if not twice, it was a sore trial to our author not to clear away all the difficulties, and to bring her story to the usual happy end. Even in the state of affairs at the close of the first volume a dozen pages or so would have been quite enough to enable an experienced writer to remove the misunderstanding and to reconcile the lovers. Who does not remember the delightful promptitude with which in the good old times, all on one day, news came of the death of a rich uncle or godfather, the hard heart of a father was softened, a hero became penitent, and a heroine forgiving, while a parson was found in the very nick of time? Captain Evelyn, our hero, had no doubt given our heroine, Miss Kate Newbattle, just cause of offence. He had shown that his standard of integrity was far below hers. But she need not, therefore, have at once burst a blood-vessel, in a lonely cave on a

* *Troublesome Daughters.* By L. B. Walford, Author of "Mr. Smith: a Part of His Life," "Pauline," "Cousins," &c. 3 vols. Edinburgh and London: Blackwood & Sons. 1880.

wild sea-coast, with no house near at hand, and with the doctor a very long way off. She might have fainted. He would have run down to the shore and brought up a hat-full of water to dash on her face. She would have recovered consciousness, and in a faint voice have granted him that forgiveness which his contrition proved that he really deserved. We can well believe that Mrs. Walford would have liked only too well to give the story this happy and quick conclusion, had she not been troubled with that cry, hateful to all writers, of "more copy wanted."

We will forgive her, then, for thus letting slip her first chance of delivering both herself and her readers; but why did she allow herself to be talked over into not taking advantage of her next chance? Matters could not possibly have been in a fairer train than they were at the close of the second volume for bringing everything to the happiest conclusion. The heroine had not only recovered from her illness, but did not apparently show any weakness of the lungs. It was clear that she was not intended to go off in a decline, after the fashion of one large class of novels. The hero had been separated from her long enough to punish him for the error into which he had fallen. Matters were so arranged that his return to her home would have afforded a most dramatic scene. He had even fixed the very day on which he was to start, and she was awaiting him with the most forgiving of hearts. The reader, who knows that he has yet another whole volume before him, cannot imagine how the young people are any longer to be kept apart. In fact, he is almost convinced that the last part of the story must be given up to the narrative of their wedded life. When things are in this happy train, the hero gives credence to a miserable piece of slander against the heroine, and starts at once for the seat of some war in the East. For all that the reader can see, he might just as well at the end of the five years have started off to the seat of some other war in the West. We could more easily have forgiven Mrs. Walford for this most needless expansion of her story had she provided us with good company during the hero's absence. Many of her minor characters, however, are as vulgar as they are dull. We wish our female novelists would go to Miss Austen to learn how a lady, when she writes, should deal with vulgar characters. No one could be more utterly vulgar than John Thorpe in *Northanger Abbey*, and yet the description of him is altogether free from vulgarity. He is as mean a man as Mr. Pollaxfen of the story before us. His sister, Isabella, is as mean as Kate Newbattle's sisters, or as Captain Evelyn's mother; but the reader is never overwhelmed with a sense of their meanness. It is kept within due limits, and it is never for one moment used to swell out a volume. Not the least disagreeable character in *Troublesome Daughters* is a French governess; nor are the passages in which she is introduced at all relieved by her broken English or her bad French. Her accent, we are told, was Parisian; but her French, we boldly maintain, would disgrace even her Scotch pupils. It is not only that her accentuation is imperfect. It is not only that she says *assurement;* but she disregards her genders. One young lady she describes as being *une vrai Parisienne*, and another as being *décolleté*. She announces that she herself will be *prudent*, and she says that some one will "go chez Londres toute de suite." The author herself catches this Parisian lady's bad French, for she speaks of one of the characters as being "ami du famille." It is a pleasant contrast to such foolish writing as this when we are taken, as happily we are not unfrequently taken, among the peasantry of Galloway. Mrs. Walford is at her best when she is describing homely people—above all homely Scotch people. There is one great charm in the Scotch stories. The language that the people talk would seem to be still pure and undefiled. It has not yet fallen to the depths of that mongrel tongue in which many of our common people, and most of our novelists, delight. It can, we fear, hardly be the case that the peasantry in Scotland are free from the desire of using big words which are beyond their understanding. There are as yet, however, few signs of such words, if we may trust the stories in which their talk is introduced. None of the Scotch characters in Mrs. Walford's tales speak after the fashion in which we heard a driver of a country fly speak the other day. "I always," he said, "say the same argument, and I always shall say it. It is the farmers as needs to be rectified, and not the landlords." The poor man had this excuse, that for many years he had been, as he told us, a gentleman's servant. Likely enough he had picked up his big words from his master. It is not only, however, the contrast between the talk of the lower classes in the two countries that pleases us. We find a still greater and more pleasant contrast between Mrs. Walford's style as a writer and her style, so to say, as a speaker. Compared with many of her fellow-novelists, indeed, she stands well in point of composition; but yet we will venture to assert that she really writes better English when she is writing Scotch. Her humour, too, of which she has a fair share, has freer play in the dialect of Galloway than in the talk of society; while one or two of her pathetic touches are greatly heightened by the simplicity of the language in which they are given. An old Scotch farmer is drawn with great skill. The heroine at one time sought refuge in his house when her life at home had become more than she could bear. The farmer's daughter was a young lady of some learning, and the two girls in the evening would gaze on the stars through a telescope, and talk about the wonders of the heavens "till the farmer would aver that 'it bept a'' to hear them":—

> He would listen, at times, with his mouth wide open, and a lurking smile about the corners, betokening incredulity and amusement, not unmingled with derision,—but he never interfered. If bidden himself to come and have a peep, he dutifully obeyed, resting his hands on his knees, screwing up one eye, and feeling involuntarily for the trigger, as the attitude reminded him of fingering his ancient firelock; but he never could see what he was told he ought to see.

They tried to make him understand the relative sizes of Jupiter and our earth—"they always now talked of 'our Earth,' and wrote it with a large E." But the old man used to say, "it's beyont me. Na, na; I'm ower auld; I canna come Jupiter." They would try him again and again after that, but he had only one answer, "I'm ower auld; I canna come Jupiter." We are reminded of a story that we have heard of an old manufacturer who was present one day when his daughter was receiving a lesson in astronomy from a country schoolmaster. The old father rose up and said, "Why, schoolmaster, you don't mean to tell me that the earth turns round before the sun like a guse (goose) before the fire." Mrs. Comline, the farmer's wife, is even better drawn than her husband, and gives a great charm to the opening chapters, in which she plays a considerable part. She appears from time to time upon the scene, and is always welcomed by the reader, much as he would welcome the fresh breeze, should he on a summer evening pass out of the heated air of a crowded party. The heroine, too, we must not forget, is always charming. There is indeed much that is both wholesome and pleasant in *Troublesome Daughters;* but we must once more express our regret that it has been so greatly spoilt by being mixed with what is as vulgar as it is laboured and dull.

CLASSICAL SCHOOL BOOKS.*

OUT of an inviting batch of school classics we take first Mr. Skrine's Second Georgic, and here we realize how much Mr. Skrine has contrived to say about his author without long and stiff explanations, or elaborate parallelisms between Virgil and Lucretius. In his introduction he facilitates the young student's power of comprehension of a poet's design to treat, in heroics or blank verse, his fourfold theme of tillage, trees, cattle, and bees; he shows how Columella endorsed Virgil's form of treatment by his poetical book "on gardening" as a supplement; and elucidates the practical wisdom of Mæcenas's suggestion of the Georgics to the poet. Mr. Skrine has recalled us, briefly it is true, but perhaps more lovingly than most recent editors of the Georgics, to their author's art; and he has been very happy in noting both prefatorily and in his brief commentary the proofs of Virgil's hearty love of his subject:—

> In return [writes the editor] his *protégées* take him into confidence, and he learns how they think and feel; he sees the docile growths of the woodland exerting themselves to learn the lessons of civilization; he notes the wild tree that has received a fruitful graft wondering at the delightful transformation and preening herself in her new leafage and unfamiliar fruit; he has sympathy with the corn crops "taking heart" after a burst of rain, and even listens to the miserable boast of the chalk and tufa stone that no lands can match them in feeding and housing snakes.

A propos of this last allusion, indeed, it should be remembered that an observant scholar and naturalist, Mr. Blackmore, the author of *Lorna Doone*, dissents from Conington and authorities as far back and weighty as Servius, and will not be persuaded that "tophus" and "creta" can be nominatives to "negant." But one or two other examples cited in the foregoing quotation are no matter of doubt; as where the poet exalts the marvels of grafting and transplanting:—

> Tamen hæc quoque si quis
> Inserat aut scrobibus mandet mutata subactis
> Exuerint silvestrem animum, cultuque frequenti
> In quascunque voces artes haud tarda sequentur.—49–52.

And the scholar notes that, after once the wild spirit is put off, the trees will learn any lessons to which you invite them *as if they were alive and could hear you.* Similarly in v. 59, a little below at "Pomaque degenerant *sucos oblita priores*" is noted "a personifying touch," as Mr. Skrine remarks. "The Tree forgets its cunning as a craftsman might forget the trade secret of his family." There is a happy power of putting things about this editor, as seen in his note (66) on "Herculeaque arbos umbrosa coronæ," where, after stating the legend or myth about Pluto and Leucè, and Hercules's connexion with it, he points out that the tree is spoken of as if it belonged to the wreath, because the wreath "is the *raison d'être* of the tree, as we might say the yew was the tree of Robin Hood's long-bow." We counsel young readers to lay this book to heart, and read it lovingly in the coming tree-time. So will they realize better such touches of Virgil as the enumeration of the trees of spontaneous growth, which "campos et flumina late *Curva* tenent," "an artistic touch," says our annotator, "picturing a plain through which the river winds, traceable by the line of willows." See Blackmore's version, "Peopling the rivers and the mazy brook."

Mr. King has made, in his *Select Orations of Cicero*, a faultless selection of Cicero's most famous speeches; and we cannot be wrong

in touching chiefly on his handling of the First Action against Gaius Verres, because it exhibits Cicero in the character of a public prosecutor, whereas that on the "Imperium Cnæi Pompeii" introduces us to a rather literary than legal speech in the region of politics, and the Pro-Archia is most attractive as a panegyric. The Ninth Philippic will repay the studious reader, and may well be studied in so clear a text, and with such succinct, helpful notes. Our own remarks will be confined to the strong arguments of one who, from his position as Curule Ædile, felt bound to give the people of Rome a different sort of show from that which it was the Ædile's function to give them, the exposure of flagrant and flagitious bribery conducted on a large scale, and by an abandoned and wealth-brazened criminal. It will be well for the reader to have recourse to Long's Verrine volume in the *Bibliotheca Classica*, which often sets sound counsel before us as to doubtful readings, and almost always gives the clearest accounts of legal words and terms. How Cicero thwarted the plots of this provincial "depeculator ærarii" and "prædo juris urbani" becomes amply plain as the oration nears its close, and it will strike the reader that never did orator hit on a happier occasion for stirring onslaught on wholesale corruption, than when all Italy was met at Rome for the triple object "comitiorum, ludorum, censendique," *i.e.* the registration. How well in c. 8 does he twit the "divisores," or bribe-distributors told off to distribute bribes in the several tribes, and mock the defendant as coming from "a first-rate school of distributors" (*disciplinâ*, denoting ironically the scope of the Verrine philosophy). In the tenth chapter and elsewhere *Junianum consilium* is described as a byword for a corrupt jury, taken from one presided over by C. Junius as Prætor in B.C. 74, which, at the trial of Oppianicus for attempting to poison Cluentius, acquitted the offenders by such open bribery that the phrase passed into a proverb. To so great a precision had the science of bribery progressed that in the thirteenth chapter "discoloribus signis" denotes "ceræ" of different colours, so that each man's vote might be traced home to him, and it might be seen that he had earned his bribe. In c. 14 we prefer Long's reading, "se avarissimi hominis cupiditati satisfacere posse, nocentissimæ victoriæ non posse," to Klotz and King's *nocentissumi*. This latter, as Long notes, is but a specious correction, simply needless. In the beginning of c. 15, "Cui loco" would appear to mean "For which topic." But, on the whole, the care evinced on this oration should be a guarantee and encouraging for going through the rest.

Dr. Schmitz's *Elementary Latin Grammar* deserves a longer word than we can spare of it, in such a grouping of school-books, for its excellent chapters on the irregularities of verbs, and the thoughtful and ingenious notes on such compounds of "eo" as "veneo" and "ambio." We can speak well, too, within its range and scope, of the appended syntax, *e.g.* § 137; the arrangement, for instance, of the syntax of the dative; and what the editor calls the free use of the genitive—*e.g.* "sceleris purus, solutus operum, &c." It is evident that in all these instances the Doctor's dicta are the result of philosophic inquiry out of proportion to the small work to which he has devoted his leisure.

Mr. Jerram's capital edition of the *Tablet of Cebes*, Lucian's *Vera Historia*, and the like, would be warranty for his thorough editing of so typical a play of Euripides as the *Alcestis*; and accordingly we find that he has neglected no point either of meet and full prefatory explanation, or of interpretative and searching commentary. Disinclined to accept the play as a purely satiric drama, he adduces proofs of its being at least a pro-satiric play, and wins our credence for the pitting of Death against Apollo as a fair dramatic resort by adducing dramatic impersonations of Kratos and Bia in Æschylus, and Death and the Fool in old English morality plays. Again, his ethical analysis of the character of Alcestis is excellent, and a just and reasonable clue in pp. xiii.-xiv. is offered to the reader whereby to understand how an Athenian audience would side with Admetus against Pheres in their altercation on the score of contempt for old age, and in the spirit of patriotism. In like manner the satiric character of Heracles is traced out and justified. Neither his gluttony nor his stupidity is without excuse, as will be seen by those who study this thoroughly practical preface. Turning to the commentary, we can bear witness to its exactitude and thoroughness. Basing itself on a thorough study of Bishop Monk's notes, a mine of sound scholarship which has given a good foundation to many elder scholars, it nowhere forgets to attach due weight to his time-honoured dicta of scholarship. It explains such passages as *χέρα τοξήρη φρουρεῖς ὁπλίσας* (35) by taking the adjective as proleptic with *ὁπλίσας* and comparing it with (385) *σκοτεινὸν ὄμμα μου βαρύνεται*, "my eye is weighed down in darkness," draws due attention to the monostich dialogue (38-63) between Death and Apollo, as appreciable by an Attic audience accustomed to legal word-fence, and parallels the sentiment in 59 by Cardinal Beaufort's passionate apostrophe to Death in Shakspeare's *Second Part of Henry VI.*, iii. 3. Good notes will be found on *κατάρξωμαι ξίφει* (74) and *χαίτα . . . τομαιος* (101), where, however, the reading *χαίτας τομαιως* is preferred. In 156, though *πᾶς* for *ὁπᾶς* is confessedly rare, we concur with the editor in accepting *πᾶσα πόλις* as "the whole city," *πόλις* here ranking as a proper noun. In 173, the transitive use of *ἄκλαυστος ἀστένακτος* is well illustrated from Od. iv. 493; and in 194, *οὔτις ἦν οὕτω κακός*, "none was so vile or mean," is instanced in proof of Euripides's sympathy with slaves; cf. *Med.* 54, *Orest.* 870, &c. *A propos* of suicide, the semi-chorus in 229-30 delivers itself of the sentiment *ἆρ' ἄξια σφαγᾶς τάδε, καὶ πλέον ἢ βρόχῳ δέρην οὐρανίῳ πελάσται*—*i.e.* enough to make one cut one's throat, and more than enough to make one hang oneself; and hereupon Mr. Jerram notes that, though in the *Helen*, 298, stabbing is reckoned more honourable than hanging, here there is no such distinction. He is clearly right, too, in discriminating in 238 the true meaning of *οὔποτε φήσω*, "I will ever maintain," as not *i.q.* "semper negabo," as it is taken here and at 198 by Monk and others.

We must turn now for a short space to Mr. Cluer's *Memorabilia Socratis* of Xenophon, designed by him to lead the self-educating student, with the due use of his lexicon, to familiarize himself with Greek idiom. Only in revision have the school editions of Kuhner and Breitenbach been consulted, while in derivations the teaching of Curtius has been followed discriminately. A preface strives to clear the credit of the so-called "Sophists" from the reproach of charlatanism and conceit, so wholesalely charged against Gorgias Hippias and the rest, and distinguishes between the position of the advanced Sophists and that of Socrates. This also includes a sketch of the trial and death of the latter, Xenophon as well as Plato having preserved his apologia. After this, and as introductory to the text of the first book, we have an essay on the Religious Beliefs of Socrates; the second is introduced by an essay on the Socrates of Xenophon; the third is prefaced by an account of the Cyrenaic and Cynic schools; and the fourth by another essay on the Dialectical method. The first shows Socrates as a religious man, given neither to scepticism nor to superstition, and careful to attend public religious ceremonies. The historian is eloquent concerning his conduct after Arginusæ, and rebuts the charges of his demoralizing the youth of Athens and inspiring contempt for law by citing examples of his life and conduct. He shows, too, how far he was responsible for the two leaders, Critias and Alcibiades, and the faults of their characters—to wit, in setting them an example of *αὐταρκεία* which they misconstrued and misused. One or two samples may be adduced out of the first pages of the practical usefulness of his cullings from Curtius and other annotators and grammarians—*e.g.* in p. 14 the note on *οἴκοι*; as a locative case—cf. *χαμαί*, humi, domi, Romæ (Romaï, old form), Corinthi, &c., *ibid.* p. 14, the note on *ὡς*, "on the ground that," or "because," and on the force of the verbal adjective *ποιητέα* and its meaning and uses, Greek and Latin. With regard to *μηδὲν τῶν τοιούτων οἰομένους δαιμόνιον*, in § 9, a good note shows that *μὴ* instead of *οὐ* has a subtlety which "escapes any English rendering. It implies here a sort of vagueness—a doubt that any one would really think that the future was in any way affected by Divine Providence. The finer shades of meaning may be best detected by carefully remembering the emphatic character of the other negative particle." Mr. Cluer's volume may be commended as a praiseworthy elucidation of *Xenophon's Memorabilia of Socrates*, of which it would be impossible to speak more at length within such limits.

In connexion with such sterling examples of Greek prose and poetry it should be enough to note Mr. Wilkins's work and delectus, based on a blending of Parry's Greek Grammar with Abbott and Mansfield's Primer, and Dr. Curtius's Accidence. This delectus is exemplary and systematic, and teaches *pari passu* accidence, syntax, and construing-practice, preserving throughout a consistent addiction to Attic Greek, and avoiding at once unusual words and irregular forms. As far as our examination goes, we should say that the teaching of the accidence is ably reconciled and well enunciated, whilst the examples are not wanting either in aptness or life. Take the twentieth miscellaneous passage, which runs as follows:—

> *Λαβὼν τίς ποτε παρά τινος τῶν γνωρίμων οἶνον χρηστὸν μὲν ὀλίγον δε, καὶ ἀκούσας ὅτι δεκαέτης ἐστί, "μικρὸς ἐστιν ὡς πολλῶν ἐτῶν" ἔφη.*

Turning to the note hereon we find *λαβὼν* is to be rendered "on receiving," and are referred to a note on *λαβομένη* extr. vi. above, anent *χρηστὸν—ὀλίγον τε* we are reminded that the former applies to quality, the latter to quantity. Anglicè, "It is very little of its age," is *i.q.* *μικρὸς ἐστιν ὡς πολλῶν ἐτῶν*, and an apt parallel is adduced from Captain Gronow's "Recollections." Lord —— was always praising his champagne for its great age, and offering it in very small glasses, when Foote, the actor, remarked, "It is very little of its age."

MR. GLADSTONE'S ILLNESS.

THERE seems every reason to hope that Mr. GLADSTONE is not only out of all danger, but is steadily regaining health. The alarm, therefore, which the news of his illness awakened is at an end, and there may even be reason to rejoice that he has had a warning if he will but be warned. He has been greatly overtaxing his strength, considerable and unusual as his strength is. For some days he had shown signs of exhaustion, and was decidedly unwell on Friday evening. Undeterred by the premonitory symptoms which showed themselves with sufficient violence to impress any ordinary man of seventy, he insisted on going down to the House. Fortunately for him, as it happened, he found that the House had been counted out, and so could go quietly and with a good conscience to bed. It happened that this count-out was the cause of much angry feeling. Mr. ASHMEAD BARTLETT was to bring on one of the endless motions which deal with big subjects, but generally deal with them in a manner that awakens no interest and leads to no result. Those who habitually bring forward these motions are apt to be regarded as bores and enemies of Parliament. The defence of the House against bores is to keep away from the scene of boredom, and a count-out is recognized as the legitimate mode of escape. The Government on Friday night was represented by only one Under-Secretary, and it has been alleged that this Under-Secretary did not remain passive, but used very active measures to dissuade members who were proposing to attend from taking their seats. This, it must be owned, was a strong step on the part of the Under-Secretary. But this erring Under-Secretary may have the consolation of thinking that by a strange accident he has done more than any other man in England except Dr. ANDREW CLARK to save Mr. GLADSTONE's life. On Saturday Mr. GLADSTONE, though exceedingly unwell, was preparing to attend a Cabinet Council, when happily he was met by Dr. ANDREW CLARK, who peremptorily ordered him to go to bed. Very serious symptoms ensued, and there was good ground for the apprehensions that were keenly felt from one end of the kingdom to the other. Rest gave relief, the great physical powers of Mr. GLADSTONE asserted themselves, and when once the turn was taken there was no relapse. Dr. CLARK seems to think it even possible that Mr. GLADSTONE may appear in the House of Commons again this Session. It is very much to be hoped, though perhaps scarcely to be expected, that the experiment will not be tried. Mr. GLADSTONE loves work, and no doubt his devotion to the interests of the public is the mainspring of this passion for unremitting labour. But devotion to the interests of the public must be shown in different ways at different times, and at the present time Mr. GLADSTONE can best show this devotion by keeping quiet and trying not to kill himself. No doubt it would be a great sacrifice on Mr. GLADSTONE's part to abstain even for a single day from pervading Parliament with his unceasing energy, but sacrifices of some kind must occasionally be made. Mr. GLADSTONE can scarcely help feeling that the best return he can make to his countrymen for the generous sympathy they have shown in his illness, and for the abundant affection and esteem they have manifested, is to pay them the compliment of taking care of his health.

That Mr. GLADSTONE's illness would be watched with the keenest interest by the large masses of the population, both in London and the provinces, was a matter of course. He is as much the popular favourite as ever, and enjoys all the bad and good of an enthusiastic popularity. It has been said, and probably without exaggeration, that his illness has excited more general interest than any similar event since the illness of the PRINCE OF WALES. It was also a matter of course that every section of the Liberal party should testify its attachment to the leader who had done so much for it. The QUEEN, too, always does what it is her duty to do as head of the State, and displayed her accustomed anxiety to know every incident of an illness which seemed to put the life of one of the great servants of her Crown in danger. But what was really striking was the attitude of those who most warmly oppose Mr. GLADSTONE in public life and differ from him most widely. Whatever they may think of his sayings and doings, they honestly and cordially recognize his greatness. They feel proud of him just as Liberals, whose hearts are not perverted, feel proud of Lord BEACONSFIELD. This feeling is quite independent of political approval or disapproval. It springs from the satisfaction with which Englishmen recognize that their country can produce great men. Few people would say that Mr. GLADSTONE belongs to the type of wise far-seeing statesmen. No one with so much influence has ever inspired more doubts as to whether he is right in leading where he leads. But he is a Saul in the House of Commons. He is a head and shoulders taller intellectually than the people round him. He can speak as no one else can speak, and dominates by unquestionable eminence of mental gifts and by sheer force of character. He has played for so many years a leading part in English politics, that the history of our times seems written in his career. He has, too, the charm of being transparently sincere, and sincerity in a statesman has its charms which it is impossible to resist, even when common sense tells us that it is easiest to those who act on unconsidered impulse to seem especially sincere. But this honest recognition of greatness must be put to the credit of those who render it, as well as of those who awaken it. Lord BEACONSFIELD, whatever may be his failings, is singularly free from any tinge of petty ill-feeling, and although he could scarcely go himself, he sent his Achates to inquire at Mr. GLADSTONE's door. It is yet more significant to find in the list of inquirers the name of the Duke of BUCCLEUCH. If any one might be supposed to be naturally offended by Mr. GLADSTONE, it is Lord DALKEITH's father. It is an encouraging sign of the healthy state of English political life when both political parties can master all personal feeling, and, forgetting everything else, can remember only that a great Englishman lies in danger of death.

Mr. GLADSTONE's illness is attributable to overwork, and this overwork has arisen not so much from his holding the office of Prime Minister as from the mode in which he thinks proper to discharge the duties of his office. He is always present, always directing, always ready to answer, to defend, or criticize. Some additional work must necessarily be thrown on a Prime Minister who is also Chancellor of the Exchequer, but purely

financial work is so familiar to Mr. GLADSTONE and so palatable to him, that he would probably scarcely feel the extra burden which the Chancellorship of the Exchequer casts on him. When he last held office he was almost to the close of his Premiership only Prime Minister. But he worked as Prime Minister just as much and just in the same way as now. He takes the work, or at least shares the work, of every department and eclipses his colleagues as much as he eclipses ordinary members. In some respects this method of working the office of Prime Minister has its advantages. The Ministry gains in weight so far as at any given moment it is able to bring its greatest force to bear. The Opposition, too, finds pleasure in it; the greater members of the Opposition because they thus get to the end of things quickly and decisively; the lesser because they hope to shine by irritating, perplexing, or discountenancing the greatest adversary with whom they could have to deal. But the disadvantages are very serious. Mr. GLADSTONE's colleagues seem more of dummies than it is convenient they should seem, and one man cannot go on for ever doing the work of six. It will be very hard for Mr. GLADSTONE to abandon his method, for it is a method not adopted of set purpose, but because it is so thoroughly natural to him. He does not wish to make his colleagues dummies, nor does he distrust those whom he supersedes. But he loves debate, and feeling that he knows the right thing to say, according to his views, he obeys an irresistible impulse to say it. He feels so keen an interest in what is going on that he longs to make every passing shadow of his thoughts sweep over the field of discussion. But however his method may have been adopted hitherto, and whether it is in itself good or bad, it is a method which he must henceforth abandon if he wishes to do the greatest good to his country that he can do. For the real permanent incontestable duties of a Prime Minister there is every reason to hope he may have sufficient strength. He can guide the deliberations of the Cabinet and can exercise a general supervision and control over the conduct of debates and the proceedings of Parliament. He might also fulfil another function which at present he seems to consider as beyond his scope, and see that Ministerial measures are drafted with a decent amount of care and intelligence. But he must knock off something, and the easiest and best thing to knock off in his case is what is the extraneous and accidental work of a Prime Minister, a kind of work which he does not because he is Prime Minister, but because he is Mr. GLADSTONE.

AFGHANISTAN.

THE correction of General PRIMROSE's indiscreet statement has caused a certain feeling of relief; but the gravity of the actual disaster needs no exaggeration. A considerable force of English and Indian troops, after deliberately offering battle, has been defeated by an Afghan army in the open field, with the loss of half its numbers, of three guns, and of military reputation. One Radical writer at home finds by this time that he was premature in gloating over the assumed cowardice of the 66th Regiment in comparison with the native troops. It now appears that the Sepoys were the first to break; and it may well have happened that the small body of English infantry was unavoidably overpowered. The Artillery maintained the honour of their force at the cost of many valuable lives. It is possible that the General in command may be able to vindicate his character for prudence and skill; but no explanation has yet been offered of his alternate retreat and advance, or of his abandonment of a post which he had originally selected for its capability of defence. For the division of a small army of 4,000 or 5,000 into two widely separated bodies, while the enemy was approaching in far superior force, General PRIMROSE is responsible. It is surprising that the strength of AYOUB KHAN, and especially his possession of a powerful artillery, should have been ignored both at Candahar and at head-quarters. It appears that the superior range of the English guns was insufficient to counterbalance their inferiority in number. It is now certain that the difficulties of the march from Herat to Candahar had been greatly overrated, for the Afghan army must have advanced by roads practicable for artillery. Field-guns ought not to be formidable in a siege; but it is not at present known whether General PRIMROSE has on his part any heavy artillery. Just uneasiness has been caused by the statement that he has abandoned the defence of the line by withdrawing his troops into the citadel. If the account is true, the whole able-bodied population of Candahar will be added to the strength of the enemy, unless indeed AYOUB or his followers find it more desirable to sack the city than to seek the aid of the population. If the citadel is untenable for want of water, those who have occ[illegible] Candahar for several months must have been unaccoun[illegible] and culpably negligent. The hesitation of AYOUB KHAN to advance after the battle suggests the hope that he may not even commence the siege before the arrival of General PHAYRE, but the facts are at present imperfectly known.

Military authorities differ on the expediency of detaching a considerable force from Cabul to the scene of warfare; but Sir DONALD STEWART's own judgment, if he is acting on his own discretion, is entitled to confidence; and Sir F. ROBERTS has on many occasions proved his capacity for fighting. If he is really marching to Candahar, he will, it appears, be five weeks on the road; and long before the expiration of that time it may be hoped that General PHAYRE will have relieved the garrison. It is not known by whom the various movements are directed at head-quarters. The COMMANDER-IN-CHIEF, though there has been war during nearly his whole term of office, has seldom been mentioned in records of military movements. He may or may not enjoy on the part of Lord RIPON the confidence which seems to have been withheld by Lord LYTTON. It is unfortunate that, if Sir FREDERICK HAINES is equal to the duties of his high office, he should never have found an opportunity of making his ability known to the world. The indifference to military qualifications which produced disastrous results in the old Afghan war, and which endangered the Empire at the beginning of the Indian Mutiny, is not wholly obsolete. On the whole, the administration of the army is probably improved; and both the English and the Indian Governments have shown commendable activity in the present crisis. Some professional critics have disputed the necessity of sending reinforcements from England; but it is better to err, if at all, on the safe side than to incur any risk which can be avoided. It may be desirable to convince the people in some of the provinces of India that the strength of the Government is not seriously impaired by the catastrophe in Western Afghanistan. The Indian Government is pushing forward troops in the direction of Candahar, and it may be hoped that if General STEWART's remaining force is insufficient, he will receive early reinforcements. It is possible that Sir F. ROBERTS may have been directed to proceed no further than Ghuznee, from which he might, as circumstances required, move either on Candahar or on Cabul. It can scarcely be true that the Government has taken this opportunity of evacuating Cabul.

The political consequences of the defeat cannot yet be fully ascertained; but it is more profitable to calculate the chances of the future than to inquire into the share which political parties or successive Ministers and Viceroys may have had in a policy which has not been fortunate. A fortnight ago all parties believed that it was in the discretion of the Government to relinquish or to retain a position which was not thought to be exposed to serious danger. Henceforth there may be no question of permanently occupying Candahar; and it is possible that when peace is re-established Quetta also will be abandoned. There might, until the present time, have been a question whether good faith required the maintenance of SHERE ALI in the government to which he had been definitively appointed by the late Viceroy. It is now certain that [illegible] no hold on the loyalty of the po[illegible]tion, and that he could not, even if he we[illegible] stored, secure the obedience of the city and province after the withdrawal of the English garrison. It would be absurdly unjustifiable to impose the rule of a nominee of the Indian Government on a population which has perhaps already been exposed without defence to plunder and oppression. If no further calamity occurs, a heavy price will have been paid for release from a political embarrassment. From the language which has been used on several occasions by Lord HARTINGTON it might be conjectured that the Government had determined on the ultimate abandonment of Candahar; but the question was so complicated that in the negotiations with ABDURRAHMAN Mr. GRIFFIN was not authorized to discuss any matter relating to Candahar or Herat. The only doubt

which now remains is whether the former kingdom of Dost Mahommed will be reunited, or whether it will for the present be divided into two or three principalities. It is impossible to overlook the contingency that Ayoub may be able to claim the two provincial capitals in virtue of the indisputable right of possession. It is also certain that he will aspire to the succession of the whole kingdom. It must be remembered that part of his force consists of regular troops from Cabul, who once belonged to the Ameer Shere Ali's army. Unless the superiority of the English arms is successfully reasserted, a march on Cabul may be thought more easy and more hopeful than the original advance from Herat to Candahar.

The accounts of the progress of negotiation with Abdurrahman are but partially satisfactory. Up to the date of the latest accounts, he had refused to visit the English head-quarters. As might have been expected, he affected no change of demeanour on the arrival of the news from Candahar; but he must be well aware that his relation with the Afghan people and with his English patrons is largely modified. There can be little doubt that if Ayoub retains his advantage he will be accepted as the national representative and hero. No other Afghan chief in the present generation has achieved so great a victory; and the destruction of the remnant of the British army by Akbar Khan forty years ago was not effected in open battle. On this ground it seems that Abdurrahman would best consult his own interest by cordially accepting the English alliance. In the probable event of the ultimate overthrow of Ayoub he will be relieved from a formidable competitor; and a prudent Afghan chief is likely to believe that the Indian Government will not easily acquiesce in defeat and failure. It is nevertheless unsafe to rely implicitly on any calculation as to the course which may be taken by an ambitious Afghan chief. His course will certainly be determined by the estimate which he may form of his own interest; but the grounds and the result of the calculation must be accurately known. It is probable that, by this time, emissaries from Ayoub have arrived in Abdurrahman's camp for the purpose of inducing him by promises and threats to join his fortunes with those of his kinsmen. It is not likely that one Barukzye chief would rely implicitly on the word of another; but Oriental diplomacy is rendered possible by the assumption that promises and pledges are not wholly worthless. Mr. Lepel Griffin and Sir Donald Stewart may be trusted not to err through rashness or excessive credulity, and perhaps they may succeed in convincing Abdurrahman that his best chance of retaining the rank of Ameer depends on English support. The risk of his consulting Russian interests appears never to have been seriously apprehended; and for the present no Russian interest is in any sense affected by the negotiations. The report that Russian officers accompany the arms of Ayoub Khan, is probably founded on mere conjecture.

THE IRISH DISTURBANCE BILL.

The debate on the Disturbance Bill in the House of Lords was, as usual on great occasions, weighty and instructive. Full justice was done to almost every point of view in which the Bill can be regarded. Lord Granville thought it expedient to depreciate as much as possible the practical importance of the Bill. It was, he said, a small administrative measure subject to great limitation both of area and of duration. Lord Emly, one of the most effective of his supporters, nevertheless complained that the Bill would operate over three or four times the extent of country to which it ought to have been confined. He also expressed his belief that protection would be afforded to only an insignificant fraction of the tenantry. Lord Derby objected with much force to the term of eighteen months during which evictions are to be prohibited. In his judgment it would have been sufficient to fix a term ending on 1st of next July. If the tendency of the Bill is minimized, and if its advocates think it is nevertheless unnecessarily stringent, it cannot have been worth while to violate for a trifling purpose the fundamental principle of respect for property. There is little doubt that Mr. Forster when he first thought of the suspension of rents was wholly unconscious of the gravity of the issue. No statesman of his ability and character would have intentionally risked the disruption of his party, and the alarm and irritation which his proposal has caused throughout the country, for the sake of an enactment which was only worthy to be placed as a clause in the Bill for the Relief of Irish Distress. The unpremeditated introduction of the measure accounts for the levity with which its provisions were altered and realtered. At one time a clause was offered by the Government which would have created a tenant right assumed to have a pecuniary value, which was nevertheless defeasible on the expiration of the statutory term. With equal carelessness the limit of exemption from disturbance was altered from 30*l.* to 45*l.* at the dictation of Mr. Parnell.

One of the most powerful speeches against the Bill was delivered by Lord Lansdowne, whose secession from the Government had been in itself an answer to the arguments which are used to extenuate the gravity of the Bill. A Liberal by birth, education, and conviction, standing while still young on the threshold of the Cabinet, would not have resigned office and opposed his friends and late colleagues if he had not in his capacity as an Irish landlord perceived the danger to be serious and immediate. Lord Grey had demonstrated the theoretical anomalies of the Bill. Lord Lansdowne showed that the general proposition was strictly applicable to the Ministerial scheme. Lord Waterford, another great Irish proprietor, impressed on the House of Lords with the force of evident earnestness the belief which he shares with almost all his threatened class, that the Bill would not only inflict great hardship, but directly encourage the communistic agitation which it is intended to conciliate or divert. Lord Granville's small administrative measure is regarded by Irish landlords as the signal and commencement of their ruin. The precedents which have been cited in support of a plain infringement of the rights of property are utterly inapplicable. The power of Parliament to expropriate owners for public objects is undoubted, though in every instance it is narrowly watched; but in all cases but the present compensation is provided. The landowner under the Disturbance Bill would bear the whole sacrifice which is supposed to be required for the public good. As Lord Derby significantly observed, the measure has been defended by arguments which would fundamentally affect the contracts between landlord and tenant in Great Britain as well as in Ireland. Mr. Shaw-Lefevre referred to the French law, which, in default of express stipulations, relieves the tenant in certain cases from his liability to rent. He inferred that English contracts, founded on an opposite custom, should be construed by the foreign law, or rather by a system of customary tenure which only prevails in the absence of express stipulation. The only tenable argument which might justify a vote in favour of the Bill was urged in the first part of his speech by Lord Derby, and afterwards answered by himself. He voted for the second reading only because the Ministers have declared that the Bill is necessary to enable them to maintain the peace of Ireland; yet he would have preferred that the Bill should not have been introduced; and he would not have voted for the present reading if it must have been passed or rejected in the form in which it was presented to the House of Lords. He was, therefore, prepared to move or support amendments which might perhaps have diminished the objections to the Bill; but would not, if the Government may be trusted, have enabled it to repress disorder. The Bill has from first to last been represented as the smallest measure by which discontent could be in any degree appeased. Lord Derby's suggested amendments, if they had been inserted in the Bill by the House of Lords, would possibly have been rejected by the Government and the House of Commons; and even if the Bill had passed in its altered shape, it would have been denounced by the agitators as a useless mockery of concession. The exposition of the difficulties with which a County Court judge would contend in administering the Act was highly characteristic of Lord Derby's habitual good sense; and of his unwillingness to draw a practical conclusion from sound arguments. As Lord Salisbury observed, the judge could not express his perplexity better than in Lord Derby's language. If he supported the Bill in reliance on the statements of the Government, he ought in consistency to have accepted it as a whole.

Lord Cairns's exhaustive speech completed the demolition of all the arguments for the Bill except Lord Derby's. It is still undeniable that the introduction of the measure has made the rejection of it in some degree dangerous. It is impossible, as Lord Derby added, to revert to the state

of affairs which existed only two months ago, but the Ministers are exclusively responsible for the discontent which may be provoked by the defeat of the Bill. They ought to have foreseen that it would be rejected by the House of Lords, though they could scarcely have apprehended so overwhelming a majority. The truth is that they blundered into erroneous legislation, and that they conducted it through all its stages with the same reckless imprudence. As Lord CAIRNS truly said, their statistics and their arguments were produced after the proposal which they purported to justify. The Duke of ARGYLL probably remembered the errors of his colleagues when he began his eloquent apology for the Bill with the admission that it was liable to many objections, both theoretical and practical. It was necessary either to defend it or to break up the Government, and the Duke of ARGYLL cannot be blamed for maintaining his loyalty to his party and his colleagues. He would nevertheless have refused his assent to the Bill, if he thought that it recognized a proprietary right in tenants, or that it extended the principle of the Act of 1870. It is not difficult to perceive that the Duke of ARGYLL will not concur in the wild measures which are recommended by politicians of the school of Mr. BAXTER; and it may be doubted whether, if he had not been a party to the policy of the Government, he would have supported the measure. The rift which has appeared in the Liberal party is certain to widen more or less slowly. The organ of the more revolutionary Radicals is not careful to maintain the reticence which represented the sincere convictions of Lord GRANVILLE and the LORD CHANCELLOR. The House of Lords is reproached with the sanction of the landlord's right to destroy a property created by "the equity of the Act of 1870" when the tenant has, by no fault of his own, failed to comply with the terms of his contract. Lord DERBY and the Duke of ARGYLL must incur the same censure, which indeed applies to the Government itself. By the admission of the promoters of the Bill, the property and the equity are to have no validity except for the next eighteen months. The zealous supporters of the measure, both in England and in Ireland, agree in Lord CAIRNS's explanation of the principle which it involves. The same ingenious commentator finds in the largeness of the majority a proof that it was influenced, not by argument, but by prejudice and passion. The fifty-one peers who voted for the Bill have no reason to fear any imputation founded on their numbers. Several of the Ministerial supporters hold office in or under the Government, while the remaining forty either preferred their party to their opinions or thought that the passage of the Bill would be the smaller of two evils. If the published analysis of the numbers is accurate, the Bill would have been thrown out by sixty-three Liberal votes to fifty-one if the Conservatives had abstained from taking part in the division. Two peers, created on the recommendation of Mr. GLADSTONE within a few weeks, voted against his Government. The Duke of BEDFORD, recently appointed Chairman of the Irish Land Commission, absented himself, perhaps because he may have thought it right not to commit himself to a doubtful scheme.

THE FRENCH DEPARTMENTAL ELECTIONS.

THE elections to the French Departmental Councils have ended in a decisive victory for the Republicans. At the next election of Senators the modification of the Second Chamber in a Republican direction is now assured. This result will rightly be interpreted, not merely as a demonstration in favour of the Republic, but as a demonstration—at all events a negative demonstration—in favour of the particular policy lately pursued by the Republic. It is plain that if the decrees against the religious orders had produced anything like the reaction which it was asserted they would produce, the elections to the Departmental Councils would have afforded an excellent opportunity of making this reaction felt. Republican councillors would not have been put in the place of Conservative councillors in one department after another in all parts of France. The elections to the Councils General are in some ways more significant than any other. Even a Republican may be tempted to consider the interests of the district in which he lives more than the interests of the country at large. Where the election is merely to a seat in a local body—a body charged with a vast number of concerns which touch the district very closely while they do not touch the country at all—it would not have been strange if regard for local interests had prevailed over political considerations, and the landowner or the manufacturer had been returned without reference to his politics. Just the contrary has happened. The one political function which a member of the Council General can expect to discharge has been the one on which the elections have turned. The voters have, so to speak, gone out of their way to parade their confidence in the present order of things, and they have done this at a moment when, according to some accounts, the tide was beginning to turn. The elections to the Councils General could not have been held at a more opportune moment. All the predictions of coming disaster to the Republican Government have been completely falsified by the event. The electors throughout a large part of France have had an opportunity of saying unmistakably whether the recent action of the Cabinet has in any way weakened their confidence in it, and they have used the opportunity in a most unmistakable way. The execution of the decrees against the Jesuits is still fresh in their minds; but when they go to the poll it is only to vote for a councillor who, when a senator has to be voted for, will vote for the Government candidate. Nothing can show more clearly that, whatever else the decrees against the religious orders may have done, they have not alienated the great body of the nation. That is still Republican; still disposed to trust M. GAMBETTA; still willing to accept M. DE FREYCINET or any other Prime Minister by whom it shall please him to make known his will. M. GAMBETTA has not made the blunder which some of his critics have attributed to him. He has not outraged an institution which the French nation holds dear. On the contrary, he has singled out for attack an institution for which the French nation taken as a whole cares nothing at all.

This result is not surprising. The crusade against the religious orders has its risks, but they are not of a kind to become patent at this time in an election. The religious orders, especially the orders engaged in education, have nothing to do with the nation at large. Their services are valued by the upper and middle classes; and this fact alone would account to some extent for the indifference with which they are regarded by the poor. It would be almost as reasonable to expect an English election to turn upon the suppression of clerical fellowships at Oxford and Cambridge as to expect universal suffrage in France to be seriously moved by the wrongs of the Jesuits. The French peasant cares about his *curé*, not in the sense of either specially loving or respecting him, but in the sense of putting a certain value on his services. He would not like to see the village church shut up or the parish placed under a virtual interdict. M. GAMBETTA has hitherto gone on the plan of pacifying the wolves by the occasional sacrifice of a baby. The irreconcilables and he have no common ground except such as is afforded by their ecclesiastical hates, and even here they cannot go very far together. M. GAMBETTA wants to stop short at the religious orders. He would like, if he could, to make himself the patron and protector of the secular clergy, because the secular clergy are a part of that general order of things which the peasant does not wish to see disturbed. Two difficulties stand in the way of his doing this. The first is that the secular clergy refuse to be won over. They insist on making common cause with the religious orders and treating the attack upon the Jesuits as an attack upon the Church itself. M. GAMBETTA has some right to consider this a hard stroke of fortune. It is known to everybody that the *curés* have no love for monks, that they grudge them the devotion they receive from rich ladies and the contributions they intercept on their way to the parish church. Whether these contributions would find their way to the parish churches if there were no monks to intercept them may perhaps be doubted. Religious benevolence sometimes requires the stimulus of a little excitement, and this is not easily extracted from the commonplace *curé* and the dull functions of a French village church. But the *curé* naturally lays the blame at the door of the religious orders, and when he hears of the new sanctuary lamp or the magnificent set of vestments which a wealthy parishioner has presented to the church of a neighbouring convent, he looks with natural soreness on the poor furniture of the parish altar and the dingy robes of the parish priest. But, then, if the Republican Government wanted to turn this jealousy

to useful account, they should not have contented themselves with attacking the religious orders. Such a measure taken by itself had nothing in it calculated to win over the parish priest to the Republic. It might be simply the forerunner of a general attack upon the clergy, in which case it would be clearly good policy for the clergy not to allow themselves to be beaten in detail. Had the Government done something to enlist the secular clergy on their side the case might have been different. They might have doubled the salaries of the worst-paid *curés* without doing more than giving means to live upon in comfort, and the offer of such a bait would probably have made a great, even if unconscious, change in the attitude of the clergy towards the civil power.

Here, however, comes in the second difficulty. The object of attacking the religious orders being to conciliate the Extreme Left, it was useless to accompany that attack by a measure which was certain to alienate them afresh. The whole strength of the Government would have been taxed to carry a proposal to increase the salaries of the *curés* through the Chamber of Deputies, and it might not have been sufficient for the work. If it had been carried the offence given to the Extreme Left would have been quite great enough to forfeit all the advantage that had been gained by the issue of the decrees. The Extreme Left are thoroughly logical upon this question. They recognize the substantial identity of the two classes of clergy, and they are anxious that if one suffers the other should be made to suffer with it. That the parochial clergy will not profit by the dissolution of the religious orders is not enough for the Extreme Left. Their desire is that the two should be involved in a common destruction, and they already show signs of demanding that the process begun with the religious orders should be extended, so far as the withdrawal of their pay is concerned, to the whole body of the French clergy. To judge from their previous action, they will be as hostile to a Government which refuses them this as they could have been to a Government which had refused to pay any attention to their earlier demands. M. GAMBETTA may still find that he has to choose between seriously alienating the great body of Frenchmen and breaking with the Radical Left.

SOUTH AFRICA.

THE recall of Sir BARTLE FRERE will cause little surprise, though the official statement of the reasons for recalling him is open to comment. It is not known, except from the statements of Lord KIMBERLEY and Lord HARTINGTON, that there is any present difference of opinion between the Government at home and the HIGH COMMISSIONER. He is really dismissed because the Ministers when they were in Opposition attacked the late Government for retaining his services after the Zulu war. There is little difference of opinion in England as to a policy on which in South Africa a directly contrary judgment is formed. It was unnecessary, and therefore wrong, to make war on CETEWAYO; but the colonists look rather to the unqualified success of Sir BARTLE FRERE's measures than to the questionable morality of an unprovoked war; or to the heavy losses and temporary discredit incurred by the Imperial troops. The Zulu power seems to be permanently broken; and, partly in consequence of acts which have been censured by two Ministries, and in a great degree through the influence due to his personal qualities and character, Sir BARTLE FRERE is more popular in the Cape Colony than any of his predecessors. If it is true that the present colonial Cabinet has depended on his support, no better proof could be given of the esteem in which he is held by a jealous and independent community. If the proposed disarmament of the Basutos causes another petty war in South Africa, the Home Government may perhaps refuse to allow the QUEEN's troops to take part in the contest. In this instance the Cape Colony has acted on its own discretion; and, although Sir BARTLE FRERE retains his popularity in South Africa, the Legislature and the Ministers are exclusively responsible for a policy which they have deliberately pursued. Some members of the minority which opposes disarmament avowedly regret the establishment of colonial independence or self-government, probably on the ground that a colony which controls its own policy forfeits to a certain extent its claim to the aid of the mother-country. It is probable that in South Africa the concession may have been premature; but with its consequences it is irrevocable. The English Ministry has informed the GOVERNOR that, while it disapproves of the plan of disarmament, it declines to interfere with a measure within the competence of the local Government. The missionaries in Basutoland, including several foreigners, and some philanthropists at home, have remonstrated against the alleged injustice to the natives. One of the missionaries, Mr. MABILLE, who seems to be a Frenchman, delayed the issue of the proclamation by refusing to translate or to print it; and some comment was caused by the consequent necessity of employing a printing office at Bloemfontein, in the Orange River Free State. It is not certain that the Basutos have risen in insurrection; but some arms which certain chiefs had surrendered were retaken, probably with their connivance, by a native band. According to the latest accounts, the Assembly had passed a vote of confidence in the Ministers with direct reference to the question of disarmament. Hopes are entertained that the Basutos will submit without serious difficulty.

Basutoland, though it borders on Natal, and is far from the provincial capital, was annexed by the then Government to the Cape Colony in 1871. It was therefore a part of the territory to which the Responsible Government Act, passed in 1872, applied. The scanty white population is represented in the Assembly; and the natives, though they have no votes, are bound by colonial legislation. In 1878 a Peace Preservation Act authorized the Government to require by proclamation the surrender of fire-arms by the natives in any part of the colony. The Fingoes, or some of them, have already been disarmed under the provisions of the Act; and, after the defeat and death of MOROSI, it was thought expedient to take the same course with the Basutos. Their goodwill has perhaps not been conciliated by the mutilation of the body of MOROSI, the gallant chief of one of their tribes. His head was cut off by a zealous surgeon, on the pretext that he wanted to include it in a collection of skulls made for scientific purposes. The Cape Government has perhaps no power to punish a singularly brutal outrage; but the missionaries and other friends of the natives regard the proceeding as an illustration of the temper in which disarmament is likely to be prosecuted. It is difficult to judge at a distance of the merits of a disputed policy. The colonial Ministers remark that there is no game in Basutoland, and that the natives are not in the habit of amusing themselves by shooting at a mark. They infer that the only use of guns must be to facilitate rebellion, though it seems possible that Basutoland might be invaded by neighbouring tribes. A spirited race may not unnaturally resent the deprivation of the means of defence or even of attack. The measure appears not to be intentionally unjust. The Peace Preservation Act provides for payment of compensation for arms surrendered, and the Legislature will from time to time supply the necessary funds. It is also proposed to raise and arm a local force of natives whose loyalty may, as it is thought, be secured by discipline and regular pay. There is a wide difference between the general possession of arms by a population accustomed to obey its indigenous chiefs and the organization of a native force under colonial officers. Notwithstanding Mr. GLADSTONE's indignant denunciation of the India Arms Act, the possession of weapons of war is not everywhere and always one of the rights of man. Probably the Cape Government is better qualified than the Colonial Office to judge of the real question whether the disarmament is likely to be accomplished without bloodshed.

Mr. SPRIGG, Colonial Secretary and Prime Minister, has published an elaborate speech in defence of the policy of his Government, which was delivered in the Assembly on the 2nd of June. The personal hits and repartees which it contains are at this distance neither interesting nor intelligible; but Mr. SPRIGG's statements and arguments are comprehensive and clear. The only reference to Sir BARTLE FRERE is a complaint that the Ministers "are stabbed from "behind by men in the colony who urge on the Government and people of England to bring pressure to bear "against the most high-minded Governor who ever set "foot in South Africa." At the Cape, as in England, stabbing behind probably means criticizing, or doing anything else which is unpleasant to the speaker. No pressure can easily be brought to bear on the Governor, because he is covered by the responsibility of his Ministers. That Sir BARTLE FRERE still retains the confidence of the Cape Parliament is probably regarded by his assailants at

home as an additional offence. In the Zulu war Sir Bartle Frere exercised independent authority as High Commissioner. The Governor of the Cape has no power to prevent his advisers from carrying through Parliament any law affecting the whole or part of the colonial population. A great part of Mr. Sprigg's speech is directed to the laudable object of proving, not so much that his proclamation was politic, as that it was legal and constitutional. It seems to be fully authorized in point of form by the Peace Preservation Act; and the sanction of Parliament, which has since been given, is a guarantee for the vague quality of constitutional soundness. The former Ministers of the colony were in the habit of issuing licences to natives to purchase each a gun and a certain quantity of powder; and a large portion of the wages which were earned by temporary immigrants was received in the form of firearms. Many of the rifles which were used by the Zulus in the late war were obtained in a similar manner, in payment of wages for labour in the diamond fields. It is of course impossible to ascertain whether the guns sold to Fingoes or Basutos are still in the hands of the original purchasers, who may in some cases have sold them to members of other tribes. According to Mr. Sprigg, there is no contraband importation of firearms on the Western coast, but traders in the colony, as in all similar cases, probably violate the law for the sake of profit. It is only far in the interior of the continent that arms can be wanted for the legitimate purposes of hunting wild animals. The Colonial Government has probably no means of controlling the traffic with Delagoa Bay. The Portuguese Legislature has, within a few weeks, vexatiously refused to confirm a treaty by which the South African provinces would have secured a convenient outlet to the sea; but the Basutos are not likely to have intercourse with the coast.

The Parliament of the Cape, probably in accordance with the opinion of the constituencies, rejected the scheme of federation on the ground of unwillingness to share in the risk and burden of native wars to which the smaller neighbouring provinces were more immediately exposed. It is remarkable that the first alarm of possible insurrection should arise within the limits of the Cape Colony. If hostilities should occur they may probably spread, with the result of compelling the Imperial Government to undertake the defence of the Crown colonies. As long as the contest is confined to Basutoland, the Cape Government ought to be capable of dealing with a war of its own seeking. The community of interest of the South African settlements is proved by Mr. Sprigg's statement that it would not have been prudent to undertake the disarmament of the Basutos while the Zulu war was impending or during its continuance. It will, nevertheless, be for a long time useless to revive the scheme of federation; and it is especially undesirable that the Government at home should associate itself with a measure in which it will be supposed to have a selfish interest. A desire for union, suggested by local needs, would be more likely to receive favourable consideration; and it must be remembered that, although the United States and Canada furnish precedents of successful federation, there are other possible forms of union. The Cape Colony might perhaps hereafter be willing to extend its own dominions, though it declines a position on equal terms with less powerful communities. If annexation were effected, it would matter little whether it took the simplest form or the more complicated shape of a cluster of provinces united by a federal bond.

ALSACE-LORRAINE.

THE anonymous writer in the *Revue des Deux Mondes* who a short time ago opened his attack on the German administration of Alsace-Lorraine, has now completed his labours, and, in a very long and elaborate article, has said all that he could possibly find to say against the spoilers of French territory. He has studied and thought over his subject sufficiently to make all he says well worth considering; but he is so studiously partial, so persistently one-sided, that it is impossible to know when it is safe to follow him. The main point which he endeavours to demonstrate is that the inhabitants of the conquered province hate the Germans, will always hate them, and must always hate them. The Germans, no doubt, comforted themselves when they took possession of Alsace for military purposes by thinking that the Alsatians at any rate were fellow-countrymen of their own, and that they would be welcomed by those whom they were winning back into the bosom of their Fatherland. In this hope they have been disappointed. The Alsatians had got thoroughly accustomed to French rule. They did not feel so much that they were ruled by France as that they were incorporated with it. They were not one of the oppressed nationalities which yearn for deliverance by foreign aid. To them when the transfer of their political allegiance took place the French, who had once taken forcible possession of their territory, were friends and fellow-countrymen, and the Germans who had now forcibly recovered their territory were strangers and aliens. A French writer is quite entitled to express a patriotic pride when he finds that France has this gift of attracting and assimilating a foreign element. It must be to him a legitimate source of satisfaction that the Alsatians, although torn from France, have keenly regretted the separation. It is also highly probable that the inhabitants of the conquered provinces have more to bear than that blow to the feelings which a constrained change of country carries with it. They are said to be grievously bored and worried by the German officials who have come to reside among them, and it may safely be said that, to be grievously bored and worried by the unfamiliar presence of German officials is natural to the human mind. Then they pay more taxes than they used to do, and as the flow of their business is now towards a poorer country than France, they are not so well off as they used to be. But if these provinces were to be held by Germany at all, it is not easy to see how their inhabitants could have been treated better than they have been treated recently. Their anonymous friend does not deny that the German Government has made very considerable efforts to conciliate them, but he contends that these efforts have been, and must necessarily be, in vain; and he even goes so far as to suspect that these measures of conciliation were meant to fail, and were devised by Prince Bismarck with the dark design of proving that nothing can really succeed in Alsace-Lorraine except the institution of a Government on the pure Prussian model.

Marshal Manteuffel is now the Governor of Alsace-Lorraine. In the early part of last year it was decided to confer on the provinces a certain amount of independence. More particularly the number and powers of the Council were enlarged, so as to make it a sort of Parliament. The members are elected, and they are supposed to enjoy freedom of debate, and may regulate local affairs and local expenditure. This is called autonomy, and to grant so much was taken as a great concession to the party in the provinces known as Autonomists. Over this system of autonomy the Marshal was called, much against his will, to preside, by the express commands of the Emperor. In a country of officialism he is known as the most benign of officials; he has long enjoyed a special intimacy with the Emperor, and is said to be one of the few German statesmen who disapproved of the annexation of the provinces. In the discharge of his new duties he has shown himself, as the anonymous writer admits, courteous, equitable, and persuasive. It is indeed part of the writer's argument that, if such a governor could not conciliate the inhabitants of the provinces, then it follows that no one could. The Marshal and the Parliament find themselves perpetually hampered by the arrogant interference of the higher Prussian officials, and especially by the interference of Herr Herzog, the Secretary of State, who is represented as the chief instrument of the deep-laid plot by which Prince Bismarck intends to demonstrate the futility of autonomy. It is remarkable that the writer entirely omits to notice that some weeks ago Herr Herzog was recalled, and such an omission naturally suggests that the writer is one of those authors who, like Vertot, compose their history of a siege first, and find facts for it afterwards. But even the main point to be demonstrated, that autonomy has failed, is left in a very inconclusive state. The writer bitterly complains of the autonomists, whom he treats as false patriots ensnaring the people into a despicable forgetfulness of France. But he has to acknowledge that they are a powerful party, that they and even those of other parties who were returned to the Parliament took the oath of

allegiance to the EMPEROR, and that the Parliament has shown so much independence as to have evoked the threatening criticism of the officials. The Bishop of STRASBURG, too, appears to be working in harmony with the Government, which it is said shows he must be a very weak man. He may or may not be a weak man; but, at any rate, he works in harmony with the Government, and it is impossible to read this voluminous description of the present state of things in Alsace-Lorraine without a suspicion that the writer is in his heart afraid that the experiment of autonomy is succeeding rather better than he could wish, and that he occasionally paints the Alsatians as feeling what as a Frenchman he thinks they ought to feel rather than as feeling what an impartial inquirer would ascertain that they do feel.

Nothing is more difficult than to learn how a whole people feel not habitually and by tradition, but at any given moment when causes of change have begun to operate, and not as they express those feelings by acts, but as they feel in the recesses of their hearts. But when we come across such wonderful statements as that the young peasant women of Alsace now decline to marry and are willing to die old maids because they miss in their lovers that polish which mixing with the French army used to put on them, we are entitled to pause and to ask whether young Alsatian peasant women can be so different from other young women with whom we are acquainted? It may be remarked, too, that this notion of some wonderful polish imparted to Alsatians by intercourse with France, a notion to which the writer gives constant expression, is something quite new in French literature, and must seem the oddest of novelties to the readers of BALZAC. There are many precious things the worth of which is never recognized until they are lost, and while France held Alsace, without a thought of losing it, her lively writers used to speak of the Alsatians rather as quaint but useful boors, than as men who won the love of women by a borrowed exquisiteness of refinement. Then, again, the writer is bitterly contemptuous in relating how the MARSHAL on one occasion reminded his hearers that their lot had been cast for them, and suggested that the wisest thing they could do was to bow to the decrees of Providence. The writer is conscious of a decisive superiority on this head, and assures the Alsatians that he knows much more about the decrees of Providence than the MARSHAL does. It is quite true that Providence decreed that Alsace-Lorraine should be annexed to Germany; but then Providence decreed this not for the good of Germany, but that Germany might be punished and ruined by getting its foolish wishes granted. The writer evidently says this with perfect honesty and sincerity. His belief is that the possession of Alsace-Lorraine will be fatal to Germany. He does not look forward to, or desire, a war of revenge. It is not by retaking Metz and Strasburg that France will reconquer the lost provinces. It is peace, not war, that will bring the accomplishment of her desires. Having to defend Alsace-Lorraine, and being perpetually confronted with the enormous army which France has now organized, Germany will be obliged to keep on foot a much larger army than she can pay for without seriously crippling her resources. France is rich, and is growing richer every day, and can bear with ease the burden of her military expenditure. Germany is poor, and is said to be growing poorer, and every day feels more and more the strain which her army puts on her. France will ruin Germany just as a great man can ruin a lesser man who vies with him in keeping up a magnificent establishment. Prince BISMARCK, it is said, is fully alive to the certainty of this catastrophe, and the writer alleges that he had a great scheme of general disarmament in which he was supported by the late English Ministry, which would have checkmated the hopes of France, and which was only frustrated by the issue of the English elections. We have no means of saying whether this is true or not, but, if it is true, there is an irony of fate in Mr. BRIGHT having laboured so hard and so successfully with the result of having made a reduction of the bloated armaments of Europe impossible. But the speculations of the writer deserve serious attention when they refer not to England or Germany, as to which he does not seem to know much, or to the affairs of Alsace-Lorraine, which he seems to look at through coloured glasses, but to France, where he is very much at home. That France has only to keep quite quiet, avoiding everything like adventure and husbanding every penny she can save, in order to wear out Germany, is the conviction of a large number of influential Frenchmen, and affords a clue to much that might otherwise seem ambiguous in French foreign policy.

THE EMPLOYERS' LIABILITY BILL.

THE progress of the Employers' Liability Bill was delayed on Wednesday by a curious combination of over-ardent friends. Mr. SAMUEL MORLEY moved an amendment which Mr. DODSON refused to accept, and which was consequently rejected. But it was not rejected until a great number of speeches had been made in support of it. Lord RANDOLPH CHURCHILL gave the House the benefit of his careful study of the "literature relating to the subject." Mr. CLARKE declined to leave the interests of the working-men to the half-hearted care of the Government. Mr. GORST, undeterred by misconception and misrepresentation, insisted on rendering assistance to Ministers in getting the Bill through Parliament, and thought that the best form his help could take would be to press them to eat their own words. The Liberal benches yielded an equally zealous list of advisers. Mr. BRYCE hinted that without such an amendment as Mr. MORLEY's the Bill would be worthless. Mr. BROADHURST could not ask less for the workman than stout Conservatives declared themselves prepared to give him. With all this possibly unexpected backing, Mr. MORLEY found it impossible to give way. As the discussion went on it became clear that if the amendment were carried the position of the Government in regard to the Bill would be very seriously compromised. They have all along maintained that their object is to do a particular thing, and that this particular thing is not open to the objections which employers have brought against the Bill. Had Mr. MORLEY's amendment been carried the Bill would have done something quite different, and the scarcely lulled hostility of employers would again have blazed out. Opposition members are not bound to know this, and Mr. MORLEY's success would not perhaps have been less agreeable to them if it had led to the addition of one more failure to the Ministerial list. Liberal members, however, might have been expected to foresee this consequence more clearly, and to have resisted the infection of Conservative ingenuousness. How after so much show of support Mr. MORLEY's amendment was ultimately defeated is not very evident; but it is not impossible that its author was as well satisfied with the result as any one else.

The purport of Mr. MORLEY's amendment will be variously viewed according as the determination of the Government to limit the operation of the Bill to cases in which employers may be said to have indirectly contributed to the negligence out of which the liability has sprung. Mr. MORLEY proposed to include among the cases in which the employer should be liable, those in which an accident is caused by "the negligence of any "person in the service of the employer, engaged in a "branch or department of such service, separate and "distinct from that in which the workman was engaged." The argument in favour of this extension of the employer's liability is that, though workmen employed together can watch one another, and so, if they choose, guard against the consequences of each other's negligence, this is impossible when the workmen are employed in different branches of one large concern. In the case of a powder mill, for example, a workman who sees another lighting a match near a magazine has only himself to blame if he does not bring so dangerous a breach of rules to the knowledge of the foreman and have the offender dismissed. But supposing that the match is lighted in one department of the mill, and a man at work in another department is killed by the consequent explosion, what opportunity has there been for mutual watchfulness? The man who is killed may never have seen the man whose recklessness has caused his death; he may not even know that such a man is employed in the mill. Consequently, it is urged, as the reason for maintaining the exception of common employment falls to the ground, the exception itself ought to follow. This reasoning is sound up to a certain point. It establishes a distinction between the case for which it proposes to legislate, and ordinary cases in which the plea of common employment is supposed to exempt an employer from liability. This, however, is all that it does. It does

not disprove the need for maintaining the doctrine of common employment, it only shows that a justification for this doctrine which was supposed to cover all the cases that could be quoted only covers a part of them. The ground on which we have always defended the Government Bill is that it is neither just nor expedient to fine employers for accidents to which they have neither directly nor indirectly contributed. The object of fining them is to make them more careful for the future, but unless they have the choice of being careful or careless no amount of fines can possibly have this effect. Now the principal way in which an employer can contribute to the negligence of those employed in his works is by carelessness in the choice of agents. He does not and cannot choose his workmen; but he can and often does choose his foremen, and his caution in making this choice may be greatly stimulated by the knowledge that he is liable to his workmen for any injury they may sustain through the carelessness of these foremen. This is an intelligible line to draw; but if the Bill were extended as Mr. MORLEY proposed, it would be no longer drawn. The employer has no more control over the negligence of any person in his service engaged in a branch distinct from that in which the injured workman was engaged than he has over the negligence of a person employed in the same branch with that in which the injured workman was engaged. He has had nothing to do with hiring him, and if he is held liable to-day for some act of carelessness on his part it will not in the least help him to become more careful to-morrow.

What, then, is the ground on which it can be held just to impose on employers a liability for the negligence of men whom they do not choose in the first instance, and over whose acts they have ordinarily no control? We can see none, except that general assumption that he should pay who has the money which seems, we are sorry to say, to underlie most of the arguments in favour of abolishing the plea of common employment. In the case which has been already supposed—that of a man killed by an explosion in a powder-mill, this explosion itself being caused by the negligence of a workman employed half a mile off, of whom, and of whose manner of working, the victim knew absolutely nothing—why should the employer be held accountable? If the explosion were caused by any carelessness on the part of a foreman, the reason for holding the employer liable would be obvious enough. The employer would have chosen the foreman, and if he has not thought it worth while to see that his qualifications included the degree of carefulness that can be trusted to prevent accidents, he is justly held responsible for the injury which that carelessness has caused. In the case supposed by Mr. MORLEY the employer has not been careless. He has taken pains to appoint really careful agents; but the accident has been caused by the carelessness of a man who was not an agent. If it is asked why the workman should suffer by the act of a man whom it was impossible for him to watch, we ask in return why the employer should suffer by the act of a man whom it was impossible for him to watch. Dangers of this kind seem rightly to belong to the class of unavoidable risks which are rightly dealt with by a higher rate of wages or by a system of insurance. They are certainly not to be disposed of by the easy-going rule—first find where there is money sufficient to make compensation, and then place the obligation where the money is.

If the Government are well advised they will take no notice of the many suggestions made to them to reconsider this proposal on the Report. However carefully guarded it may be, it will remain in direct contradiction to the general scope of the Government Bill. If there were no other reason for refusing to accept an amendment of this kind at the last stage of a Bill, the injury it would do to the prospect of the Bill being carried during the present Session would be amply sufficient. Mr. DODSON has taken his stand on a reasonable compromise between the claims of the employer and those of the men. If he now throws over the claims of the employer altogether in so important a particular as that involved in Mr. MORLEY's amendment, the controversy will virtually be re-opened, and even on the third reading the Bill may fall through.

THE OXFORD ELECTION PETITION.

THE HOME SECRETARY is not a person who has much respect for anybody's advice, and therefore it is probable that an admonition on Wednesday afternoon, not to crow over an enemy until he was quite sure of his own position, would have had no effect on him. It was, however, certainly an unfortunate impulse which led Sir WILLIAM HARCOURT at Derby to triumph over his successful antagonist at Oxford. Mr. HALL has been unseated, and it is perhaps no unfair imputation upon the University town to say that no one who knows Oxford will be very much surprised at this result. But any one who knows Oxford could also have predicted that if the election had gone the other way, and f the HOME SECRETARY had been returned, his return also would not have stood the test of an election petition. The Judges in giving their decision have intimated this fact with sufficient clearness. They are of opinion that corrupt practices prevailed extensively at the late Oxford election, that both sides are tarred with the same brush, and that both colourably employed voters in a manner which cannot be described as innocent, necessary, or defensible. Under these circumstances Sir WILLIAM HARCOURT's exultation may probably strike a good many people as partaking not a little of the unwise as well as of the unseemly. By the blessing of Providence and of Mr. PLIMSOLL, he has been provided with a seat which cannot be challenged, and his late opponent at Oxford has been prevented from representing the constituency, in which he is certainly a popular candidate, during the existence of the present Parliament. Had the last Oxford election gone the other way, it is not doubtful that Sir WILLIAM HARCOURT would now be in this identical position. A judicious silence would therefore seem to be, on the whole, the best course for the HOME SECRETARY to pursue on this awkward subject.

The importance of the decision is, however, by no means limited to this somewhat personal aspect of the matter. Mr. Justice LUSH and Mr. Justice MANISTY have for many weeks been engaged in trying election petitions, and their judgment of Wednesday must be taken as expressing not merely their opinion of the particular case at Oxford, but their opinion on the whole subject of elections and election petitions in the present year of grace. They took, indeed, particular pains to let it be known that the judgment had this force, and it must be admitted by all who impartially read it that, whether we look to the past or to the future, its bearing is equally serious. Mr. Justice MANISTY says that, keeping in mind the small majorities by which many seats were gained at the general election, it cannot be doubted that candidates were in many instances seated by voters who had been gained from the other side owing to corrupt practices. That is to say, the "will of the "nation," of which we have heard so much, is, when translated from rhetoric into fact, simply the determination of a small proportion of the least respectable part of the nation to make the most of its privilege of voting with the aid of the secrecy afforded by the ballot. The same judge states distinctly his fear that secret voting, while it may have diminished bribery in the old sense, has introduced a new and complicated description of malpractice "whereby voters commit the compound offence of bribery, "falsehood, and fraud." Mr. Justice LUSH, while refraining from expressing so general an opinion as that of his colleague, made remarks on the particular case before him, which evidently bear out Mr. Justice MANISTY's strictures. He declared most unequivocally that both sides had carried the practice of employing voters as messengers, clerks, watchers, &c., to an altogether unjustifiable length. He admitted that the Ballot Act seemed to have had no effect in checking this practice. He took definite account of the remarkable plea set up that it was a matter of necessity to retain partisans and conciliate enemies by thus employing them "in face of the fierce competi-"tion for votes that existed." In short, from a careful perusal of the judgments of these two judges who have had the very best possible opportunity of ascertaining what the recent election was worth and what has been the effect of the Ballot Act on purity of voting in England, it is only possible to conclude that the election as an expression of genuine national sentiment was valueless, and that the ballot has, if anything, made matters worse instead of better, as far as purity of election is concerned. The second of these propositions needs no

argument in face of the words of both judges. The first becomes tolerably self-evident when we remember the great preponderance of decisions against the party which the election put into power, and the number of petitions which were hushed up in time to prevent an actual investigation. No one who knows anything about elections is unaware that for every one petition fought to the end there is another withdrawn, and probably three or four which the unsuccessful party are wise enough not to present. It is also sufficiently notorious that, whatever may be the proportion of the public returns, the amount of money actually forthcoming on the winning side at the last election was far larger than that forthcoming on the losing. To draw a general conclusion from these various propositions would be an insult to the intelligence of the reader. As a particular conclusion we may suggest that Mr. CHITTY is an extremely lucky man. He will probably sit for a considerable time without a colleague of any political complexion. But if the inquiry had been made into the first instead of into the second Oxford election, it is far from improbable that there would have been two vacant seats instead of one vacant seat for Oxford.

It is no part of our present purpose to consider the effect which such an expression of judicial opinion as this must have on the authority of the Parliament now sitting at Westminster. We have had plenty of exhibitions of electoral corruption in England, but they have for the most part been individual, not general or combined. The ballot, the "hundreds," and the temporary excess of money at the command of the Radical party, seem—if we may trust Mr. Justice MANISTY, who has had probably better opportunities of judging than any man in England—to have on this occasion worked together in the most harmonious way to provide Mr. GLADSTONE with a majority equally vast and unmanageable. We do not know that this is a party question; and, though the present state of things is certainly awkward for one political party, we shall not treat it as such. Improved organisation, the return of agricultural prosperity, and an increase of caution as to *litera scripta* on the part of University professors who take to electioneering, may at the next election substitute NOKES for STYLES, and a huge Conservative majority for a huge Liberal one. But the question is whether this can be regarded on the whole as a satisfactory prospect. The ballot was to do away with bribery: it has simply, according to the best authorities, complicated bribery with breach of promise. The increase of the constituencies was to render bribery, if not physically impossible, practically useless; and, as a matter of fact, it has simply resulted in the corruption of a great many more persons in a much more offensive way. This, it must be admitted, is not a cheering state of things, and will demand some attention when the Ballot Act comes on next session for serious reconsideration. The old system of borough elections certainly had its faults. But it infected only a small part of the population, and even to those whom it did infect it probably did no very great moral harm. The vast majority of the voters received their bribes as a kind of honorarium or retainer, and would have scorned, save under some very unusual provocation or enticement, to desert their political colours. The newly enfranchised multitudes seem to be sublimely free from any antiquated prejudices of this kind. They are quite untroubled by any foolish feeling of allegiance to blue or buff, and are as much "open to offers" as the ladies who advertise sealskin jackets scarcely worn, and Trichinopoly chains just received as a present from India, in the columns of certain periodicals. If you want their votes you must employ them, and it is by no means certain that if you do employ them, they will not after all vote for the other side either from caprice or for some additional and cunningly conveyed bribe. The evils of this state of things hardly admit of exaggeration. Some fight could be made by an ingenious and audacious advocate for corrupt constituencies of the old type; we cannot see how any can be made for the corrupt constituencies of the new. The sordid instincts of a much larger number of persons are appealed to, and a premium is held out, not merely to cupidity but to shameless falsehood. It was a bad thing, no doubt, that a few score of freemen or scot-and-lot payers should be taught to look on a vote as a marketable commodity. But these persons at least governed their transactions by the ordinary laws of commercial morality, and did not give to B. what they had sold to A. It was a bad thing that the taps of public-houses should be set a-running for the benefit of all and sundry. But the receivers of gratuitous liquor did not at any rate undertake pledges which they immediately proceeded to falsify. For the present condition of things, which seems to be much graver than was supposed before the election, a still further enlargement of the franchise would evidently be no remedy but an aggravation of the evil. The price of watchers or messengers might fall, but the number to be employed would rise. The Election Judges seem to look for a remedy in the absolute prohibition of the employment of paid voters, as agents in the lower description of agencies. We think that a practised electioneerer would see his way to a coach-and-six road through this provision. Voters, for instance, have relations and friends who are non-voters, and a satisfactory understanding can soon be arranged in this way. The truth, discouraging as it may be to some zealous persons, seems to be that with a wide franchise and secret voting, corrupt practices are unavoidable, and if we have pinned our faith to the causes we must take our chance of the effects.

THE EDUCATION ESTIMATES.

IT is an agreeable change to turn from educational controversies to the genuine evidence of educational progress. Amid the disputes which rage round the Fourth Schedule the facts which mark this improvement are easily forgotten. When it is necessary to prove that reading is badly taught, the increasing numbers to whom it is taught, however badly, seem almost unimportant. Yet it is much that more children are sent to school, that there are more schools for them to go to, and more teachers to teach them, that of those who go a larger proportion contrive to satisfy the inspectors in some fashion. The value of these signs of progress may be underrated as well as overrated. What they signify is, that every year a larger percentage of the children who ought to attend elementary schools do attend them; that every year a larger percentage of these children learn something, though they may not learn it as thoroughly as they ought; that the sweep of our educational machinery becomes yearly wider, although many defects in its construction and working still remain to be remedied. These gains were brought out with very great effect by Mr. MUNDELLA in moving the Education Estimates on Monday. To make these Estimates interesting, after all that has been said and written about education for the last ten years, is a very considerable triumph, and it was fairly won by Mr. MUNDELLA. There is no office in which a power of lucid exposition and intelligible arrangement is more valuable than in that of the Vice-President of the Council, and in giving such ample proof of his possession of it Mr. MUNDELLA has thoroughly justified the PRIME MINISTER's choice.

Taking advantage of the fact that this is the tenth year since the passing of the Elementary Education Act, Mr. MUNDELLA showed what the general results of that measure have been. The number of children on the school registers is considerably more than doubled. It was under 1¾ millions in 1870, it is now close upon 3¾ millions. The average number of children in attendance has increased in a still larger proportion. It was under 1¼ millions in 1870, it is over 2⅓ millions now. Mr. MUNDELLA points out, however, that at present the calculations as to average attendance are vitiated by the fact that half-timers are not properly separated from full-timers. The increase of accommodation has been nearly, but not quite, equal to the increase in the average attendance. There was room for something less than 2 million children in 1870, and for something over 4 million now. The rate of grant paid per child shows an increase of 56 per cent. It was nearly 10s. in 1870 and not quite 15s. 6d. now. Something like 20 millions sterling have been spent during the ten years on building, of which about 13 millions have been spent by School Boards. The annual outlay on education, both from rates and the Parliamentary grant, has grown from a little over 1½ millions in 1870 to 4¾ millions. It is satisfactory to find that whatever may have been the disposition of particular School Boards unduly to lower the school fees, they have on the whole increased. In 1870 the yearly average was 8s. 4½d. per scholar, it is now 10s. 5¼d. The proportion of children examined in the Fourth and higher standards rather more than holds its own, which, considering the vast number of untaught

children brought into schools during the last ten years, is perhaps as much as could have been looked for. In 1870 the percentage of children presented in the three higher standards to the total number of children examined was 19 per cent. In 1874, when the full force of the untaught children had been felt, it had fallen to 18 per cent. It has now again risen to 21 per cent. Still, out of the millions of children attending school, less than 400,000 ever get beyond the Third Standard. The average payment per scholar for passing in reading, writing, and arithmetic is within a penny of what it was in 1875, notwithstanding that in this latter year the allowance for a pass in each subject was reduced from 4s. to 3s. In some cases the teaching given in elementary schools has proved an adequate introduction to that given in secondary schools. Out of 72 open scholarships awarded in Manchester Grammar School, 62 have been gained by boys from elementary schools whose parents are artisans. At Sheffield boys from elementary schools are said to ordinarily gain scholarships when Latin does not form part of the examination.

The only instance in which the figures show any falling off is in the average attendance at night schools. In 1870 it was 74,000; in 1879 it was 52,900. This reduction is, however, really encouraging. The curriculum in a night school does not extend beyond reading, writing, and arithmetic, and as these become better taught in the day schools there is less need for maintaining night schools in which to make good shortcomings. Mr. MUNDELLA suggests that the real use of night schools has yet to be discovered. Undoubtedly there must be many children whom attendance at a good night school would enable to carry on their education for some years beyond the age at which they now end it. By this means the limit of the school age would be really, though not nominally, increased. The child who left school at twelve might, by good use of his evenings, gain in the course of the next four years at least as much as he would have gained by remaining another year at a day school. No doubt, before this could be done on anything like a comprehensive scale, it would have to be decided to what extent the State ought to pay for secondary education. Night schools are a part of the machinery of elementary education, so long as they are directed to filling up the gaps left by accident or neglect in the work which ought to be done by elementary schools. But, as soon as they attempt to carry on the work done by elementary schools, they really become a part of secondary education. They help to give to special children something more than is given to ordinary children—something which shall benefit the cleverer or the more industrious child, and help it to know something more than its fellows. Whether it is well for the State to take this function upon itself is a question that cannot be decided merely with reference to night schools. If there is good reason for teaching children between twelve and sixteen at night, there is equally good reason for teaching children between twelve and sixteen by day, unless the instruction given at night is merely intended to supply what ought to have been given before the child left school and went to work. We are not anxious, therefore, to see Mr. MUNDELLA's suggestion, that the teaching in night schools should be improved and made more comprehensive, immediately adopted. For their original purpose night schools are happily becoming less and less necessary. For any larger purpose they ought not to be subsidized, except as a part of a comprehensive scheme of secondary education.

It is not necessary to say anything on this occasion on the demerits of the Fourth Schedule. There was so much in Mr. MUNDELLA's speech with which every one who desires the extension of education must heartily agree, that we are not anxious to touch upon any ground of difference. All parties may share in the satisfaction to which the figures just given are calculated to give rise. They may not all take the same view of the uses to which this vast machinery may be most profitably turned, or of the proportion in which the outlay which it entails should be distributed. But as regards the gain both in the present and in the future which the existence of such a machinery constitutes, there cannot be two opinions. Mr. MUNDELLA's statements show that where one child was at school ten years ago two are at school now, that the attendance of the children is more regular, that a larger proportion of them satisfy the Inspectors in the standards in which they are presented, and are presented in the higher standards. All this shows what has been done by compulsion, while at the same time it suggests a hope that in time compulsion may, in the best sense of the phrase, become a dead letter. The more universal elementary education becomes the more plainly it will be the interest of the parent not to allow his children to be worse equipped than others, and the less temptation he will be under to keep them away from school. Considering how much has already been accomplished in this direction, it has really been accomplished with wonderfully little friction.

MONT BLANC FORTY YEARS AGO.

"THE ascent of the highest mountain in Europe long passed for a mountaineering exploit of the first order, deserving of special record, and admitting, on the part of those who achieved it, of a style of high-flown description which gave a formidable idea of the difficulty of the performance. Such descriptions represented, for the most part in good faith, the impression made upon the minds of travellers by phenomena new and imposing from the grand scale on which they operate, very much heightened by ignorance of their laws, which left the imagination subject to an ill-defined sense of wonder and terror."

So we read in the authoritative pages of Mr. Ball's Guide to the Western Alps; but the truth of his words is not fully realized until it is one's fortune to come across the specific record of some comparatively early ascent. There lies before us a thin octavo, entitled "Ascent to the Summit of Mont Blanc, on the 22d and 23d of August, 1837," privately printed in 1838, and adorned with lithographs containing weird and archaic representations of rock and snow scenery, and further elucidating the interesting details given by the text of the mountaineering costume of the period. These bear the writer's initials and are presumably from sketches furnished by him. After the lapse of more than forty years the little book may fairly be considered *publici juris*; this copy, at all events, has passed through the public book-market; and it may be presumed that no one concerned is now living. The narrator himself died many years ago, as appears by a notice inserted in the end of the book. He was a youth of nineteen at the time of his adventure, which made the number of ascents thus far accomplished equal to that of his years. It does not appear that he had any previous experience of mountain work; on the other hand, there is no reason to suppose that he was inferior in bodily strength, activity, or nerve, to other healthy English youths of the same age, or (to speak more particularly) to the average of the many English undergraduates who at this day regard an ascent of Mont Blanc as nothing to be greatly proud of or at all afraid of. Indeed he must have been a pretty vigorous walker, for he trudged with a knapsack from St. Martin to Chamounix, most of the time after dark, and guiding four French tourists. His name was Henry Martin Atkins, and he was afterwards a lieutenant in the 53rd regiment; his tale is told in the form of a letter, and was printed, it seems, rather against his will. He begins with an apology, the material part of which is thus expressed:—"I am perfectly conscious that I am to blame, as I know it is wrong to risk life, as I have done, when it can be well avoided; and I am now well aware that the unwise reason why I attempted the ascent was that I thought it of its kind the most difficult and dangerous exploit to perform in Europe." At first he meant only to go half way up, but, falling in with another English traveller and a Swedish officer, who were undertaking the whole ascent, he joined their party. The first curious particular we learn is that in those days the guides engaged for Mont Blanc used to beg for a clear day before the expedition to pass with their families. No doubt even the guides took it more solemnly then than they do now; but one cannot help suspecting that there was a touch of policy in this, when one finds at the end that the leading guide received one hundred francs from each traveller, and the others forty, besides an unspecified further dividend; to be sure, it is added that "they were all very thankful." Several travellers expressed to Mr. Atkins their surprise that he should make the attempt, "never having ascended a mountain before, and not knowing what a glacier was to walk upon." And one cannot say that they were wrong; for though many persons have since made the ascent with no more knowledge of "what a glacier was to walk upon" than Mr. Atkins had, the expedition can hardly be considered a very profitable or enjoyable one under those conditions.

The column of attack which left Chamounix at four o'clock on that August morning of 1837 consisted of three travellers, ten guides, six porters, and "five or six volunteer peasants"; that is, on a liberal computation, about four times as many persons, combatant and non-combatant, as would be thought desirable nowadays by the most prudent. Modern practice has discovered that for Alpine work there is no additional safety in numbers beyond four or five, but only delay and hindrance. The march as far as the Pierre à l'Échelle is described with no more than ordinary exaggeration; it is remarkable, however, that there is no mention of the risk of falling stones at one or two points, which, being unavoidable as far as it goes, is more serious in kind than anything to be met with higher up. A quite recent school of climbers which rather makes light of falling stones was anticipated by the blissful ignorance of the early Mont Blanc period. It was supposed that the whole thing was fearfully dangerous, and (on the erroneous assumption of all infinites being equal) that one danger was much the same as another.

On entering "the dangerous passage of the Glacier des Bossons" there was a solemn leave-taking with the porters. We read that the Mer de Glace is nothing to the Glacier des Bossons for either beauty or perils, and that the party often found themselves on places where there was "on both sides a tremendous crevasse." The lithograph on the opposite page shows the expedition (seventeen men and a dog) threading its way among masses of something that looks like very shaky *blanc-mange* moulded into fantastic peaks and points; one of the travellers is crossing a huge crevasse by means of the ladder. All this while nobody thought of using the rope until Mr. Atkins's foothold gave way in jumping one of the smaller crevasses, and one of the guides caught him by the collar; then indeed he was "joined by a cord, and kept hold of the hand of one of the guides." To whom or what the joining was effected is not stated; not improbably to only one guide, who may or may not have made his own end properly fast. If this was the way in which guides with inexperienced travellers did their work in the year 1837, it was just as well for the travellers that there were not many of them. At length the party "arrived at the foot of the rocks called the Grands Mulets," which are described as "about 300 feet high, and nearly perpendicular." And so they must have been in 1837, for there is their picture to testify it; they appear about as steep and sharp as an average cathedral spire, and are arranged in parallel ledges just wide enough to stand on, like the mountain of Purgatory in the woodcuts illustrating certain early editions of Dante. There was a terrific couloir to be crossed before the sleeping-place was gained, "a wall of ice, like a frozen waterfall between two rocks." And so "we were more than 9,300 feet above the level of the sea, and it is here that most travellers are contented and return home"; and, as Mr. Atkins adds in a note, "there was something sublime in standing there amid the silence of the night, and to feel that we were at that moment the most loftily situated individuals in Europe."

It is certain, however, that a night at the Grands Mulets forty years ago involved hardships unknown to later travellers; for there was in those days no manner of hut, and all the guides could do was to rig up an imperfect shelter-tent. Also the salt had been forgotten, which if a leading guide were to suffer now he would consider himself in grievous default. Here they saw many avalanches, and thought they "ran the risk of being crushed by the loose rocks above" them. They found it very cold all night and the next morning, though the narrator had not omitted precautions against frost. He describes his clothing as follows:—"I had on a good pair of lamb's wool stockings, two pairs of gaiters, two pairs of cloth trousers, two shirts, two waistcoats, a shooting coat, and, over all, a blue woollen smock-frock, a night-cap, three handkerchiefs round my neck, two pairs of woollen gloves, and a straw hat from which hung a green hood. For my eyes a pair of spectacles, and a green gauze veil." In some points of dress Mr. Atkins appears to have been the sole rational being among the party. The sketches show most of them in tail-coats, tight trousers, and chimney-pot hats. And the "blue woollen smock frock"—we presume such a one as is worn by fishermen on our coasts—is really worth considering as an alternative to the more common plaid; it has the same merits of combining lightness and warmth, and the peculiar one of leaving the limbs perfectly free without any fastening or adjusting. On the other hand, it would be of little or no use in ordinary travelling. The green veil—to our mind an absolutely vain thing—continues to be worn by some to this day. We may conclude, on the whole, that in the matter of passive resistance to Alpine cold the present age is not very degenerate; but to walk, much more climb, under the burden of clothes counted up by Mr. Atkins is a feat to which we fear it must confess itself unequal.

On the entry to the higher snow region we hear of one guide who "went in advance, with a cord tied round his waist, in case of accident," but nothing of the party as a whole being roped. In other words, the expedition was made really dangerous by neglect of what every guide now knows to be an elementary precaution. As for the travellers, they evidently had no opinion on the matter. The Grand Plateau is described as "an immense level plain of snow, surrounded by formidable mountains of ice"; on the latter part of the way across it there was a halt for breakfast, consisting of "frozen fowls, frozen wine, and frozen bread, all of which seemed delicious, though" the party "could hardly gnaw them." It is credible that the solid provisions had been frozen by being left out all night; but the frozen wine is nearly as hard for posterity to swallow as it is stated to have been for the travellers. On leaving the Plateau "the difficulties and dangers were very great. We had to wind along the side of a very steep declivity, at the bottom of which opened a tremendous gulf, into which a single false step would have precipitated us; and at the same time we were in dread of avalanches falling on us from above. We spoke very little, the guides telling us that they were likely to fall at the sound of the human voice." It is also stated that an avalanche did afterwards cross the track of the party somewhere hereabouts; and this, be it remembered, late in August. The readiest explanation would be to suppose that the route by the *ancien passage* was taken; but this is not admissible, as it had then been abandoned for several years, and the ascent of the Mur de la Côte is expressly mentioned on the same page. What was seen ("it appeared about the size of a large hayrick") was more probably a fall of *séracs* than an avalanche. It would seem that the guides all went first, and let the travellers follow as best they might; a procedure not exactly approved by modern usage. Indeed, it is stated in one of the notes that "in an expedition like this it was 'every man for himself'; and therefore we saw very little of each other, excepting at the halting places." At last the party reached the summit, in eight hours from the Grands Mulets—about the time assigned by modern guide-books. Apparently they were by this time incapable of doing anything but lie down and go to sleep just where they stopped. After half an hour or so they recovered and began to look about. Over the plains of Lombardy they perceived a sort of vapour, which they concluded was the Adriatic; "and as Venice was the nearest point, if we saw the one we might the other"; anyhow, the guides said they did. But they were satisfied, then or afterwards, by consideration of the map, that it was not in the nature of things that they should see the Gulf of Genoa. How long the guides may have succeeded in keeping up the legend of seeing Venice we do not know; it is now dead and buried. An imposing catalogue of peaks and valleys is given, but a note confesses that fatigue, cold, and the sense of danger prevented the adventurers from enjoying the view as they should have done. As they were starting for the descent, a breeze sprang up, and carried Mr. Atkins's hat down the Italian side, whereby he nearly lost his senses, but made shift to go on by tying five handkerchiefs round his head. The manner of the descent was singular, and is thus related:—"The descent is in some parts more dangerous than the ascent, from the liability to slip down the steep hills of snow. I had a cord round my waist, and was held back by two guides, while another took hold of my arm." It seems to have been an open question whether they should not camp out again on the Grands Mulets, till it was found that there was in fact time enough to get down to Chamounix the same day. On approaching the village, Mr. Atkins was met by a messenger from his host, who had sent the best mule of the inn; and so he rode into Chamounix in a sort of triumph, surrounded by English tourists and inhabitants, and enduring much hand-shaking, as "being the youngest traveller who had ever reached the summit." He was laid up for nearly a week with sheer muscular exhaustion, and notwithstanding the veil and spectacles, lost all the skin of his face. This being the effect of the expedition on his person, it was but natural that his final conclusion should be "that no one should attempt the ascent to the summit of Mont Blanc unless induced to it by some object connected with science." In later years many men little older, and several younger than Mr. Atkins was in 1837, have achieved this ascent with much less pomp and ceremony, and with no ill effects of any kind, except indeed as to the skin, whereof every climber must pay toll to this day unless he can manage to harden his face by a very gradual and wary process of insolation. As for the moral of the story, it is a very simple one. Mr. Atkins was, for all that appears, in no way a feebler man than other young men; yet the ascent seemed to him, and, considering how it was conducted, no doubt was, a matter of exceeding hardship and peril. In the last twenty years Alpine climbing has become an art with well-settled rules, and the observance of those rules has immensely diminished its risks. Not only have ascents been made far less troublesome by the increase of mountain inns and sleeping-huts, but the most daring expeditions of our own time are really far more prudent than those of the earlier days, by reason of the necessary precautions being understood. The present season, unhappily, has been strangely fertile of Alpine disasters; the facts, so far as ascertained, seem to point to an exceptionally treacherous condition of the higher snows. It must be admitted that a margin of unexpected and unavoidable danger exists, but it is not the less true that modern climbers have reduced it within comparatively small bounds. The present generation of guides do not beg to spend the day with their families before undertaking to lead the way up Mont Blanc or Monte Rosa; but then they are not content simply to take their chance of falling stones and avalanches, nor do they wait to put on the rope till somebody has nearly gone down a crevasse.

SPEECHES AND PRINCIPLES.

In the remarkable debate which occupied the House of Lords in the early part of the present week the balance of the votes hardly exceeded, one-sided as it was, the balance of the argument. In such a case, however brilliant they may be in themselves, the speeches on the winning side lose a great deal of their brilliancy. The essence of debate is that there should be something like fighting, and a state of things expressed by the stock quotation, "Ubi tu pulsas ego vapulo," is not favourable to the display of the scientific capacities of the striker. Not one single speaker on Monday or Tuesday night can be said to have broken a lance fully and fairly in favour of the unlucky Bill. Lord Granville hinted amiably that it would be very nice if the Lords would oblige the Government by putting their convictions in their pockets and voting for a measure which they knew to be unjust and inexpedient. Lord Emly abused the Bill heartily, and then said he was going to support it. The Lord Chancellor confined himself to the endeavour, not very successful, to meet a few of the arguments of Lord Cairns's masterly speech. The Duke of Argyll was chiefly occupied in a personal explanation of the curious fact that he, a champion of contract, found himself voting for its infringement. It is difficult to plant effective hits on adversaries who do nothing but feint and give ground. Yet in the cluster of addresses delivered against this unhappy abortion of

Mr. Forster's, and in one most remarkable speech on the other side, not a few points of interest were to be found of a character transcending the interest attaching to speeches which merely give the *coup de grâce* to a measure already given over by its friends and its physicians. As yet it is, fortunately or unfortunately, useless to look in the House of Lords for an exponent of Radicalism pure and simple. The "intellectual and persevering party," of whom Lord Beaconsfield spoke perhaps with unnecessary compliment—for as Radicalism grows older it certainly does not show signs of increase in intellectual brilliancy—was not represented in the debate, and it is rather curious that even in the House of Commons, where this party has plenty of spokesmen, this particular Bill does not seem to have evoked any warm championship from its members. But in the speeches of Lord Derby on one side of the House, and of Lord Salisbury and Lord Beaconsfield on the other, the two most vigorous and prominent kinds of political opinion which divide with Radicalism the region of political thought in England received noteworthy expression. Lord Derby's speech, while exhibiting in the most curious way the idosyncrasy of Lord Derby himself, exhibited also to a great extent the kind of thought which, existing in persons of no very defined political principles, has a larger influence perhaps in England than in any other country. Lord Beaconsfield and Lord Salisbury represented with remarkable success and vigour the opposite tendency which, at any rate under present circumstances, seems to us, we must confess, that on which the *salus reipublicæ* must principally rely.

The speech of Lord Derby might be summed up, with hardly a trace of unfairness, in these words:—"The Bill is unnecessary, inexpedient, and unjust. I shall vote for the Bill." One after another, every argument which has been brought against this much discussed proposal was stated and endorsed by Lord Derby in the clearest language. It had the appearance, if not the reality, of a concession to the Nationalist party in Ireland. It had to be taken in conjunction with the fact (denied by Lord Hartington and the Irish Attorney-General, but notorious to all the world beside) that the Irish peasant regards rent-paying with abhorrence and the landlord as a kind of enemy of the human race. It covered an unreasonable amount of ground. It lasted for an unreasonable time. It put the landlord in a position of unreasonable inequality as regards the other creditors. It aggravated the position of the very class it was meant to benefit. It pointed unmistakably to still farther concessions to the land agitation. It instituted as judge an official who would find it impossible to come to a decision. Therefore Lord Derby would vote for the Bill with the intention of drawing its teeth in Committee. In other words, Lord Derby saw all the objections to the measure, but declined the responsibility of rejecting it. It is seldom that a state of mind of this sort gets itself avowed in clear and unadorned language by the person who is suffering from it. But it is certain that it is a state of mind which prevails to an immense extent in England, and which has had a great deal to do with the success of innumerable reforms—some of them very beneficial, some of them very unnecessary, some of them positively injurious. "Give me money and men and I will stump England into assenting to the proposition that two and two make five," said a political student. The possibility of the operation depends entirely on the existence of men like Lord Derby, though of course with Lord Derby's characteristics present in them in a less eminent degree. Such men are always possessed of a nervous fear of resisting innovation and public opinion. Their common sense, their education, their position, their interests, show them indisputably that two and two do not make five. But the agitator is not in the least daunted by this. He produces evidence to show that a certain number of persons are actually aggrieved by the present view of arithmetic, that, in pursuance of their feeling of aggrievement, they have killed a policeman, blown up a jail, resisted the service of processes, or what not. He hints, if he is in a position to do so, that he will not be responsible for the maintenance of public order if some concession is not made on the point. He threatens to denounce, and does denounce, the class feeling and the abuse of privilege which maintain the obsolete opinion that two and two make four. And little by little the Lord Derbys and their million representatives give way. At first they attempt a compromise, and, like Lord Derby in this instance, suggest that two and two shall be considered equal to four and a half. The agitator, emboldened by this sign of weakness, redoubles his efforts; more policemen are killed, more jails blown up, and the "measurable distance" of civil war becomes apparently less. So at last weak-kneed common sense gives way. It is solemnly pronounced that two and two do make five, and thenceforward any one who goes back upon the older proposition is treated as a lunatic reactionist. Probably the new enactment does not actually send the country to the pit of Acheron—it takes a good deal to do that. Then the advocates of five triumph over the few remaining advocates of four, and say, "See how rich England is, see how prosperous. It is all the consequence of the immortal legislation which declare that two and two make five."

The opposite course to this was, as we have said, excellently put in the debate by Lord Salisbury and by Lord Beaconsfield. The motto which Lord Salisbury proposed for the acceptance of the House of Lords—"Be just, and fear not"—was particularly appropriate, because of the attempts which have been made to represent the measure as one of justice to Ireland. That it is in reality one of injustice to Irish landlords, and especially to the smaller and poorer landlords, is sufficiently obvious to all who choose to see. It is by no means such proprietors as Lord Lansdowne—who has courageously taken the right side irrespective of the calls of ambition and friendship—that have most to suffer. They have other property to carry them through the evil times, and the dead certainty of a failure to pay the arrears at the end of the period stipulated by the operation of the Bill, secures them an opportunity of getting rid at last of a mob of thankless and profitless cumberers of their land. It is the unfortunate small owners whose cause the Lords really fought on Wednesday morning. To this general reminder of the duty of upholding justice Lord Beaconsfield's criticism of the opposite argument was a peculiarly useful addition. "There is," said the late Premier, "at the present day too great a tendency to believe that it is impossible to resist the progress of a new idea." There is this tendency, beyond all doubt; it is embodied in the conduct of Lord Derby and his likes; and it is ample time that it should be met. No one, we suppose, even among his most unscrupulous detractors, will accuse Lord Beaconsfield of being afraid of ideas simply because they are new. He is certainly as little troubled with superstitious devotion to the existing simply because it exists as the most lively Radical who "thinks himself a philosopher because he doesn't believe in the Devil." But next to the folly which refuses to abandon an old thing simply because it is old, may certainly be ranked the folly which eagerly grasps at a new thing simply because it is new. In politics indeed the latter absurdity does more harm than the former. For the old thing has at least shown its capacity for life by actually living for some considerable time, while no one can tell whether the new one is *né viable* or not. But, so long as the fetich-worship of progress exists, it is difficult to see how legislation and the government of the country are to be anything more than a series of crude experiments. The harm which these experiments do may be less or more according to circumstances. Even Mr. Dodson's Bill for the Encouragement of Small-pox may be comparatively harmless if reasonable people do their utmost to meet it by encouraging vaccination. The world is not wholly composed of fools and scoundrels, and without the more or less active co-operation of fools and scoundrels even the worst legislation can do but a limited amount of harm. But it scarcely requires argument to show that the haphazard passing of bad laws on the strength of the conviction that they will not practically do much harm is, to say the least, an eccentric method of proceeding. This is what the action of the good persons whom we have classed with Lord Derby practically amounts to. They are afraid of refusing to accept the new ideas, and they hope the new ideas will not do them much harm after all. Consequently they are at the mercy of the first agitator with a plausible tongue and a good fund of energy who sets to work to upset things in general. The antidote to this is, of course, not indiscriminate resistance to all change, but the proving of all the changes proposed, and the steadfast refusal to accept them simply because they are changes, and because public opinion or public sentiment is supposed to be in their favour. No one has yet been successful in defining exactly what is to be taken as an expression of public opinion, and everybody who has looked into the subject must have convinced himself pretty clearly that this opinion is for the most part no opinion at all. It is partly hearsay, partly misapprehension, and partly the nervous fear which prevents the Lord Derbys from following the dictates of their own common sense, their own knowledge of history, and their own personal experience. Against this public opinion, composed of heterogeneous elements, and bound together by no firm tie, there is no better solvent than that of a vigorous and healthy scepticism as to new ideas. Practically the Radical who believes that everything that is ought not to be is at least as unreasonable a creature as the Tory (if there be any such) who believes that everything that ought to be is; and, having no little conceit of himself, he is even a more hopeless subject for conversion. But the floating mass of Lord Derby's likes are not quite in such a desperate case, whatever may be the fact as to the distinguished type. "Be just and fear not," with "Don't be afraid to disbelieve in new ideas" as a rider, makes up at the present moment a very convenient portable code of politics for practical politicians who desire to keep their country out of harm's way.

LORD MACAULAY AND THE *PILGRIM'S PROGRESS.*

A PASSAGE in Macaulay's Essay on the *Pilgrim's Progress* has led us to examine with some little care the estimation in which Bunyan was held in the last century. Macaulay writes:—"Cowper said, forty or fifty years ago, that he dared not name John Bunyan in his verse, for fear of moving a sneer. To our refined forefathers, we suppose, Lord Roscommon's Essay on Translated Verse, and the Duke of Buckinghamshire's Essay on Poetry, appeared to be compositions infinitely superior to the allegory of the preaching tinker." In the Life of Bunyan, published in the *Encyclopædia Britannica*, Macaulay says:—"Young coupled his prose with the poetry of the wretched D'Urfey. In the 'Spiritual Quixote,' the adventures of Christian are ranked with those of Jack the Giant-killer and John Hick-a-thrift." He goes on to point out that the *Pilgrim's Progress* was perhaps the one exception to the rule that "when the educated minority and the common people differ about the merits of a book, the opinion of the educated minority finally prevails." The passage

in Cowper certainly seems at first sight to prove that less than one hundred years ago Bunyan's name was a name of scorn. The poet says:—

> I name thee not, lest so despised a name
> Should move a sneer at thy deserved fame,
> Yet ev'n in transitory life's late day,
> That mingles all my brown with sober gray,
> Revere the man, whose Pilgrim marks the road
> And guides the Progress of the soul to God.

In like manner, he had not ventured to bring Whitfield into his verse:—

> Leuconomous (beneath well-sounding Greek)
> I slur a name a poet must not speak.

In such a case as this, however, Cowper's evidence must be carefully weighed. It certainly must not be taken for gospel. On matters that touched on religion he was, as every one knows, morbid, and no less on matters that touched on the world. We should be scarcely justified in drawing the conclusion that the use of the Lord's Prayer by the clergy was a hundred years ago confined to church hours, because Cowper, a few lines before he mentions the *Pilgrim's Progress*, tell how the horn-book

> Presents the prayer the Saviour deigned to teach,
> Which children use, and parsons—when they preach.

The *Tirocinium*, in which these lines are found, is a satire, and a satire is not history. Again, the passage from the Spiritual Quixote has not the force that Macaulay would wish to give it. He has, we believe, as was not uncommon with him, quoted from memory, and his memory, powerful though it was, has played him false. The passage to which he refers is, no doubt, the following:—"Pray, Madam," continues Wildgoose, "did you ever read the *Pilgrim's Progress?*" "Ha! ha! ha!" cries Rueful in a horse-laugh; "I believe we may all have read that, and 'Jack the Giant-Killer' too in the nursery." Now Beau Rueful was the last man whose authority should be quoted on a point of literature. He was one who, "with the help of a convenient assurance and a laced-coat, had wriggled himself into tolerable company; and what is more strange, by boldly criticizing every new pamphlet, laughing at everything serious, and by putting modest people out of countenance, was by some people esteemed a formidable wit." Wildgoose answered his sneer at the *Pilgrim's Progress* by saying, "Well, sir, you may laugh; I now only mention that original author upon a ludicrous occasion, as I think his account of 'Vanity Fair' seems to be no bad description of the insipid intercourse that usually passes between the thoughtless creatures at most of those public assemblies." The authority of the Spiritual Quixote might be brought forward just as well against Tillotson and the author of the *Whole Duty of Man* as against Bunyan. "Why," said Wildgoose on another occasion, "you might as well have read the 'Seven Champions' or 'Jack the Giant-Killer' as either the *Whole Duty of Man* or Tillotson, who knew no more of Christianity than Mahomet." The authority, indeed, of Young still remains, and to Young might have been added an authority of far greater weight—that of Addison. In the *Whig-Examiner* he writes, "I never yet knew an author that had not his admirers. Bunyan and Quarles have passed through several editions, and please as many readers as Dryden and Tillotson." Mrs. Montagu, following likely enough Addison—for she was great at imitation—also joins Quarles's *Emblems* and the *Pilgrim's Progress*. These two books, she says, with *Æsop's Fables* and Joe Miller's *Jests*, form the particular entertainment of her neighbours the Kentish squires. In another passage she calls Bunyan and Quarles "those classics of the artificers in leather."

On the other hand, it is not difficult to quote passages in which Bunyan is mentioned either with honour or at all events with no want of respect. First of all we have Johnson's great authority. "Was there ever yet," he asked, "anything written by mere man that was wished longer by its readers, excepting *Don Quixote, Robinson Crusoe*, and the *Pilgrim's Progress?*" Few of our readers will have forgotten how "he one day took Dean Percy's little daughter upon his knee, and asked her what she thought of *Pilgrim's Progress*. The child answered that she had not read it. 'No,' replied the Doctor; 'then I would not give one farthing for you,' and he set her down and took no further notice of her." Eleven years before Cowper published his *Tirocinium*, Johnson, after praising the *Pilgrim's Progress* for its invention, imagination, and the conduct of the story, added, "It has had the best evidence of its merit—the general and continued approbation of mankind." It was at the table of a man of wit and fashion that he said this, at which were dining many of the members of the Literary Club. Boswell does not record any expression of dissent or surprise on the part of the other guests, such as we might have with some reason looked for if we were to trust Cowper's lines. Madame Piozzi, writing four or five years later than Cowper, after saying that Correggio was perhaps one of the most powerful geniuses that has appeared on earth—a man who has left glorious proofs of what uninstructed man may do—adds, "The *Fatal Curiosity* and *Pilgrim's Progress* will live as long as the *Prince of Abyssinia* or *Les Avantures de Telemaque* (*sic*) perhaps; and who shall dare say that Lillo, Bunyan, and Antonio Correggio were not *naturally* equal to Johnson, Michael Angelo, and the Archbishop of Cambray?" The learned Mrs. Carter, writing in the year 1744 to the scarcely less learned Miss Talbot, the constant inmate of Archbishop Secker's house, compares some of her companions to Christian climbing up the Hill Difficulty till at length they quite sink into the Slough of Despond. "Have you ever read *Pilgrim's Progress?*" she adds. Hawkins, Johnson's companion and biographer, in describing the translation of *Lobo's Voyage to Abyssinia*, says, "It has scarce a feature resembling Johnson; the language is as simple and unornamented as John Bunyan's." Certainly, though Hawkins was, we should suppose, the last man who could enjoy a work of imagination, yet there is in this no contempt to be discovered of the *Pilgrim's Progress*. Chesterfield, in one of his letters to his son, writes:—"Some people read history, as others read the *Pilgrim's Progress;* giving equal attention to, and indiscriminately loading their memories with every part alike." Neither in the polite Chesterfield is there to be discovered either ignorance or contempt of Bunyan. The poet Mason, writing to Horace Walpole, says, "I have had no occurrence in my progress or pilgrimage through this valley of life (to speak in the style of John Bunyan), &c." Some years later Horace Walpole, writing to Mason, makes a vigorous attack on epic poetry, which is, he maintains, "the art of being as long as possible in telling an uninteresting story." He goes on to say that "Ariosto was a more agreeable Amadis de Gaul, and Spenser, John Bunyan in rhyme." It may be questioned whether he despised Bunyan more than he did Spenser. If he did, it was, we may with good reason suppose, for an excess of those qualities which are to be found in both writers.

In at least two passages in the *Gentleman's Magazine* Bunyan's great powers are acknowledged. In the year 1765 a writer describes it as a work of "original and uncommon genius. . . . Curiosity is forcibly raised, and constantly gratified; the mind is ardently and tenderly interested for the hero, his dangers produce surprise and terror, and his escapes admiration and joy." Twenty-four years earlier, in the volume for 1741, another writer says:—"There never was an allegory better designed, or better supported. The Wits may perhaps take offence at the respect I pay to this religious romance; but if we consider the universal good reception it hath met with at home and abroad, we must either allow that it has merit, or that ourselves and our neighbours are void of penetration and true judgment." Other allegories, he says, "have been written by learned and judicious men, yet these have met with an indifferent reception compared with that afforded to the *Pilgrim's Progress* of Bunyan." Macaulay, in one of his eloquent sentences, launches forth into praises of Bunyan's style. "We have observed," he says, "several pages which do not contain a single word of more than two syllables. Yet no writer has said more exactly what he meant to say." And then Macaulay, breaking away from "the vocabulary of the common people," the homely tongue which he values so highly, uses in its praise, in less than five lines, "magnificence," "pathos," "vehement exhortation," "subtle disquisition," "dialect," "perfectly," and "sufficient." We do not know whether the old writer in the *Gentleman's Magazine* does not hit it off better when, after saying that "Bunyan's example might incline men unacquainted with any but their mother-tongue to undertake somewhat therein," he adds, "Sense is sense in all languages, and let a man know ever so much Latin and Greek, he thinks in the tongue of his people, let it be what it will." But to return to the old authors who mention Bunyan, of whom we have still two left, Hearne the antiquary, Tory and High Churchman though he was, records in 1723 how his friend Mr. Bagford (some time before he died) had "walked once into the country on purpose to see the study of John Bunyan. When he came, John received him very civilly and courteously, but his study consisted only of a Bible and a parcel of books (the *Pilgrim's Progress* chiefly) written by himself, all lying on a shelf or shelves." Mr. Bagford was that ardent lover of books who "contributed much to the advancement of learning by preserving from destruction many of the most valuable relicks of early literature now extant." Our last quotation shall be from Swift. In his "Letter to a Young Clergyman," he attacks those "gentlemen who, abounding in their university erudition, are apt to fill their sermons with philosophical terms. . . . I have been better entertained," he adds, "and more informed by a few pages in the *Pilgrim's Progress* than by a long discourse upon the will and the intellect, and simple or complex ideas." Swift's authority may be well opposed to Addison's.

A more extensive reading than that of which we can boast would no doubt throw still more light on the place which Bunyan held with the educated minority of last century. We have, we trust, succeeded in proving that Macaulay gave too much weight to the evidence of a religious recluse like Cowper and a worldly satirist like Young.

DEAN STANLEY ON EARLY CHRISTIAN BELIEF.

DEAN STANLEY is not only one of the most ingenious and picturesque, but also one of the most surprising of writers in the sense that he is constantly engaged—whether intentionally or not—in preparing surprises for his readers. It may be said with truth indeed that we always know what to expect from him, inasmuch as there is a particular way of looking at things, which may roughly be described as Broad Churchism, but which is so distinctive a phase of Broad Churchism, that it is difficult to call it by any other name than Stanleyan, and this view invariably reappears, in some shape or other, in everything the Dean writes. But it is equally true to say that we never know what to expect, for the process by which the apparently simple thesis announced from time to time is destined to pass under his transforming touch into its new significance, the connecting link to be forged between the

familiar dream and the Stanleyan interpretation thereof, can hardly fail to elude the prescience of the most practised of the Dean's readers, and is always, when it comes to light, a fresh surprise. It is not so very long since we had occasion to notice his characteristically *à priori* treatment of "the Variations of Catholicism," designed as a rejoinder to Bossuet, in *Fraser's Magazine*. But even that had by no means prepared us for his manner of dealing with "the Creed of the Early Christians" in the *Nineteenth Century*. Dean Stanley was formerly Professor of Ecclesiastical History at Oxford; he has published three historical volumes on the Jewish and one on the Eastern Church. And on seeing the title of his last article we presumed that he had given us an historical sketch, or what was intended for such—largely coloured of course by his own mental idiosyncracies—of the religious belief of the early Church. That it would be a very accurate sketch we did not venture to anticipate; and remembering his description of the Council of Nicæa, in which the persons, and even the dresses, of the assembled prelates, and the various local incidents and surroundings of the Council occupy a more prominent place than the doctrines it assembled to discuss, we fully expected to find the theological element subordinated to the æsthetic or picturesque. But for what we actually found we were not prepared. It gradually dawned on us, as we began to read, that by the Creed of the Early Christians the author meant what are commonly called the three Creeds, especially the Apostles' and the Nicene, and that his object was to give us an exposition of these Creeds, or rather of the "sacred names" which supply their keynote, not according to the belief of the early Christians—that is hardly pretended—but according to his own. He does indeed speak in one sentence of what these names "represented in the minds of the early Christians," but he at once proceeds to inquire what is their meaning "in the Bible," that is of course as he understands it, and the rest of the paper is an answer to that inquiry. This was a little startling, but as we read on we were first perplexed, and then rather amused, to find that the versatile Dean had achieved the seemingly impossible task of expounding the leading ideas of the Apostolic and Nicene Creeds with hardly a passing reference to any of the theological doctrines supposed to be enunciated in them, which formed the subject of prolonged and ardent controversy during the first seven or eight Christian centuries and were debated at the seven general and a host of local and provincial Councils both in East and West. It became clear to us at once that any interpretation of the Creeds conducted on this principle, whatever might be thought of its Biblical merits, could hardly be considered an historical one.

But before saying more of the Dean's estimate of the creeds, we have seriously to demur to one of his prefatory observations, which, according to his wont in such cases, is not less dogmatic than inexact:—

> It is observable, before proceeding further, that the Creed, whether in its Eastern or its Western form, leaves out of view altogether such questions as the necessity of Episcopal succession, the origin and use of the Sacraments, the honour due to the Virgin Mary, the doctrine of Substitution, the doctrine of Predestination, the doctrine of Justification, the doctrine of the Pope's authority. These may be important and valuable, but they *are not in any sense part of the belief of the early Christians.*

That the somewhat heterogeneous collection of opinions which are here unequally yoked together was held in its entirety by the early Christians, or by any other body of Christians, no tolerably informed writer would dream of maintaining, but to say that none of these matters entered into the early Christian belief would be a hardly less gratuitous assertion—not to use a stronger term—and it betrays a fundamental misapprehension to suppose that no doctrine, which does not occur in so many words in the Apostles' Creed, could have formed "*in any sense* part of the belief of the early Christians." As Milman put it, "the simpler Apostolic Creed, and the splendid amplifications of the divine attributes of the Trinity" in the Nicene, were enlarged from a very early date, "if not by stern definitions"—those came later, as successive heresies elicited them—by universally received axioms on several other points of doctrine, though it is quite true that neither *e.g.* the doctrines of Substitution nor of Papal Supremacy were among them. The creeds were drawn up as a catechetical summary of elementary *credenda* required to be taught candidates for baptism rather than as covering the whole ground of contemporary belief even on what were deemed important or essential points. The special curiosity, however, of the article lies in the Dean's exposition of the Apostles' Creed. That this formulary might be treated historically as well as doctrinally we fully admit. It has been argued very plausibly that the course of Christian theology has followed in the main the order of the Creed, dealing successively with questions concerning the three Persons named in it, or suggested by its three successive parts, the subjective or, as it is sometimes termed, the anthropological side of theological speculation coming under the third part, where questions about the Church, sacraments, justification, and the like, most naturally present themselves. And a work taking the shape of what the Germans call *Dogmengeschichte*, as distinguished from *Dogmatik*, and tracing out this aspect of doctrinal evolution would be a very interesting one. But that is not what Dean Stanley gives us here. He is as little historical as doctrinal. What he has to tell us is what would for the most part be admitted by every class of Christian believers as substantially true, if not almost as a truism, only they would fail to recognize in it "the chief expression of Christian belief" as contained in the Creeds, or indeed any but a very secondary and, so to say, metaphorical connexion with the language of the creeds at all. The Dean himself in one passage appears to intimate that his interpretation goes beyond the meaning of "the Biblical words"—*i.e.* "the sacred names"—incorporated in the Creed, because it is a higher one, but if so, it must surely be a different one. His exposition may be thus summarized. There are three phases of religion, natural, historical, and spiritual. The first is indicated by belief in the Father, and illustrated from the familiar saying of Tertullian about *testimonium animæ naturaliter Christianæ*, and the somewhat dubious recognition vouchsafed by Renan in his Hibbert Lectures to "the Fatherly smile which every now and then gleams through Nature." To this natural religion must be added "historical religion, or the faith of the Christian Church," which is exhibited in the revelation of the Son, and includes, if we rightly understand the argument, all previous or later manifestations of human wisdom and goodness.

> He is the Second Conscience, the external Conscience, reflecting, as it were, and steadying the conscience within each of us. And wheresoever in human history the same likeness is, or has been, in any degree reproduced in human character, there and in that proportion is the same effect produced. There and in that proportion is the Word which speaks through every word of human wisdom, and the Light which lightens with its own radiance every human act of righteousness and of goodness.
>
> This is the claim that Christianity and Christendom have upon us, with all their infinite varieties of institutions, ordinances, arts, laws, liberties, charities,—that they spring forth directly or indirectly from the highest earthly manifestation of Our Unseen Eternal Father.

But this natural and historical religion must again be supplemented by a spiritual religion, which is the truth to be learnt from the third section of the Creed.

> When Theodore Parker took up a stone to throw at a tortoise in a pond, he felt himself restrained by something within him. He went home and asked his mother what that something was. She told him that this something was what was commonly called conscience, but she preferred to call it the voice of God within him. This, he said, was the turning-point in his life, and this was his mode of accepting the truth of the Divinity of the Eternal Spirit that speaks to our spirits. When Arnold entered with all the ardour of a great and generous nature into the beauty of the natural world, he added: "If we feel thrilling through us the sense of this natural beauty, what ought to be our sense of moral beauty,—of humbleness, and truth, and self devotion, and love? Much more beautiful, because more truly made after God's image, are the forms and colours of kind and wise and holy thoughts and words and actions—more truly beautiful is one hour of an aged peasant's patient cheerfulness and faith than the most glorious scene which this earth can show. For this moral beauty is actually, so to speak, God Himself, and not merely His work."

And finally the synthesis of these three methods of teaching is not "an arithmetical enigma"—as the doctrine of the Trinity, we are led to infer, is apt to be made—but the great lesson, conveyed in the poet's words, that "the nature of God is vaster and more complex than can be embraced in any single formula," for

> God fulfils Himself in many ways
> Lest one good custom should corrupt the world.

As to the Dean's theory of three elements of religious belief, natural, historical, and spiritual, considered in itself, there is little to be said but that it is, however certain and fundamental, among the tritest commonplaces of Christian apologists and divines of every age and school. The first element is attested by all writers who have insisted, like Butler or Paley, on the moral or physical proofs of the existence of a Supreme Ruler of the world; the second is exemplified in the countless works devoted to urging the internal and external evidences of the truth of the Gospel Revelation; while the yet vaster mass of hortatory and devotional literature illustrates the conviction of every generation and every section of Christian believers that the outward witness requires to be quickened and confirmed by the still small voice which is the inward testimony of conscience. So far the Dean will find none of those whom he is addressing likely to dispute his view, because he is simply telling them what all Christians, "early" or late, have always assumed or acknowledged as matter of course. What may fairly be asked is whether this obvious distinction of three elements in religious faith affords any real interpretation, and still more whether it affords, as is implied throughout, the only real and adequate interpretation, of the Apostles' Creed. Surely to state the question is to answer it. We may, if we please, idealize the creeds as a distinguished Bishop of the minority is reported, after the Vatican Council was over, to have idealized the obnoxious definition, while openly professing to regret it, by explaining that in this age of indifference and unbelief it was specially incumbent on all good Christians to bear witness to their faith—if necessary by dying for it—and that this obligation rested with peculiar force on the chief bishop of Christendom, who might therefore be considered to represent in a peculiar sense the infallible witness of the Church to the truths entrusted to her keeping. But it will hardly be pretended that the intention of those who framed and passed the Vatican decree is satisfied, or even partially represented, by this supposed desire to administer to the Pope a solemn reminder of his weighty responsibilities. And just as little does Dean Stanley's explanation exhaust, if it even touches, the "high signification" of the early Creeds in the mind of those who framed and accepted them. Their purpose was a very different one, as is shown by a writer not much more friendly than himself to the dogmatic aspect of Christianity. "It was essential," observes Milman in his *Early Christianity*, "that *the main points of doctrine* should be fixed and cast into plain and emphatic propositions," and hence "creeds became of essential importance to compress *the leading points of Christian doctrine* into a small compass." But these points are exactly what Dean Stanley dis-

misses as "algebraic symbols" or "arithmetical enigmas" to make way for that broader and loftier conception of "Christianity as it has appeared to Voltaire, Rousseau, Goethe, Mill, Renan." He may or may not be right in preferring this broader view, which unites together all true "soldiers of the Holy Ghost, whate'er our race or creed," to what he regards as narrower and "anthropomorphic speculations"; with that question we are not now concerned. But we must protest, in the name of history and common sense, against this bold attempt to identify "the creed of the early Christians" with a view which, in the shape it is here made to assume, they would probably have altogether repudiated, while the notion of its supplying in any case an adequate explanation of "the simple baptismal formula" which lies at the basis of both the Eastern and Western Creed, would have appeared to them wholly unintelligible. Had they thought with Dean Stanley all the controversies and Councils of the early centuries might have been avoided, and the entire course of ecclesiastical history would have been—whether for better or worse—very different from what it actually was. But meanwhile the fact of its being what it was is alone a sufficient refutation of this paradoxical estimate of their belief.

MODERN SONNETS.

THE sonnet is an interesting example of the "survival of the fittest." It is but one of the many formal kinds of verse which the poets of Italy and France invented, because the multiplicity of rhymes in old French and Italian made poetry seem too easy. The other trials of patience and ingenuity, the *sestine* and the rest, only exist as curiosities, are only practised by way of mental gymnastics, and are scarcely read except by experts. The comparatively simple quatorzain, on the other hand, has certain qualities which have won for it a permanent existence. The difficulty of managing the rhymes is just great enough to invite experiment, and to allure authors who, but for the sonnet, would never have put their thoughts into verse. Thus the sonnet is the place of repentance, so to speak, for inveterate writers of prose, and some men have won a slender but enduring poetical fame by one fortunate example. Of this class Blanco White is the best known. His single sonnet, like the "single speech" of Hamilton, has preserved a name that would have been forgotten in the throng of mild and melancholy heretics. This piece of Blanco White's is a capital illustration of certain obvious virtues of the sonnet. The first two quatrains are found convenient for presenting some picturesque text, some sketch, perhaps, of external nature, while the last six lines answer to the "summing up" of a sermon, and to the "moral application." Thus, in White's sonnet, the first two quatrains describe "mysterious night," the sudden stars, and their probable effect on the first persons who observed the phenomena of darkness, while the last six lines draw, with some novelty, the ancient and obvious parallel between night and death:—

> Why do we, then, shun death with anxious strife?
> If light can thus deceive, wherefore not life?

So moral is this sonnet that it ends with the thoroughly English conclusion, a rhyming ethical couplet. The Italian rules forbid this sort of termination, which squeezes out, as it were, the last drops of moral significance remaining in the chief thought of the verses. The sonnets of the French and Italians are as frequently amatory as moral. But it is worth noticing that the author of "A Talk about Sonnets," in *Blackwood's Magazine*, quotes scarcely any but moral or religious English sonnets.

The sonnet is a form of verse which every one may not unhopefully attempt to write, yet it has a special attraction for genuine poets, who are more skilled in form than abundant in matter—and it has sometimes, as in the cases of Shakspeare, Spenser, Sidney, and others of our Elizabethans, attracted the wealthiest as well as the most cunning of singers. Early Italian and sixteenth-century French literature twitter with sonnets, like a "wet, bird-haunted English lawn" with the music of thrushes in April. The sonnet is to modern Europe what the "epigram" was to the Greek poets whose works make up the bulk of the Anthology. These poets are, as a rule, of a late period, and belong to the erudite and shallow Alexandrian age. As a rule, too, they have little enough to say, and are careful to say that little well, in the most graceful and concise form. They give us merely an impression, a picture, a thought gracefully set, in melodious elegiacs. So far the epigram answers to the sonnet, and Shelley appropriately translated, into what he meant for the sonnet form, two short pieces of Moschus. Yet both these "sonnets" of Shelley's are "licentious," that is, they avoid the trifling difficulties imposed by the Italian rules of the game. The Alexandrian epigram differed, indeed, from the sonnet, in two ways. The epigram was shorter; it became a commonplace to say that an epigram over four lines long threatened to overflow into an epic. The epigram also wanted the moral element which is so conveniently lodged in the last six lines that sum up the quartorzain. Yet the analogy between the Alexandrian epigram and the modern sonnet is so close, that we naturally look for a rich crop of sonnets from our own poets who live in literary conditions not unlike those of the Alexandrian age. When poetic cleverness and ingenuity were abundant in Greece, when creative power was almost exhausted, when criticism was minute and exacting, the Greeks poets produced epigrams. Therefore, when poetical ingenuity, when the love of delicate form, and the absence of anything particular to say are plentiful in modern England, we seem to have a good right to look for abundance of sonnets. Any one who wrote a history of English literature on *à priori* principles, and under the guidance of analogy, would be tempted to maintain that the late Victorian age should be the paradise of the sonneteer. Everything tends to make that conclusion probable. The mechanic art of poetry is highly cultivated. No one has anything large or epical to say; there is no exuberance of poetic thought, there is no wild spurning of conventional rules such as those which protect the sonnet. Yet, as we mean to demonstrate, our age has produced very few sonnets worth preserving, and our chief poets, who have tried every style, have left the sonnet almost untouched. There are of course exceptions to a general rule, but a collection of sonnets by eminent modern hands would too closely resemble the basket into which Brummel's valet threw "our failures."

Before going on to demonstrate this, or at least "to make it seem extremely plausible," by aid of examples, it may be as well to remark that the fortunes of the sonnet in the earlier part of the century were scarcely less singular. Wordsworth and his contemporaries were not too fond of what they considered "form," and of the artificial in poetry. They had abundance of matter. They were the literary children of an age of political revolution. Yet two of them, at least, Wordsworth and Keats, were with Milton the greatest English masters of the sonnet. They did not always submit to be bound by the Italian rules. Perhaps the two most famous and lovely of Keats's sonnets are the one on Chapman's Homer, and his last lines, beginning—

> Bright star, would I were steadfast as thou art.

The former is technically perfect, the second is absolutely licentious. It breaks every rule, except that which requires the sonnet to consist of fourteen lines. As to Wordsworth, the number of his strictly formal sonnets is almost as remarkable as the excellence of many of them. The copious and simple poet, who might have been expected to scorn all narrow boundaries and artificial rules, is the poet who loved them best. His practice was the converse of that which distinguishes poets, neither too copious nor too simple, the poets of our own period.

To begin with Mr. Tennyson; it is strange that this master of form and symmetry, this consummate artist in words, has so rarely attempted the sonnet. He is our modern Theocritus—without the epigrams. The most recent and complete editions of his works contain but few sonnets. The scarce *Poems chiefly Lyrical*, of 1830, give us a few experiments. The first,

> Could I outwear my present state of woe,

is a Shakspearian echo, is irregular in rhyme, and ends with a rhymed couplet. The second, third, and fourth sonnets are even more irregular. The very beautiful poems called "Love and Death" and "The Kraken" are composed of fifteen lines each, and but distantly partake of the nature of the sonnet, yet they are only a little more irregular than the well-known "Sonnet to J. M. K." A singular poem on "Love" is composed of two irregular sonnets, and a third piece of sixteen lines. Among Mr. Tennyson's other sonnets, "Buonaparte," "Alexander," and "Poland" are perfect in form and noble in sentiment. These are nearer Milton's work than any other modern sonnets. It is plain, however, that this form has few attractions for a poet who has managed to breathe music even into English alcaics. As to Mr. Browning, he is so unlike other poets of his age that what we expect from them we do not look to receive from him. It is probable that he has written sonnets, though we cannot at present remember a single example. There is not one in the delightful and immortal first volume of lyrics, in the edition of 1865. Another poet might have been tempted to cast the thoughts of "Memorabilia" in the mould of the sonnet. Mr. Browning has preferred a looser lyric form, just as Thackeray preferred to recast into looser lyrics Ronsard's beautiful sonnet on the old age of his mistress. Once more, the sententiousness, the limited scope, the ethical capacities of the sonnet, might seem to adapt it for the use of Mr. Matthew Arnold. He has written more sonnets than any other of his more famous contemporaries, unless we include among them Mr. Dante Rossetti. Yet the regularity, the fixed rules of the sonnet, seem not to please Mr. Arnold, as they certainly delighted Milton. There are a few sonnets in Mr. Arnold's first volume, *The Strayed Reveller*, (1849), and some of these are included in the *Selected Poems* (1878). We miss there the very characteristic sonnet, "To an Independent Preacher," beginning—

> In harmony with Nature? Restless fool,

which we take to be the first wild warwhoop in Mr. Arnold's long battle with the Dissenters. The others, on the "Duke of Wellington," "Mr. Emerson's Essays," "Butler's Sermons," and so forth, are invariably irregular. People who care for poetical technicalities will notice with interest that Mr. Arnold's later sonnets, first published, we think, in 1867, are as invariably regular in form, and strictly comply with the Italian rules. In substance they are all didactic and even austere:—

> Such, poets, is your bride, the Muse! young, gay,
> Radiant, adorn'd outside: a hidden ground
> Of thought and of austerity within.

Mr. Swinburne has published comparatively few sonnets. A critic, Mr. Palgrave, if we are not mistaken, has remarked that the constraint of the sonnet was serviceable to Shelley's abundant

genius, and that "Ozymandias" is a fine example of his work when unusually compressed. Mr. Swinburne's poetry is not famous for terseness, and in the sonnet's narrow limits he might have found a serviceable discipline. He has but rarely gone into this voluntary captivity, and among his sonnets that which we best remember is addressed to Dean Stanley in a tone of ferocious remonstrance. Certain other political sonnets are remarkable for concentrated virulence, not to say compressed Billingsgate. For these the poet himself has offered a kind of apology. When "indignation makes verses," however, the sonnet is not the best vehicle for her invective. A selection of modern sonnets would be incomplete without specimens of Mr. Swinburne's work, yet we remember none at this moment, which possesses the melody and grave charm of Keats's and Wordsworth's best examples. In short Mr. Swinburne, like his chief contemporaries, does not find in the sonnet a very natural or very favourite means of expression. It is just worth mentioning that, when Mr. Clough did write sonnets (*Ambarvalia*, 1849), he chose for his text "Blank misgivings of a creature moving about in worlds not realized." In a more festive mood, in "Commemoration Sonnets, 1844," he sang of Leonina—

> To partner academical and slow
> Teaching, upon the light Slavonic toe,
> Polkas that were not, only should have been.

In another sonnet we read how—

> Phillimore
> For the supreme superlative cons o'er
> The commonplace book of his classic head.

Ambarvalia has become so rare a book that it may be worth while to quote these fragments of Clough's infrequent and informal sonnets. Mr. William Morris has probably written several sonnets, but we have only discovered two (if sonnets they can be styled), the lines called "Summer Dawn,' in the *Defence of Guinevere*, 1858, and some verses prefixed to the "Story of Grettir the Strong." In the former piece the last three lines end with the word "corn," which rhymes to "dawn." It will be admitted, by Mr. Morris's admirers, that he is distinctly weaker in the sonnet than in narrative verse. Thus Mr. Dante Rossetti is the only modern English poet of considerable reputation, who is chiefly known for his skill as a sonneteer. It would be superfluous here to criticize verses which seem to have lost something of their original charm. Almost all sonnets are addressed, in the first place, rather to professionals and amateurs in verse-making than to the general world of readers. Mr. Rossetti's had sufficient strangeness of thought, and sufficient technical mastery, to win many admirers, some of whom are now estranged. His sonnets, with all their Italian qualities, can never compete in universal charm with those of Keats, Wordsworth, Milton, and Shakspeare, yet they are probably, with Mr. Tennyson's, the best which have been produced by the acknowledged poets of our period. Sonnets are abundant, of course, in *writings not so generally known*, but it will be admitted, we think, that the more prominent singers of the Victorian age have either neglected or strangely failed to succeed in the sonnet—a form of verse which seems exactly suited to their genius. This only proves the difficulty of reasoning from analogy in the history of literature.

OLD CLOTHESMEN.

A SOCIAL problem which always puzzles us is that of the motives which induce men to betake themselves to disagreeable or unsavoury callings. No doubt the impecunious must live somehow, and the Old World is overcrowded. But then there seems no especial reason why any particular person, when making his start in life, should choose, for instance, to be a stoker in a seagoing steamer, or to carry a scavenger's shovel in place of a bricklayer's hod. We suspect, however, that sentiments transmitted by descent go for a good deal in the matter, and that certain families turn to certain trades either from hereditary instinct or from force of paternal example. The child, as he gets beyond the toddling stage, dreams fondly of treading in his father's footsteps; and, by the time he is strong enough for an apprenticeship, has come to the conviction that his father's line is the one he must follow. So in France the Auvergnats, and in Spain the Gallegans, furnish all the water-carriers to Paris and Madrid. So the Savoyards and natives of the Engadine supply pastrycooks and sugar-bakers to the rest of Europe; while the men of the Abruzzi, descending in gangs from their mountains, appear honestly to believe that there is melody in their bagpipes, and vie with Piedmontese organ-grinders in driving peaceable Londoners to exasperation. But nowhere perhaps do the proclivities of race come out so distinctly as in the vocation of the old-clothes dealers. The Hebrews scattered abroad over Europe, from the banks of the Thames to the shores of the Bosphorus, from the wharves of Hamburg to the mole of Naples, have marked it specially for their own. Go where you will into the Jews' quarter, in a Houndsditch, in an Italian Ghetto, or a German Judengasse, you become conscious of the scent of fusty raiment, blended with the rancid fragrance of fried fish. No wonder. The front of each second house is festooned with tapestries of coats and female dresses; while beneath are ranged in rows all varieties of boots and shoes, from the vamped-up Hessians and Wellingtons down to the faded white satin slipper. The genius of the born artist will expand itself in the most uncongenial atmosphere; and the soul of the keen-eyed occupant of the establishment is evidently gladdened by the spectacle of his own æsthetical handiwork. When he is not reposing on the threshold, or reclining in meditative mood against the door-post, under the ample draperies of some mantle or capote, he is sauntering out across the pavement for a broader appreciation of the effects. We are far from saying that prosaic pecuniary considerations have not their share in inspiring his complacent admiration. Each coat or vest, or pair of revived continuations, represents, or ought to represent, a satisfactory bargain; and, when the time arrives for disposing of the article, it should leave a substantial profit behind it. In any case, it infers that sharp contest of wits over the terms of a higgling transfer which is the very salt and excitement of petty commerce. But though the dealer in second-hand slops may be a practically-minded man, it is impossible to believe him blind to the æsthetic aspects of his shop front. Though he lives now, as his ancestors may have lived from time immemorial, in the midst of strange peoples of phlegmatic minds and under the depressing shadows of a Western cloudland, yet he is come himself from the climes of the East, and has preserved something of Oriental tastes and fancy. To those inborn graces of imaginative thought are due the artistic distribution of garments which, though individually they may be simple enough in cut, yet swell and fall in waving beauty lines as they hang heaped one over another on the rusty nails. Nor is the light of colour lacking altogether, though sable of course is the predominant hue. Here and there is the resplendent scarlet of Her Majesty's service, or the more brilliant fancy tints of some still more superb uniform which, displayed on the shoulders and limbs of some stalwart footman, has lit up the entrance-hall of a West-end mansion. And there is bullion as well in the shape of epaulettes, lace, and buttons, which would sparkle, tarnished as it is, did the sun ever succeed in reaching it.

We know that these establishments must do a considerable business, as it is certain that many of the respectable lower classes must always dress themselves in cast-off apparel. As a matter of fact, however, the master of the place almost invariably appears to have time upon his hands. We take the probable explanation to be, that his customers generally wait upon him at hours when the chance wanderer is least likely to penetrate into the quarter. Working people go before or after their working hours; while the shabby genteel who have seen better days prefer to do that kind of dealing under cover of the dusk, though the doubtful light of the smoky gas-burners must be all to the advantage of the merchant in the bargain. But when a customer does drop into the premises at high noon, see how the proprietor wakens up to activity. Drop in, we say; but more often than not the customer is brought to a standstill by eloquent appeals which are enforced by action. As his eyes have gone roving from side to side of the lane, each movement has been anxiously watched by half a dozen hungry competitors. "Walk into my parlour," said the spider to the fly," is the sentiment of all those worthy gentlemen, more or less forcibly or feelingly expressed. At length, after driving to the verge of desperation several honest dealers who dare not move many steps from their doors, the hesitating lounger is finally stopped. He yields to an eloquent clutch at his coat sleeve, and decides to go in for the preliminaries to a deal. On learning his wants, the merchant takes his measure with the eye of talent chastened by experience, and makes a dash at the particular coat or pair of pantaloons which, as he swears beforehand, ought to fit to a nicety. The bargain may be broken off, after an enormous expenditure of breath and an excess of violent and angry gesticulation. In any case, it is long before the transfer is effected. If the customer hesitated provokingly before coming to a stop, the dealer is at least as backward in boldly naming his price. An anxious struggle is going on in his soul; for, on the one side, he may overshoot the mark, and scare away the interlocutor to an opposition shop; on the other, he may lay up for himself unavailing regrets by asking a sum that is easily conceded. Nineteen times out of twenty he decides upon a middle course, and puts his demand in a tentative tone which shows that he is fully prepared to be beaten down. In fact, a sale could hardly give him satisfaction unless it resolved itself into a higgle and a wrangle; for he has the habits and likings of those Oriental traders who sit cross-legged upon their shop-boards in the bazaars of the East, consuming unlimited coffee and tobacco over a negotiation. And the client, when he has consented to terms and counted out the money, must feel that he has more or less put into a lottery. No doubt he has tried the texture by rubbing and twitching at it, and closely scanned the stitching of the seams, and peered into the dye. But we imagine that there are as many tricks in the old clothes trade as in most, and that a coat and waistcoat may be got up for sale as cleverly as a horse or an "ancient master." The stout-seeming woollen fabric may turn out to be shoddy; and the glossy black, which made the surtout of broadcloth seem fit for a dean or a fashionable doctor, may change, through shades of purple, to rusty brown, with very slight wear and exposure.

Disposing of these second-hand wares is only one branch of the business. The stores must be accumulated from remote regions of more or less respectability and fashion, whose denizens have but the vaguest notions of the geography of Petticoat Lane. The master of the place or his assistants—probably the junior members of the family—go out on their daily quest. Who does not know the familiar figure of the old clothesman, respectably attired himself,

as he may well be, considering the wide range of the wardrobes from which he may pick or choose? You see him moving along the pavement at what one might call a lively crawl, for though his pace is necessarily slow, his every faculty is on the alert. No district is too highly exalted for him; in fact, it is in the higher spheres of society that he does the most profitable strokes of business, for the servants in wealthy families come in for the clothes of their masters. Yet he does not make so good a thing of it as might be expected, for valets and ladies'-maids of extravagant habits get to know pretty well the market value of the articles they vend; they become as sharp over bargains as the Jews themselves; and there is a brisk competition for their favours among the gentlemen of the blue bags. There the merchant comes, sticking close to the area railings, casting an occasional glance up to the windows on either side, now and again breathing a hoarse whisper confidentially into the ear of some *flâneur*. And ever and anon he utters that distinct though subdued "Old clo'" which gives warning of his passage like the bell of the muffin-man. Now he stands, nodding insinuatingly through the railings; it is clear that his becks and wreathed smiles have met with an encouraging response, and speedily the spring is touched from below, the gate slips open, and he disappears down the steps. When he emerges his bag is more bloated than before, and there is an agreeable smile about the corners of his lips indicative of a fortunate achievement in business. As the day draws on, and the bag gets bulkier and heavier, his heart grows lighter; and there is the sense of satisfaction expressed in his carriage, if his step becomes less elastic. When he has shot out the contents for inspection and admiration in his dingy back-parlour, he can sit down to his supper with a light heart.

An ingenious writer might hunt out themes for innumerable romances from those dingy museums of musty garments. Balzac, for example, might have found more suggestiveness in them than in the gorgeous "properties" with which he heaped his apartments when writing some of his most fantastic stories. The many-piled black velvets worn by Royalty must sink to that level sooner or later, passing through heaven knows what strange transformations on the way. That brocaded silk, though now dyed and shaped out of knowledge, throbbed over the bosom of some high-born beauty when advances were made to her that were pregnant with her fate. Those kerseymeres formed part of the Court suit of some great Minister, and that ermine now cut down for a muff showed originally on the robes of a learned Lord Chancellor. And *à propos* of ermines and velvet, we may observe that it is in the cold of the North or in the splendour of the East that the romance of vestments becomes most suggestive; partly because, being more durable, they survive through a longer course of vicissitudes, but also because there the reign of law gives place so often to the excesses of authority, and consequently to the violence of the reaction they provoke. Conspiracies having bloodshed for their object are common, and political murders by authority still more frequent. If the rich stuffs could speak that are exposed in the vaulted bazaars of Stamboul, they might betray strange records of Palace secrets. Were there no other cause for it, there must generally be a certain mysterious horror about these stuffs, because they may contain the germs of the plague or of some scarcely less deadly contagious disorder. The Eastern, who is a fatalist by feeling as by religion, has assuredly never dreamed of ventilating or disinfecting them. The chapman who bought them, being equally resigned to his destiny, asked no questions, and troubled himself about no precautions. Since then, folded aside on the shelves of a windowless and sunless cavern of stone, they have never seen the light; and for ourselves, though little given to morbid apprehensions, we should be exceedingly sorry to buy them at any price. Yet there can be no question, by the way, that similar objections may possibly apply to dealings with the old clothes' merchants of Western cities; and perhaps we might trace the elements of tragedy in the consequences of many an "extraordinary bargain," when the introduction of a piece of second-hand clothing to a household has heralded the arrival of the doctor and the undertaker.

LAKE SERBONIS.

ON several occasions we have mentioned the difficult problems presented by the question of the Exodus. There are, as every one knows now, two different theories on the subject—that is to say, all the theories, and they are many, may be broadly divided into two schools. One party maintains that the Israelites crossed the head of the Gulf of Suez—as to how far north or south almost all authorities differ. Another party maintains that not the Red Sea, but a branch of the Mediterranean, was the sea crossed. This latter theory was originated many years ago by Schleiden, and, in spite of the support of Richter, had been almost abandoned when it was taken up by Dr. Brugsch, who published a tract on the subject accompanied by a map, and read a paper at the Oriental Congress in London in 1874, which, to say the least, startled his hearers. When the paper was subsequently published it was found that Dr. Brugsch had withdrawn some of his most remarkable statements and modified his theory; but enough remained to have a considerable effect upon the opinion of persons interested. His position may be briefly stated as follows. The Israelites, fleeing from Zoan, which Dr. Brugsch identifies with San, the ancient Tanis, left Egypt by a narrow tongue of land, which was bounded on the north by the Mediterranean, and on the south by a lagoon of weeds, which he identifies with Lake Serbonis. It might be supposed that, before promulgating such a view, Dr. Brugsch would have been at the trouble of visiting the spot and seeing for himself whether such a passage would be feasible. No such visit on his part, nor, so far as we are aware, on the part of any geographer, has been made in recent times to the locality in question, and it was reserved for Mr. Greville Chester, at the instance and with the assistance of the directors of the Palestine Exploration Fund, to traverse the whole of the proposed route, and by the information which he has brought back to settle the question as far as it can be settled after the lapse of so many ages. His conclusion may be stated in a few words. The Israelites cannot have marched along this tongue, for the simple reason that it does not extend to the mainland at the eastern end, but is interrupted by an arm of the sea.

Mr. Chester's journey was made in the beginning of the present year, and his account of it is published in the current quarterly statement of the Palestine Fund. Mr. Chester has himself, he says, no particular theory to advocate with regard to the Exodus; all the theories before the public present, in his opinion, difficulties almost insuperable. He objects to the use of the term "Red Sea," borrowed, as he observes, by the translators of the Authorized Version from the Septuagint. The Hebrew term Jâm Sûf is usually translated by modern scholars to mean a "sea of weeds," and Dr. Brugsch speaks expressly of the Lake Serbonis as a weedy sea. Unfortunately Mr. Chester has found that the waters of the Lake Serbonis are salt, and as devoid of lacustrine vegetation as the Dead Sea itself. Mr. Chester began his journey by proceeding from Cairo to San, which is unquestionably the Zoan of Scripture. He gives an interesting account of the remains to be seen there. The site of this great city he describes as covered with an "avalanche of immense stones," the remains of the mighty temples and "store-houses" which the oppressed Israelites helped to build. Passing eastward from San to Tel-Dephneh, identified by Dr. Brugsch as the Chetam of the monuments and the Etham of the Book of Exodus, he crossed the Suez Canal at El Kantara, and sought for the site of Migdol. Here he fell in with an intelligent Arab, who accompanied him during the rest of his journey, and who displayed a considerable amount of local knowledge. Strange to say, he asserted that there is no such place as Tel-es-Samut, which Dr. Brugsch names as the site of Migdol. Mr. Chester, however, found a Tel, or mound, called by the Arabs Haboua, which answers to the Samut of the map. Next, striking north, he visited the remains of the ancient Pelusium, which used to be called the "key of Egypt," and is memorable as the scene of Pompey's death. He found them situated in a vast marsh, and consisting chiefly of mounds and the traces of some fortifications. The most remarkable of these are named, respectively, the Mound of Gold and the Mound of Silver. The latter is entirely surrounded by the marsh, in spite of which Mr. Chester waded across, and had the satisfaction of standing at last upon the summit. The difficulty of proceeding was great, the surface of the marsh, which extends for miles, was covered with drifting sand, and with not only an efflorescence, but with long crystals of brown salt, through which, as through a cake, the feet went down into a greasy mud, of which large masses adhered to the boots each time they were withdrawn. When Mr. Chester was within two hundred yards of his goal further progress seemed impossible, and the enterprise had nearly been given up; but as the difficulties of returning were as great as going forward, he persevered, and succeeded at last. The top of the Tel commands a view of the sea, breaking on a sandy beach beyond a swamp, about three miles distant. The desolation was complete and awful. There was no fresh water, no sign, and indeed no possibility, of human habitation. Night fell before the traveller reached his tent. Next morning he set out for the supposed site of Pihahiroth. In about two hours and a half he reached the open shores of the Mediterranean, and pursued an eastward course along the beach, making for a low headland called by the Arabs Golse Hendeyeh, a sandhill of moderate elevation, its sea-front defended by massive walls and towers of hewn limestone. Ascending to the top, he found himself at the "entrance of the gulfs"—the Pi-ha-Chiroth of the papyri, as cited by Dr. Brugsch in accounting for the name, which has in truth a thoroughly Egyptian sound. Looking eastward from the headland, he saw, as far as eye could reach, a narrow strip of land, with the Mediterranean on the left hand, and the great Lake Serbonis on the right, "upon the opposite side of which the low desert hills shimmered in the heat and mirage." Identifying this strip of land with that represented in Dr. Brugsch's map as forming a kind of bridge from Egypt into Palestine, owing to the existence of an isthmus connecting it at Mount Casius with the mainland, he descended, and commenced his journey between the sea and the lake. "Little did I then imagine," he says, "that the whole course of my route would be altered by that Isthmus being a mere creature of the learned Doctor's imagination, and having no existence in fact!"

Mr. Chester travelled till nightfall along this narrow strip, and pitched his tent at a distance of eighty paces from the sea and two hundred from the lake. About two o'clock in the morning he was awakened by a noise, and found that the wind had changed, and a furious tempest threatened to sweep his tent away. Going out at daybreak, he found, to his surprise, that "the sea had seen

that and fled." It was now dead calm, and the sea had retired no less than twenty-six paces from the point which it had reached the night before. On this Mr. Chester observes that, presuming other parts of Dr. Brugsch's theory to be correct, one might admit that supposing the sea, driven by a strong north wind, were breaking over the beach into Lake Serbonis, the water would be driven back or divided by a south or south-east wind, and a track between the two waters might then be poetically described as having a wall upon either hand. The wind returning to the north would drive the sea over the narrow belt of land and sweep the passers by towards the lake, where, in the quicksands, men, horses, and chariots would speedily be engulfed. It was probably near this spot that the Persians under Artaxerxes were destroyed. Mr. Chester was unable to get within three or four yards of the water of the lake owing to the treacherous nature of the soil. During the day he arrived at the cape identified as Mount Casius, and his fellow-traveller informed him that, on some occasions the Mediterranean joins the lake and makes this mountain into an island. Dr. Brugsch makes Mount Casius the Baalzephon of Scripture. The prospect from the summit was startling. Dr. Brugsch, says Mr. Chester, connects the mainland with Mount Casius by an isthmus of desert, "which he colours yellow to represent sand, and shades with black to represent hills." But the lake at this point is wide, and there is no such isthmus.

Relying upon this map, he had intended to cross from Mount Casius to the main land, and could not imagine why the Arabs had pronounced the route impossible. He camped another night on the narrow strip of beach, and starting next morning in good time, arrived after a march of five hours and a half at the spot where a channel connects the lake with the sea. The sea-water was running through the channel like a mill-race. A few years ago it was silted up, and the Arabs, who live by fishing in the lake, re-opened it with great labour. For some miles before it is reached, the strip of beach is not more than fifty feet wide. The passage of an army by such a route is obviously impossible. Mr. Chester crossed with his baggage and water jars in a little boat, which only held two persons at a time. The camels were driven into the sea, and made to swim. "The scene with these ungainly animals amongst the waves with the naked Arabs screaming and splashing around them, was a very strange one, and I certainly never expected to see ships of the desert taking to the sea." The crossing was at length effected, and Mr. Chester found himself with great satisfaction upon *terra firma*. A few days later he reached Gaza, and eventually Jerusalem. The route he had taken is undoubtedly shorter than the more usual way across "the short desert" between Egypt and Syria. But the scarcity of water, the danger of encamping on an open beach between lake and sea, and the chances of the ferry, when reached, being impassable through rough weather, makes it practically useless. None of the Arabs who accompanied Mr. Chester, except two, had ever traversed this strip.

THE THEATRES.

ON Saturday last the Lyceum closed until September, the final night of the season being appropriately devoted to the manager's benefit. On this occasion the play of *Charles I.*, which seems to be still attractive in spite of its many faults of construction and writing, and of its ludicrous unlikeness to the period of which it affects to convey some notion, was given, and was followed by a mixed entertainment in which Mr. Sims Reeves, his son Mr. Herbert Reeves, Mrs. Bancroft, Miss Ellen Terry, Mr. Toole and Mr. Irving all took part. The performance of *Charles I.* was marked, as far as the acting was concerned, by many excellences and by one grave blot. Miss Ellen Terry's acting of the Queen has gained both in breadth and delicacy since she first took the part; and her playing in the parting scene had an irresistible tenderness and pathos. Mr. Irving's make-up seemed to us less good than it used to be; but, on the other hand, his elocution and articulation had distinctly improved and there was a certain dignity of restraint in his performance which made one almost forget the outrageous behaviour attributed by Mr. Wills to the King in the puerile scene between Charles and Cromwell—a scene in which the two most prominent figures of the time are perhaps more grossly misrepresented than they have ever been before, even in history. It would be difficult to decide which is the more astounding invention of the writer, Cromwell's blundering offer to accept a bribe, or the King's gross rudeness. Mr. Irving in giving interest to this monstrous scene performs a remarkable feat. The purely pathetic passages of the play, and the scene in which he delivers up his sword to Cromwell, he has perhaps never given better than he did on Saturday last. At no point did he receive any help from the acting of Mr. Forrester, whose Cromwell was a performance of singular dulness. Absurd as the part is, it yet gives, as both the late Mr. Belmore and Mr. Clayton proved, some opportunities for acting, which Mr. Forrester entirely missed. Mr. Pinero played the Marquis of Huntly, Mr. Forrester's old part, with discretion and feeling, and spoke his lines remarkably well.

In the medley of songs and recitations which followed the play, the most striking feature in some respects was Miss Ellen Terry's recitation of "Monk" Lewis's so-called poem, "The Captive." It is somewhat the fashion now to dismiss the author of *The Monk* as an entirely worthless writer, and certainly he produced some curiously contemptible work. But he had considerable invention and skill of a certain kind, of which *The Bravo of Venice* (a story which is not open to the same very grave objections as *The Monk*) is a good instance. In this tale one astonishing adventure follows upon another with pleasing rapidity, and the final disentangling of the plot and discovery that the dreaded and execrated Abellino is none other than the high-born and chivalrous Flodoardo, who has assumed his disguise with the best intentions and the best results, is capitally managed. Indeed *The Bravo of Venice*, which, when it first came out, must have seemed a strikingly original story, may be called the prototype of the whole school of modern fiction of which Gaboriau was the master. The fact, however, that Lewis could write so clever and admirably constructed a story as *The Bravo of Venice* did not prevent him from writing some extraordinarily silly plays, or from producing much verse utterly unworthy of the title of poetry. Like Eugène Sue, when he wished to be thrilling, he relied upon extravagant descriptions of physical horror, and in "The Captive," which, as has been said, Miss Ellen Terry recited on Saturday last, he outdid himself. The idea, that of a sane lady imprisoned by her husband as a madwoman, surrounded by all the horrors which used to belong to madhouses, and at last actually losing her reason under their influence, is appalling enough, but is neither impossible nor unpoetical in itself. Treated as it is by "Monk" Lewis, the "poem" is a mixture of repulsiveness and childish folly. Yet so admirable, so full of tragic feeling, of skill in varied intonation, of art to make one forget while one listened to the silliness of the writer's words in the emotion with which she charged them, was Miss Ellen Terry's recitation of this production, that one could hardly regret that such rubbish had been chosen for her to recite. The very striking effect produced was due entirely to her understanding of an idea with which Lewis was utterly unfit to cope, and her triumph over the versifier's follies gave more complete assurance of her tragic capabilities than might have been found in a performance in which the actress owed something to the author. The representation is not one which, even in Miss Ellen Terry's hands, can be called attractive, but we are glad to have seen it, if only because it confirms an opinion which we expressed some time ago, that there are scarcely any parts in the poetic drama outside Miss Terry's range. To our thinking, her performance of Lady Macbeth would be singularly fine. She has long given proof of her capacity for the few tender passages which exist in the character—too often represented as a mere ferocious virago—and few who witnessed her representation of "The Captive" will doubt her ability to deal with its sterner and more tragic sides.

In contrast to "The Captive" was the skilful and brightly humorous reading of *Major Namby* by Mrs. Bancroft, of whom Mr. Irving gracefully said in his closing speech that she carried sunshine wherever she went, and the unforced fun of Mr. Toole's well-known sketch, "Trying a Magistrate." Mr. Sims Reeves sang "Tom Bowling" and the "Bay of Biscay" as he alone of living singers can sing them. We have heard from those who remember Braham's delivery of the last-named song that they prefer Mr. Sims Reeves's, and it is added that Braham never attempted the daring effect of the cheer which Mr. Sims Reeves introduces. The occasion was further marked by the appearance of Mr. Herbert Reeves, who sang "Disperso il crin" (*L'Etoile du Nord*), and Mr. Cowen's pretty song, "Jessie," with perfect taste and style. The manager himself gave his well-known and always attractive recitation of Eugene Aram. The only suggestion we would make to him for the future is that the miscellaneous entertainment, attractive as it was, was perhaps a trifle too long.

Mr. Hollingshead's idea of following the French season at the Gaiety Theatre with an American season, seems to us excellent; and it is only to be regretted, first, that for various reasons which need not now be discussed, the Palais Royal Company proved less attractive to English playgoers than might have been hoped, and secondly, that the American season has opened with a play unworthy of the actor upon whom it depends. Some six years ago Mr. "Mark Twain" wrote, in conjunction with Mr. Warner, an extravagantly incoherent and aimless novel, called *The Gilded Age*, in which the character of Colonel Eschol Sellers—a not unhappy compound of Micawber and Charles Lamb's Captain Jackson—was a more or less redeeming feature. The novel was afterwards turned into a play, which was even more undramatic than the story from which it was taken, and which was not only saved from failure, but it would seem actually attained success, in consequence of the excellent acting of Mr. Raymond, who played Colonel Sellers, a part which has as much to do with the action of the piece as Lord Dundreary has to do with that of *The American Cousin*. It would be rash to say of any play that it is the worst that ever has been or will be produced at a theatre of which the manager is thoroughly up to his business; but it is certain that nothing approaching *Colonel Sellers* in dramatic absurdity and feebleness has been seen during recent years at the Gaiety. We have suggested a resemblance in one point between this play, which is the vehicle for Mr. Raymond's impersonation of Sellers, and *The American Cousin*, which became the vehicle for Mr. Sothern's Lord Dundreary. Mr. Tom Taylor, however, whatever faults might be found with his plays, had the art of stage construction at his fingers' ends, and even when the action of *The American Cousin* is cut down to make way for a character which Mr. Sothern's invention raised from nullity to importance, yet there is an intelligible and not uninteresting story running through the piece. The proportions of the play are disfigured, but it retains coherence. *Colonel Sellers* is without proportion or coherence, and it would perhaps be an insult to the

memory of "Monk" Lewis to say that this piece might be compared to a version of *The Castle Spectre* in which the strangely crude incidents were retained in spite of the acknowledged fact that the only attraction of the piece was the skill of the actor who played the jester. People who have not been unhappy enough to read *The Gilded Age*, and who have been so fortunate as to see Mr. Raymond in the "dramatic sketch" founded upon it, must, if they attempted to make out what the piece meant, have had what the Americans call "a bad time." Why the authors, having invented or arranged an effective character, and found an actor who could give it its full effect, should not have taken the trouble to surround this character with a decent framework is an inscrutable problem. The fact that *Colonel Sellers*, as it stands, has been successful in America suggests some curious reflections. Mr. Raymond's acting is, as we have hinted, of a high degree of merit; but, although this has been widely recognized, the intrinsic badness of the play has prevailed in London over the attractiveness of his performance. The same thing has happened with other American plays, among them *Fritz*, a ludicrous hotch-potch, for which Mr. Emmett's talent was unable to secure popularity. The natural conclusion is that American playgoers are more easily satisfied than English playgoers in the matter of dramatic writing, or rather perhaps that they are content, for the sake of one good piece of acting, to endure an amount of absurdity and weariness which to us appears intolerable. The conclusion that good acting is more rare in America than here would seem to go hand-in-hand with this, and is not unsupported by other facts.

To discuss *Colonel Sellers* as a play would be, as may be guessed from what has been said, both tedious and superfluous. It resembles *Fritz* in ending with an utterly ludicrous scene in court, and it may be supposed that such scenes are popular with American audiences. There is this difference, however, between the two. In *Fritz* the court-scene is intentionally and essentially farcical. In *Colonel Sellers* there is, or is supposed to be, a serious interest, the climax of which is the iniquitous acquittal by a jury of a girl who has murdered a man who has wronged her. But whatever shade of interest might attach to the impossible working of a story which does very little credit to its author is subordinated entirely to the comic interest which belongs to Sellers. In short, the play is about as bad as a play can be, and it is much to be regretted that Mr. Raymond has not appeared in something more worthy of his undoubted talent. To his acting high praise may be safely given. He has caught with singular exactitude the manner of a certain type of American, and has imported into it with fine discrimination the characteristics rudely suggested by the author or authors, while his technical skill is remarkable. Colonel Sellers is thus described in *The Gilded Age* by one who has suffered from his love of speculation:—"*He's* never down-hearted—never had any trouble in his life—didn't know it if he had. It's always sunrise with that man, and fine and blazing at that—never gets noon, though—leaves off and rises again. Nobody can help liking the creature, he means so well—but I do dread to come across him again; he is bound to set us all crazy of course." These characteristics are admirably caught and rendered by Mr. Raymond, in voice, gesture, and movement throughout the piece, and this is done with a commendable freedom from exaggeration. Perhaps the best and purest bit of comedy acting occurs in the scene when, having invited a friend to dinner, Sellers finds nothing to give him but turnips and water, and carries off the situation with the same kind of air which made Lamb write in *Captain Jackson*—"Wine we had none; nor, except on very rare occasions, spirits; but the sensation of wine was there. . . At every meagre draught a toast must ensue, or a song. All the forms of good liquor were there, with none of the effects wanting." In saying that, in spite of the coarseness and vulgarity with which the scene in *Colonel Sellers* is written, Mr. Raymond's broad but finished style of acting reminded us of the passage just quoted, we give him high praise. *Colonel Sellers* is followed by Buckstone's clever and vigorous little piece *Good for Nothing*, in which Miss Farren's truthful and spirited performance of Nan is very well worth seeing.

RACING AT GOODWOOD.

ALTHOUGH the week during which the late Goodwood meeting took place was excessively wet, there was no rain to speak of during the races except on Friday. Yet the roads to the racecourse and the ground immediately around the enclosures have rarely, if ever, been so saturated with wet during a race meeting as they were last week. Just before the racing began, on the first day, a violent tempest deluged the crowds of people who had arrived to see the races, and there was a hurried scramble to collect and shield from the rain the tablecloths and eatables that had been laid out for *al fresco* luncheons. On Wednesday, although the weather was cloudy and chilly, it was tolerably fine, but the authorities had depended too much upon the rain superseding the watercarts, for clouds of dust reminded the race-goers of old Goodwood times. It is seldom that heavier rain is seen than that which fell on the morning of Thursday, and many parts of the roads and lanes leading to the course were perfect swamps. There were broken carriage springs; there were omnibuses sticking in the mud; and there were pedestrians wading, ankle-deep, in slush. The enclosures themselves were covered with a paste-like mud, and the slopes were dangerously slippery. The pleasure of Wednesday's racing was to a great extent spoiled by the arrival of the news of the disaster in Afghanistan. Altogether, the late Goodwood meeting can scarcely be described as having been an unqualified success. The attendance was very good, but the greater proportion of the racing was, to say the least, indifferent. The two first races were mere matches, and the average number of horses that started for each of the eight races on the opening day was less than five. With the exception of the Goodwood Stakes and the Richmond Stakes, the racing was very uninteresting. It was a new thing to run the Goodwood Stakes on the opening day. A strong favourite was established for this race in Reveller, a four-year-old colt belonging to Mr. Jardine. He had never raced until he was three years old, and then his career had been anything but brilliant. His stable, however, was considered to be "in form," and it was generally reported that his trainer had great confidence in his chance of victory. He was by no means overburdened with weight, and a very moderate three-year-old, which ran in the race, was handicapped within 4 lbs. of him. The second favourite was Thurio, but, good horse as he is, 2 st. seemed a great deal for him to give to a highly tried horse like Reveller. Another heavily weighted good horse was Roehampton, but he had only 4 lbs. less to carry than Thurio. There can, we should imagine, be little doubt that Thurio and Roehampton were the best horses that started for the race. Bay Archer, the winner of last year, was again to start, accompanied by a stable companion named Edelweiss, who only won one out of eight races last year. Bay Archer had 25 lbs. more to carry now than he had a year ago. The nine starters went off at a very slow pace. When they had been going for about half a mile Fordham rode Bay Archer out and shot away a dozen lengths in advance of the rest of the field, which was headed by his stable companion Edelweiss. As they passed the mile post Wallenstein had got up within a couple of lengths of Bay Archer, and Reveller was close to Edelweiss. As they entered the rails Thurio, Roehampton, and Advance came gamely to the front; but their heavy weights stopped them. Edelweiss was running wonderfully well, but it was only when his stable companion, Bay Archer, was in difficulties at the distance that his jockey sent him to the front, and then it was too late, for Reveller had been allowed to get too far in front, and his fine speed enabled him to beat Edelweiss by a short head. The better looking horse of the pair won, but many good judges of racing were of opinion that if Edelweiss had not waited until all hopes of Bay Archer's winning were over, he would have won the race. As it was, Reveller barely succeeded in securing the victory. Both Sir Charles and Scobell, who were supposed to be the two best two-year-olds of the year, were to start for the Richmond Stakes. Bal Gal, the winner of the July Stakes, was also to run. The two colts already named were the first favourites, Bal Gal being the only one of their nine opponents who was considered to have any chance of defeating them. Sir Charles ran very moderately throughout the race, but about three hundred yards from home Scobell and Bal Gal came away by themselves from the rest of the field, and Bal Gal, who had a little the best of the weights, won very easily by three-quarters of a length. After Ascot, Sir Charles was the best public performer among the two-year-olds; but, now that Goodwood is over, Bal Gal must be considered to have shown the best form. Lord Falmouth once more has a flying filly by Adventurer.

Mask, the winner of the Payne Stakes at Newmarket and the Ascot Derby, won three races at Goodwood. The most important of these victories was the Sussex Stakes, in which he was opposed by Jenny Howlett, the winner of the Oaks, Apollo, who had once beaten Robert the Devil, Zealot, the winner of the Prince of Wales's Stakes at Ascot, and two other horses. It was a pretty race, for the whole field came up to the distance abreast, when Mask came forward and won in a canter, followed by Apollo and Zealot. In a former article we noticed the wonderful development of muscle on Mask's quarters. Keen-eyed critics at Goodwood said that they could detect signs of a thoroughpin on one of his hocks. His backers laid 20 to 1 on him for the Drawing-Room Stakes; but, although he won, the odds ought not to have been nearly so high, for Nereid, to whom he was giving a stone, ran within a neck of him. The pace was very bad throughout the race, which may account for her forward running. Twenty-eight horses came out for the Stewards' Cup, which is a T.Y.C. scramble. Hackthorpe was the favourite. Last year he had shown wonderful form on several occasions, but he had run badly so far this year. The rapid Phenix had a heavy weight to carry in 9 st. 5 lbs. The wretched performer, Sun of York, was much fancied under his light weight. Elf King was another very moderate horse which was a good favourite. He had not won a race for two years. At the distance, Hackthorpe, ridden by Archer, was leading, with a lightly weighted old selling plater called Veto at his quarters. Suddenly Fordham came with a tremendous rush on Elf King, and a fine struggle ensued between the three horses. As they passed the post there was only a head between each of them. Elf King was first, Hackthorpe was second, and Veto third. The Lavant Stakes was easily won by Iroquois, Isola Madre, an own sister to Isonomy, which had been purchased for fourteen hundred guineas as a yearling, being second. Later in the day, Iroquois was very easily beaten by Wandering Nun, who had beaten sixteen opponents in the Berkeley Stakes at Lincoln. It will be remembered that Iroquois ran Bal Gal to a head, on her first appearance in public; but he seems an uncertain horse, for he

ran nowhere the other day in the Great Kingston Two-Year-Old Plate, for which he started a strong favourite, with odds laid on him.

On the Thursday, Peter gave Phenix a good beating over the New Mile, in the Singleton Stakes. This was a good performance, for Phenix, as we have already observed, was thought good enough to carry 9 st. 5 lbs. in the Stewards' Cup, and now Peter had only 3 lbs. the best of the weights. The Rous Memorial Stakes, which was won last year by Robert the Devil, was a wretched affair, for only one opponent came out to follow Bal Gal past the winning post. It could not be called a race. Not only was the field so small, but the entries for the race were little more than half what they had been last year. Only two horses started for the Goodwood Cup. Indeed, for half the races which were contested during the day, only two horses started. As much as 3 to 1 was laid on Lord Bradford's Chippendale, who is generally considered about the best horse of the day, after Isonomy. Only Dresden China now opposed him. He had given her 4 lbs. and beaten her by two lengths and a half in the Cesarewitch, so now that he was giving her 3 lbs. it seemed probable that he would give her at least an equal beating. The running was made by Chippendale, at a wretchedly slow pace, and a mile and a half had been traversed before the horses began to gallop at anything like racing pace, so Dresden China's speed enabled her to do battle with Chippendale, and she won very cleverly by three lengths. There can be little doubt that such a stayer as Chippendale would have won if the running had been stronger. Dresden China has been a fairly successful mare, as she has won the Great Yorkshire Handicap, the Northamptonshire Stakes, the Northumberland Autumn Handicap, and the Goodwood Cup, and she is one of the finest looking mares on the Turf. It is more than fifty years since so small a field has started for the Goodwood Cup, and the rest of the racing on the Cup day has seldom been less interesting.

On Friday some interest was excited by the Chesterfield Cup, for which Lord Clive was the favourite; but this horse never likes heavy ground, and the three-year-old Victor Emmanuel, which had started first favourite for the Northumberland Plate, won the race in a canter. Wandering Nun, who had beaten Iroquois in the Findon Stakes, as we have already observed, won another race in the Nursery Stakes, but she was only opposed by Jessie, the winner of the Champagne Stakes at the Bibury Club Meeting. She has evidently a good deal of speed, and moreover she runs very gamely. She did not do well between Lincoln and Goodwood, but she has improved very much in appearance of late. About the most interesting race of the last day was the Queen's Plate, for which Roehampton, Thurio, and Inval started at even weights. It was generally expected that Roehampton would win. Inval made the running, followed by Thurio, Roehampton lying three or four lengths in the rear. Half a mile from home, Thurio took the lead, and Inval soon after fell back beaten, when Roehampton challenged Thurio and a pretty race ensued. Roehampton made a valiant struggle and got in front of Thurio, but as they passed the stand Thurio made another effort, and won very cleverly by a length. Lord Bradford's three-year-old filly Grey Hen, who had won a race on the first day of the meeting, won the Corinthian Plate in a canter, beating ten opponents. The Duke of Westminster's beautiful but jadish filly Evasion was made a strong favourite for the Nassau Stakes, the last race of the meeting. After a very fine race, Lord Falmouth's Muriel just managed to beat her by a head. And thus ended a dull Goodwood.

REVIEWS.

O'GRADY'S HISTORY OF IRELAND.*

FEW authors wish it to be supposed that they write solely for the pleasure or profit of book-making. The greater number would have the world believe that it is some high and noble aim connected with the welfare of humanity at large which has spurred them on to the exertion of composition and the pain of publication. Readers of Miss Austen will remember how one of her heroines believed that histories were written solely to torment those young persons who sorely against the grain were compelled to absorb some portion of their contents, and how from the bottom of her simple heart she pitied the unfortunate authors upon whom the ungenial task of creating these sources of torment was imposed. That invincible repugnance to historical studies which Catherine Morland took it for granted possessed the minds of all young persons Mr. O'Grady has found to be deeply rooted amid his fellow-countrymen of all ages. Therefore he has written this book. His first intention was to let his book "explain itself"; but, happily for his reviewers, he changed his mind, and has prefixed an introductory chapter to each volume, so that we are not left in doubt as to the motive which induced him to undertake the difficult task of writing the history of his native land. He wished to do

> something to reduce that blank, sheer wall of ignorance, apathy, and prejudice which stands between Irishmen and their birth-right—the history of the land in which they are born, and of the ancestors from whom they have sprung, and to lessen their all but invincible repugnance to believe themselves members of the ancient nation to which we have the honour to belong.

But it is not merely "ignorance, apathy, and prejudice" that Mr. O'Grady has had to wrestle with, but also positive hatred. The educated Irishman, according to his representation, looks on the history of his fathers as a sort of evil spell, which he would fain shake off if he could, "like Mordecai at Haman's gate, a cause of continual annoyance and vexation" to him. But, however annoying and vexatious it may be, it seems that "an Irishman can no more release himself from his history than he can absolve himself from social and domestic duties." We are extremely glad to hear that a people who are a source of so much annoyance and vexation to their neighbours have a perpetual hair-shirt of their own that they cannot get rid of. Mr. O'Brady goes on:—

> I think that I do not exaggerate when I say that the majority of educated Irishmen would feel grateful to the man who informed them that the history of their country was valueless and unworthy of study, that the pre-Christian history was a myth, the post-Christian mere annals, the mediæval a scuffling of kites and crows, and the modern alone deserving of some slight consideration. That writer will be in Ireland most praised who sets latest the commencement of our history. Without study he will be pronounced sober and rational before the critic opens the book. So anxious is the Irish mind to see that effaced which it is conscious of having neglected.

Such being the state of feeling abroad in the country, we cannot but admire the patriotism of Mr. O'Grady in braving the ill-will he must surely incur by thus setting himself up as a Mordecai at the gate of all his acquaintances for the sake of vindicating the memory of those departed heroes of whose glory he is so jealously proud. We only wish that he had set to work in a more critical and less poetical mood. If we were to judge his book by its title and to treat it as serious history, we should be compelled to admit that it is of very little value, both from the want which it betrays of all critical faculty on the part of the author and from the absence of reference to original authorities. But on attentive consideration of the contents we find that by so treating his book we should be doing Mr. O'Grady injustice. The title is a misnomer. Instead of writing the authentic history of Ireland, he has re-told in a poetical and freely imaginative manner some of those legendary historic tales of the bards which are to be found in the oldest Irish manuscripts. In such materials the Irish language is peculiarly rich; but, as is the case with all legendary lore, the tales frequently contradict one another, and are very wild and incredible. It is thus Mr. O'Grady describes the chaos from which he has striven to draw a connected story:—

> But all around, in surging, tumultuous motion, come and go the gorgeous, unearthly beings that long ago emanated from bardic minds, a most weird and mocking world. Faces rush out of the darkness, and as swiftly retreat again. Heroes expand into giants, and dwindle into goblins, or fling aside the heroic form and gamble as buffoons; gorgeous palaces are blown asunder like a smoke-wreath; kings, with wand of silver and ardroth of gold, move with all their state from century to century; puissant heroes, whose fame reverberates through and sheds a glory over epochs, approach and coalesce; battles are shifted from place to place and century to century; buried monarchs re-appear, and run a new career of glory. The explorer visits an enchanted land where he is mocked and deluded. Everything seems blown loose from its fastenings. All that should be most stable is whirled round and borne away like foam or dead leaves in a storm.

If "bardic minds" indulge in such extravagant emanations, no wonder there are persons who, as we infer from another passage, "fear that their sanity will be imperilled" by too freely tampering with them. Verily it would take all the lore of that mythical animal—one of the few distinct figures in the Irish mythology—the "salmon of all knowledge" himself to make head or tail of such confused materials. The shade which Mr. O'Grady has pitched upon to draw out of all this goblin transformation scenery, and to raise to the dignity of playing the chief part in two volumes of the *History of Ireland*, is Cuculain, a hero whose exploits were a favourite theme with the bards of Erin, and whom Mr. O'Grady would fain exalt into a second and superior Odysseus. His feats of arms when chosen champion of Ulster are told in a wonderful tale called the "Tain-bo-Chuailgne," or, the Great Cattle Spoil, a version of which is given by Professor O'Curry in his Lectures on the MS. materials of Irish history as being typical of the mass of the historic tales. A fragment of it is to be found in the MS. called the "Leabhar na h'Uidhre," supposed to have been written at the end of the eleventh or beginning of the twelfth century, and also in the *Book of Leinster*, a MS. of the twelfth century; but Mr. O'Curry's version and, we suspect, Mr. O'Grady's also, are based on a much more modern copy. The story of the preservation of this tale is so apocryphal that it shows, better than any other evidence we can bring forward, how much, or rather how little, credit the tale itself is entitled to. Towards the end of the sixth century Senchan, who had been elected Ard-Ollav or chief bard of the Irish, summoned all the other bards to a council, to see if there was any among them who could recite the tale of the Tain-bo-Chuailgne. None of them knew more than a few fragments of it, but they all agreed that the "Cuilmenn" or cow-skin upon which it was written had been carried off to some foreign land. Then Senchan sent off his own son and another bard to the East in quest of it, and according to another account he himself went to Scotland on the same errand. However, their efforts were in vain, nowhere could they find any

* *History of Ireland.* By Standish O'Grady. Vols. I., II. London: Sampson Low & Co. 1880.

traces of the lost Cuilmenn. The bards having failed, the saints took the matter in hand. At the grave of Fergus MacRoy, who had been one of the chief actors in the "great cattle spoil," there gathered the chief lights of the Irish Church. Among them were the two Brendans, Kieran of Clonmacnoise, and the great Collum Cill or Columba himself. The saints summoned the ghost of Fergus MacRoy, who appeared to them and recited the whole tale. It was afterwards written down by St. Kieran on the skin of his pet cow. In memory of this animal the book was called the "Leabhar-na-h'Uidhre" or Book of the Dun Cow.

As for the tale itself, it records, according to O'Curry, the invasion of Ulster by the Irish of the three other provinces, headed by Queen Meave of Connaught. The cause of this invasion was a dispute about a certain brown bull owned by Dare Mac Fachtna of Ulster, which Queen Meave had sent to borrow and which the owner refused to give up. Cuculain came forward as the champion of Ulster, demanding that the strife should be settled by single combat, and challenging the most doughty warriors in Meave's host to come out against him. In turn he defeated them all, but the queen, growing impatient of this slow way of settling the question, invaded the province, carried off the brown bull, and returned to Connaught. There another and more terrible combat took place between the brown bull and the white bull of Connaught already in possession of the field. The chronicler tells how the whole province rang with the echoes of their roaring, how the sky was darkened with the sods they threw up with their feet and the foam from their mouths; how men, women, and children hid themselves in clefts of the rocks from terror; how sixteen warriors were not only overthrown, but buried several feet underground by the white bull in his retreat. For, as the tale is clearly intended for the glorification of Ulster, the brown bull not only conquered his enemy, but tossed him till he fell to pieces, dropping the bits as he went back to his own country. Where each piece fell it gave its name to the place. Thus Athlone, which before then was Ath Môr, or the Great Ford, was changed, because the white bull's *luan* or loin dropped there, into Athlone. Such is the tale which is the groundwork of the greater part of Mr. O'Grady's volumes, only he merely refers to the latter part of it, the fight of the two bulls, in a note. No doubt this is all fable; but then, as the two parts of the tale are so closely connected, the question cannot but present itself, What probability is there that the rest of it is true or even founded on fact? The story of the preservation of the tale is certainly fiction. It must, moreover, be a fiction of a comparatively recent date. For, unless it had passed out of men's minds how persistently Columba snubbed the bards and made light of their histories, this saint would never have been placed among those who invoked the ghost of Fergus. Probably this story, as well as the tale itself, sprang from the inventive brain of the writer of the "Leabhar-na-h'Uidhre" in the form in which we now have it. It is noteworthy that this same book contains a copy of the elegy on the death of Columba, the language of which had grown so obsolete by the time it was here transcribed, that it is interlined with a glossary to make it intelligible to readers of the twelfth century. Now if the "Tain-bo-Chuailgne" was really copied from a manuscript of St. Kieran, it must have been in the same obsolete language; while if, as is pretended, it was written as it fell from the lips of Fergus MacRoy, it must have been still more antiquated, since he was a contemporary of Cuculain, who is supposed to have died early in the first century. The great difference which exists between the Irish of the sixth and of the twelfth centuries is an unanswerable argument against the existence of that mass of Irish literature of an earlier date which the Irish lay claim to. A language that is written and read does not change to any great amount unless, as was the case with Latin, it is swamped by some other and less cultivated tongue. Now even such believers in the old myths as Mr. O'Grady place the coming of the Fir-bolgs, and of the Milesians, and of all the other ancestors of the sons of Erin at dates long prior to the Christian era, and would be slow to admit that the country was after the sixth century subjected to any foreign influence powerful enough to upset a language with fixed literary forms. The warmest advocates for the antiquity of Irish literature cannot do away with the fact that the oldest specimens of written Irish now existing are glosses upon Latin MSS. of the eighth and ninth centuries, found in Continental monasteries, whither they had doubtless been taken by the Columban monks. Therefore there is every reason for supposing that the Irish, like the nations of modern Europe, first learnt letters through Christianity, and that their first written books were in Latin. Nor is there any good reason for doubting that the Lives of the Saints formed their first literature in the vernacular, and were written to take the place of the unedifying oral histories of the bards.

If we look upon Mr. O'Grady's book as an attempt to present in a popular form a picture of the manners and customs of the Irish prior to the English conquest, as they may be inferred from the discoveries made by archæological research, we must give him credit for consistency, care, and self-restraint in abstaining from representing impossibilities. Though the halls of the old palace are said to ring with the shouts of the warriors and the song of the bards, still the truth comes out that the so-called palace was merely a sort of wigwam of wood and wattle, entrenched within ditches and a mound. The warriors feast on salmon speared in the river, and wild geese shot on the wing, washed down with draughts of mead and metheglin and ruddy ale. The ornaments are the Celtic fibula and torc, the accoutrements the spear, the javelin, the red-yew bow, the ponderous sword, the wickerwork shield, with its bull-hide cover bossed and occasionally rimmed with metal. The heroes, with their long ruddy locks, linen tunics, and flowing brattas, are imposing only from their personal prowess. The tale is told in easy natural language; and, amid the din of war, mixing with the neighing of the steeds and the rattle of the chariots, chime in ever and anon the homely sounds of domestic life, the barking of the dogs round the "liss" or "dun," the lowing of the cows, the grinding of the quern; while the constant splashing through marshes, and struggling through brakes and woods of stunted willow, give an excellent picture of a little cultivated, half-cleared, and wholly undrained land. But then the state of semi-civilization here set forth is no proof of the early date of the events of the tale. For, though it may have begun very early, it certainly lasted very late. The description of the primitive state of agriculture and of the simple appliances of domestic life is equally applicable to the state of things found by Essex in Ulster in the sixteenth century. Though, as a rule, Mr. O'Grady is careful in his details to keep within the bounds of probability, he has certainly given too loose a rein to his imagination when he represents Dublin as containing shops with glass windows in which the goods were shown, and among those goods mechanical toys, such as a chariot with a nodding charioteer; and we should like to know what authority he has for representing chess as a game in familiar use at a date very little subsequent to the beginning of the Christian era. His book being so largely imaginative, it cannot be admitted that Mr. O'Grady has done anything towards removing from his nation the reproach that their history is as yet unwritten. It is to be hoped that the Irishman who may undertake the task will be learned enough to sift truth from falsehood, and bold enough to tear down the parasitical plants that distort the form of a tree of really noble growth. In these days of historical criticism it is as absurd for the Irish to expect other nations to accept as history a mass of clumsy fabrication that bears fable on the face of it, as it would be for the Scotch still to pin their faith on the inventions of Buchanan, or for the English to take for gospel all Malory's romances about King Arthur and his Knights. Taken as legends, there can be no doubt that the Irish bardic tales have a certain value and beauty of their own. But as that value lies chiefly in their peculiar qualities of form and diction, Mr. O'Grady would be doing good service both to Ireland and to literature if he would publish some more of these tales simply translated as literally as is compatible with being readable. By making a long-winded travesty or paraphrase as he has done with these tales of Cuculain, in which it is impossible to distinguish his inventions from the inventions of the bards, he deprives his work of the value it might otherwise have as a contribution either to the authentic or to the legendary history of Ireland.

POPULAR HEALTH MANUALS.*

MESSRS. WARD and LOCK have done good service to the public in procuring, at the hands of highly qualified members of the medical profession, a series of manuals compressing into the smallest possible space the elementary principles and practical rules of healthful living. In these tiny handbooks the non-professional reader—the teacher of youth more particularly—will find expressed in plain and untechnical language, adapted to every mind of ordinary intelligence and training, an amount of information which cannot fail to prove useful to persons of any age or condition of life; warning them against many an injudicious and dangerous habit, and, if not in all cases supplying the need of medical advice, giving many valuable hints as to the symptoms which betoken that need, and the direction in which professional counsel had best be sought. Prevention rather than cure may be laid down as the design which has been kept in view in the compilation of these little books; and it is not too much to say of them, as a series, that the shilling invested betimes in each of them may be the means of saving many a guinea. The names of the writers are not given, but the contents of the manuals themselves sufficiently attest the competence of their authors, and the hygienic rules laid down and enforced in them will be found to justify themselves in practice. The first on the list to claim our attention, *Long Life, and How to Reach It*, forms a fitting prelude to the volumes which deal with the more special functions of the organism or with separate forms of disease. Without pretending to condense into so small a compass full directions for the preservation of health and avoidance of disease in all the various conditions to which human life is subject, the writer gives plain general rules for recognizing and escaping, as far as may be, the countless foes which are ever on the watch within and without us to detect the weak spot and spring upon us with painful, if not deadly, effect. Starting from Bichat's definition of life as organization—that is, an organized body, or part of a body—in action, he proceeds to treat of health and disease as the maintenance or disturbance of healthy action. Diseases are no longer looked upon, as they were by physicians of old times, as so many separate entities, but as disturbances of perfect life, departures from healthy action, the result of some influence outside the body, or of excess or strain of some function within. Of these

4. *The Mouth and the Teeth.* London: Ward & Lock. 1880.

disturbing influences the first to be explained are heat and cold, to which that of electricity must needs be added, imperfectly as its agency is at present understood; then follow excess, privation or impurity of air, water, and food, and improper clothing. A further potent influence in the disposition to disease is to be sought in differences of race. In this country we have few opportunities of noticing the effects of this modifying element, but in lands inhabited by mixed races it is very remarkable.

In the United States, for example, the English and Welsh seem more liable to be affected with scarlet-fever, diphtheria, croup, apoplexy, and paralysis, and enjoy a comparative immunity from consumption, typhoid, and typhus fevers. Among the Irish there is a marked liability to consumption, and an extraordinary mortality from Bright's disease. The Germans show a comparative immunity from consumption, scrofula, and cancer, and a decided liability to small-pox, typhoid and typhus fevers, and other febrile affections. The Swedes, Danes, and Norwegians exhibit a greater tendency to dysentery, diarrhœa, typhoid and other fevers, with a remarkable exemption from apoplexy, paralysis, cancer, Bright's disease, and bronchitis.

The statistical tables furnished by each country form a highly important element in estimating the causes and conditions of longevity. Other modifiers of disease-producing agencies are the temperaments, of which the four generally accepted—namely, the sanguine, lymphatic, bilious, and nervous—are made clear to the reader, as are also the chief idiosyncrasies or personal peculiarities in regard to diet or habit. Hereditary tendencies come in for notice, and age, as the universal condition in the estimate of life-prospects, has its place in the list. Special chapters are devoted to the details of each morbific agent. Pure Water, and how to obtain it; Baths, and how to take them; The House, and how to build it; Food, and how to digest it; Sleep, and how to secure it; Exercise, and how to take it—are among the heads under which sanitary warnings are clearly and pithily dealt out. Under "Mental Power, and how to retain it," we find some judicious remarks upon the brain diseases now especially prevalent, with wise cautions against nervous overwork. "Parasitic Enemies, and how to escape from them," are not overlooked; and the final chapter, "Old Age, and how to meet it," sums up the little manual with valuable hints as to how the end of life, from which there is no escape, may be indefinitely stayed, and divested of not a few of its most common and distressing ills.

A subject so wide as the Eyesight, involving as its treatment does somewhat of the sciences of anatomy, physiology, and optics, is not readily to be disposed of in a manual of 134 small pages. The utmost that can be attempted within such limits is to place before the reader so much elementary knowledge as is necessary for him to understand the conditions under which the eyes must do their work, the elementary facts of the structure and functions of the eyes, and the principal dangers which beset them. The practical hints here given have reference to prevention rather than cure. No claim to be original can of course be set up, the writer's object being simply to popularize established facts and accepted theories which have become the common property of scientific men; nor has it been thought necessary to weary or distract the reader by references. The anatomy of the eye having been first explained as fully as space permits, and the physiology of vision illustrated by the aid of diagrams based upon the simple principles of optics, the writer opens up the practical part of his subject—the injuries and diseases of the eye; setting forth the uses of the ophthalmoscope, and explaining the great advances rendered possible within the last thirty years by Helmholtz's valuable invention. How to get rid of foreign bodies lodged in the *conjunctiva*, an injury very common to certain classes of workpeople, is a question which all are interested in studying. A wholesome caution is given against the use of what we learn are still sold as "eye-stones"—smooth bodies for expelling the rougher particles of cinder, stone, iron filing, or what not, that have got impacted within the eyelid. The proper article, the *operculum*, or lid, of a small sea-shell, is often, when scarce, replaced by some small seed, as a bean or flax seed. A patient has been admitted into a hospital, her eye disclosing a germinating seed, with quite a well-developed sprout, having been liberally fed by the local warmth and the tears of suffering. For a very common and dangerous form of injury—a splash of lime into the eye—bathing with dilute vinegar, or with sweet oil after the lime has been washed out, is a simple means of giving relief; and, in the case of injury by acids, one part of lime water to three of water is a safe expedient, or the eye may be freely bathed in milk. Ophthalmia in its manifold forms is succinctly treated in the manual before us, from that in which sympathetic inflammation threatens the uninjured eye (when the removal of the offending organ is almost always the only safe course), to the catarrhal and purulent forms, which are to be carefully distinguished by the simple rules here laid down, and checked betimes by expedients which may obviate the need of surgical care and tedious treatment. In another chapter optical defects, including old-sight, long-sight, short-sight, and astigmatism, are discussed, sundry popular errors corrected, and grains of comfort dispensed to many people who are worried by nervous fears of their infirmity being beyond cure, whilst timely advice is given for the detection of defective or failing power, and the relief to be found from properly rinsing the eyes as well as from artificial aids to vision. Plain rules for the choice of suitable glasses follow. The last chapter, upon the effects of school life, forms the most original part of the book, furnishing many a hint as to the precautions that should accompany a course of training which is necessarily artificial and to a certain extent unnatural. The proper lighting and ventilation of school-rooms, the avoiding of undue or over-continuous strain upon the sight, the adjustment of work to the power of vision, whether long or short, the selection of clear print, the shape and size of the desk, and its relation to the seat—such points, prominently brought to the front by the exigencies of modern education, are here treated with an amount of clearness and common sense which of itself commends the book to the use of every elementary teacher.

In *The Throat and the Voice* the reader is prepared for the practical lessons to which the little work is mainly addressed by a short chapter on the general construction of the throat, made clearer by a diagrammatic anatomical sketch of the throat and adjoining structures, in vertical section, indicating the course of the air and food tracks, for which the pharynx forms the common highway. The process of respiration, which, with that of vocalization, is the subject to be illustrated here—that of alimentation coming under another department of the series—is thus made clear to the reader, who is taught to carry further the same line of anatomical study by examining his own throat by the aid of a well-illuminated mirror, such a one more especially as he may hold in the hand, turning the light upon each separate portion under view. He will thus be prepared to understand the various forms of disease to which each part is liable, as well as the rules to be observed for keeping it in its healthy state and normal action. The causes of sore throat, that most common and not least distressing of minor maladies, with the precautions to which they point, are summarized within a few pages, which, carefully laid to heart, might be the means of obviating an amount of misery not easily to be calculated. Besides simple rules for all classes and sexes, specific warnings are laid down for those who by necessity or propensity are exposed to ills of their own. Hereditary predisposition to throat complaint, exposure to atmospheric extremes, imprudences and excesses of various kinds, come briefly within the writer's notice. The peculiar condition of the throat known as the "milky patches of smokers," often simulating an unfortunate constitutional form of sore throat, is traced to unwise and ill-regulated indulgence in a habit which, above most others, has its slaves. Inordinate use of iced water, as well as of alcoholic liquors, is shown to affect the throat. Follies of dress, unnatural straining of the voice in loud talking, screaming, bawling to the deaf, and so on, come under view, and remedies are suggested in the way of freedom of exercise, proper methods of taking breath, elocutionary practice, and vocal gymnastics. For acute sore throat, quinsy, and diphtheria, as well as for the forms of sore throat connected with small-pox, measles, and scarlet-fever, a few simple directions may be useful at the initial stage, but the right thing will always be to fly forthwith to the best professional advice to be had. Parents and all persons in charge of children may beneficially keep in mind the plain rules laid down for the detection of the early symptoms of croup, enlarged tonsils, and other affections to which youthful throats are specially liable, and for giving prompt succour when foreign bodies lodging in the windpipe or gullet cause sudden alarm. The second half of this short manual treats of the throat as a vocal organ. Diagrams are given of the exterior and interior structure of the human larynx, fig. xi. in particular showing well an image of the whole vocal apparatus as seen in a mirror held far back in the mouth. Again, the action of the larynx is to be seen as contrasted in respiration and phonation, when the voice is given either from the chest or in what are known as head tones. For a sound method of vocal culture, the beginner had best set himself to practice at once under a good master. Written rules can do little for him beyond inculcating right habits in such simple matters as taking breath, sparing the lungs, and avoiding unnatural strain, artificial utterance, indistinctness or hastiness of speech. A good system of vocal gymnastics is indispensable. The most common defects of voice, whether as regards speaking or singing, are pointed out in a way that will make this little manual of much practical service.

There are few facts in physiology more generally attested by popular experience, as well as by the consensus of professional practitioners, than that of the progressive deterioration in the teeth of the civilized races of mankind. Whether this is due to general causes affecting the constitution, such as the increased strain upon the nervous centres involved in modern social habits, or to special faults of dietary—the less ample supply of milk, especially in childhood and youth, the substitution of white for whole-meal bread, entailing the loss of the phosphates and silex—is a problem full of interesting matter for speculation. More pressing still is the question how to make the best of the outfit of teeth which each one among us has inherited, or finds still at his command. Dental caries being undeniably on the increase, recession of the gums and absorption of the supporting alveolar processes being fearfully prevalent even among the young, it is of the utmost importance that some popular knowledge should be available to check betimes this premature decay and loss of teeth. Much can be done by intelligent care to avert that resort to tooth-drawing which becomes too often the only refuge from the penalties of criminal neglect. Not only is the loss of masticating power here involved, but facial deformity, abscesses, neuralgia, dyspepsia, headache, and troubles of eye and ear are morbid conditions frequently to be traced to the same cause. After explaining in popular terms the anatomy of the mouth, the eruption of the temporary and the permanent teeth, and the natural composition and nutrition of the teeth generally, the writer passes on to the nervous relations of this delicate apparatus, the disturbances to which it is subject or which it may induce, affecting the entire

organism. Besides caries or decay, there may be latent dental disorders, such as exostosis, or enlargement of the roots, deposits in the pulp-cavity of a tooth, or local pressure of some kind which may be reflected to the eye, the ear, or other organs, inducing a general derangement of health. Sympathetic or reflex disturbances of this kind, caused by dental irritation, form a subject of careful study for the physiologist and the physician, and the proper treatment of them calls for more than the mere technical skill generally looked for in the dentist. The way in which they are treated in this little book shows that the writer takes the widest view of his profession, and will justify the confidence he claims from his readers. The practical rules he gives for the care and preservation of the teeth are sound, and will be found to be based upon scientific reasons no less than upon extensive practice. His system of dentistry is eminently conservative in character; and, while speaking in severe language of extraction as too often a sign of ignorant impatience on the part of the sufferer and want of resource and method on that of the dentist, he does all that good and kindly advice can do towards aiding nature in the retention of one of her most precious gifts.

THE PAST IN THE PRESENT.*

FEW more interesting archæological works have lately been published than the ten "Rhind Lectures" which make up Dr. Mitchell's volume, *The Past in the Present*. We do not agree with what we take to be the conclusion of Dr. Mitchell's arguments, nor can we think that his ideas are so novel as he seems to suppose. He is continually arguing against some invisible opponent, who appears to be the ideal type of the untrained archæologist. He points out that, if certain modern Scotch survivals of barbaric or savage culture, such as stone whorls and rude pipkins, could be buried and dug up again, they would be falsely attributed to a remote antiquity. But Dr. Mitchell may be easy in his mind, for archæologists worthy of the name now take into consideration every circumstance of a "find," and it is their rule to date no grave further back than the most recent of its contents. But though we may have to dispute Dr. Mitchell's conclusion that perhaps "there never has been a time in human history when there did not occur among men states both of high and low civilization," we must thank him heartily for the manner and the method of his book, for the curious and valuable facts which he has collected from personal observation, and for the admirable woodcuts which adorn as well as illustrate his volume.

Lecturing in Edinburgh on archæology, Dr. Mitchell has chosen Scotch examples of rude and ancient habits, and scarcely introduces a fact which he has not observed with his own eyes. The results are really surprising. Most archæologists know that many ancient and simple usages survive in Scotland. Mr. Tylor had already described the old Islay woman who spun with a potato stuck on her spindle by way of whorl. That clay pipkins are made by women in the Hebrides without the aid of the potter's wheel, and ornamented merely by scratches of the finger-nails, was also well known. But Dr. Mitchell has added dozens of instances of similar survivals, and has satisfactorily shown that, so far as the material appliances of life go, many of our Scotch countrymen are now living in a manner scarcely superior to that of the Admiralty islanders. Yet Dr. Mitchell avers that the Shetlanders and people of the Lewis, who dwell in a kind of earthen bee-hives, who spin with instruments like those found in Dr. Schliemann's Troy, who wear shoes cut from the untanned hairy hide, and drink sour milk out of the rudest sort of clay-pot, are not much lower than their neighbours in all that makes civilization. They are intelligent enough, and sometimes are keen theologians; they use Sheffield cutlery (when they can get it), and Manchester stuffs; but they are satisfied with many of the rough instruments which savages employ. To tell the truth, these worthy Highlanders are abominably lazy, and their motto is, "it will do well enough." As a consequence, even the rude articles of their manufacture are degenerate. The first simple appliances and utensils were better made when all the Northern world used them; when they were more or less elaborately decorated for rich men and chieftains. Now that the old-fashioned brooches, pots, spindles, and even the bee-hive houses only exist to satisfy the humblest wants of the most lazy and indifferent people, these pots, brooches, spindles, and hovels are degenerate, are made in a clumsy, slovenly way. From these facts, which we state for the present in the broadest manner, Dr. Mitchell seems inclined to argue that degeneration has been a more common element in human history than we are disposed to believe. As intelligent people in Shetland and the Lewis use some of the typical instruments and processes of savagery, he draws two inferences. First, savages, and the early people whom geology reveals to us, may be and may have been quite intelligent, anything but apelike, and so far the Court is quite with him. Secondly, as the Shetlanders and the rest use degenerate instruments, and as they coexist with Scotch people completely civilized, so, too, savages, contemporary or prehistoric, may have been degenerate, and may have coexisted with people completely civilized. The conclusion would be that already quoted: "There may never have been a time in history when there did not occur among men states both of high and low civilization."

But, surely, to adopt this view is as much as to say that the original high civilization was conferred by miracle. Whence came the first civilization except by way of inventions and improvement, which must have been preceded by indigent savagery? Dr. Mitchell is doubtless aware that there are races which have, or had, no pottery, which have not even attained to the curious art that prevails among tribes to whom real weaving is unknown, and who possess no cultivated cereals, and scarcely any domesticated animals. Are these races "degenerate"? Is Dr. Mitchell acquainted with any race which has gone back from the use of the spindle to hand-twisting, from lucifer matches to the fire-stick, or from writing to knot-tying, or from metal to stone knives? This is the kind of degeneration which it is necessary to prove, as against Mr. Tylor's theory that human progress, "in spite of frequent stops and relapses, has been, on the whole, forward." That theory must be wrong, if, contemporary with, and in the neighbourhood of, cave-man and the early flint-chippers of the Drift, there existed people as well-equipped as we are well-equipped in comparison with Shetlanders. And, if such civilized people did exist, where are their remains? We may say that there are no known relics of former art and handicraft, to which we cannot assign an historical and comparatively modern origin. They are Egyptian, or Babylonian, or Etruscan, or Phœnician, or belong to the dim empires descried in the background of American civilization. The gold work and the artistic pottery of these early civilizations are abundantly represented; but where is the gold work or artistic pottery of the civilized persons contemporary with the owners of the Drift or Quaternary deposits? We are perfectly willing to grant that the artists who chipped the beautiful flint arrow-heads may have been "potentially" as good men as Benvenuto Cellini. We are convinced that the highest civilization has its frequent "survivals," just as the finest streets have the lowest slums behind them and about them. But we cannot believe in a primitive civilization ready-made from the beginning. Even if geological evidence, and the evidence of artistic remains, bore out such an opinion, the irrefutable evidence of institutions looks the other way. Where is there a people, Aryan or Semitic, without traces of Totemism, of the undeveloped family, of the blood feud, of fetichism, of polytheism, in its religion, law, and domestic life? Where is there an example of a civilized race degenerating into Totemism? On the whole, the testimony of institutions makes it abundantly evident that progress is the rule and the law, degeneration the exception, among races fitted to survive. The descendants of the old Egyptians are degenerate in art, but in religion they have ceased to be Totemists.

We have devoted too much space to Dr. Mitchell's general ideas, too little to his most interesting collection of facts. His early chapters show how much of what is called the "stone age" survives in Scotland. By the way, do antiquaries who regard the "stone" and the "bronze" and "iron" ages as definite, mutually exclusive stages in human culture, with sharp, distinct boundaries, still survive in Scotland? From Dr. Mitchell's frequent cautions we infer that they do. In his brief sentence on the introduction of bronze, he might have noticed the interesting earches of Lenormant. In his book are pictures of spindles with .tone whorls, of "knocking stones" of clay, "craggans" rougher than the pots Mr. Greenwell finds in early barrows (pp. 26, 27); here are "querns" for grinding corn. Still more amazing, to Southrons, are the sketches of "black houses," in which the islanders pig together, and of the "bothans," or beehive houses, now only used as "shealings," or huts for the people who tend the cattle in the summer pasturages. These are "dwellings in the structure of which neither wood nor iron nor cement has been used." In 1866 there were still "cave-men" living in the great cave at the south side of Wick bay. These people were tinkers, and existed in singular squalor. But if the cave were to fall in and cover them, they would not be dated by antiquaries as contemporary with the cave-men of Mentone. For the tinkers would leave no stone arrow-heads and no bone daggers, while their own bones could not be mixed with those of hyænas, reindeer, and cave-bears. Dr. Mitchell draws the conclusion that the "cave-dwellers of a nation may exhibit a degree of degradation which may not be exhibited by the nation of which they form a part." If so, where are the learned and accomplished Dr. Mitchells of the nation to which the cave-folk of Mentone belonged? Where are the remains of their industry, archæological and medical? where are their spades, pickaxes, microscopes, lancets, and spectacles, contemporary with cave-bears, mammoths, and rhinoceroses? They are no more to be found than the flint arrow-heads and fossilized stone daggers of the Caithness tinkers. Show us a stethoscope or two in the Drift, and a few stone arrow-heads in use among the Caithness tinkers. Till these objects are produced we remain of the opinion that the crowned cave skeleton of Mentone was an early aristocrat, while the Caithness cave-man is a degenerate cadger. But we understand that Dr. Mitchell intends to "institute a comparison between the present cave people of Caithness and those who dwelt in the caves of the Dordogne when the mammoth and reindeer existed in France" in a future course of lectures. He may then, perhaps, produce some remains of the advanced civilization which coexisted with the mammoth in France.

Perhaps the most astonishing of the survivals in Dr. Mitchell's book is the "rivlin," or shoe of untanned ox-hide, which is still worn in Shetland (p. 93). "There is probably no older or ruder form of shoe known. It appears in the tombs of Egypt, and it is inferior in design and execution to the mocassin of the North

* *The Past in the Present: What is Civilization?* By Arthur Mitchell M.D., LL.D. Edinburgh: D. Douglas. 1880.

American Indian." John Elder named them, in 1542, as among the tokens of Scotch savagery. Scarcely less odd than the "rivlin" is the savage Scotch mode of boiling water by putting red-hot stones in the pot. Even a North American Indian tribe, on seeing the European plan, gave up the Scotch trick, except for boiling meat in the sacred festivals. In just the same way the Jewish rite was performed with a stone knife, after the people used metal knives for non-ritual purposes.

Passing from instruments to usages, Dr. Mitchell illustrates Northern civilization by the fact that the people "yird quik coks," or bury live roosters on the spots where epileptic patients fall. They "owe a cock to Asclepius." Fire is carried round fields, houses, and boats on the last night of the year. Less than two hundred years ago bulls were sacrificed to "St. Mourie" on an island in Loch Maree. The saint is still sometimes spoken of as "the God Mourie," and probably the saint succeeded to the rites and dues of some early deity. Wells are still adored "from John o'Groat's" to the Mull of Galloway. In short, Bible-loving, Protestant, Free Kirk, U. P. Antiburgher Scotland is in a perilous state. It is curious to note how compatible are Liberalism and savagery. Possibly the people near Loch Maree will sacrifice a hetacomb of bulls in honour of the recovery of Mr. Gladstone. The worthy and drouthy Scotch still quaff water out of the skulls of suicides, and taste the blood of murderers. "I have known epileptics so treated," says Dr. Mitchell. Yet the Scotch send flogging missionaries to Blantyre in Africa, and the "schemes of the Kirk" still include the conversion of the heathen. Would researches like those of Dr. Mitchell reveal similar depths of cannibal superstition in England?

PIOUS FRAUDS.*

THE wisdom of the Elders—in this point, perhaps, rather a dubious wisdom—used to hold that love often comes with marriage. Mr. Albany de Fonblanque apparently holds that love may sometimes come with engagement. His heroine, May Fairfax, is a young woman who, for about half the book, deserves very fully the title of an adventuress, and, if her designs are not altogether inconsistent with the principles of Mrs. Grundy, it is that she has much too sharp an eye for the main chance to allow herself to drop into the number of the "disclassed." Fortunately, however, the Dawn of Love comes at the fifty-second page of the second volume, indicated affectingly by "an unwonted tinge of melancholy and a glint of something else about the violet eyes," and thenceforward all is well. But it must be admitted that Mr., or Sir Arthur, Bellmonte, was a lucky man, all the more that he does not seem to have had the least suspicion of the young woman's state of mind either then or afterwards, till she confessed it some considerable time after her marriage. The Dawn of Love, by the way, would not have been at all a bad title for the book, whereas its actual appellation is one for which we have in vain striven to find the least reason in the story. For, although there are several frauds in Mr. de Fonblanque's volumes, we must say that we cannot for the life of us see the piety of them.

The author has succeeded in inventing or discovering a rather good legend as a base for his plot. The Bellmontes are an ancient —and certainly an oddly named—family, whose fate is mysteriously bound up with certain relics of their ancient abode. These "sinking stones" have a habit of disappearing in the earth, one at a time, when the head of the house for the time being dies, and nervous Bellmontes accordingly watch them with considerable interest. The excitement occasioned in the mind of one such person by the fact of a heavy man sitting down unawares on one of these uncomfortable fragments of masonry is an incident not badly imagined. But we cannot say much for the company Mr. Albany de Fonblanque has got together to perform his piece. Of one of the heroines we have spoken; the other, for there is another, is her cousin and exact opposite. Sibyl Cowper is dark while May is fair, and melancholy while May is cheerful, though she has been favoured by nature with a nose "which laughed all by itself." The effect, we are told, was wonderfully fascinating, and perhaps it was, though doubt on the point may be pardoned. The young lady with the nose that laughed all by itself naturally did not feel called upon to do much laughing on her own account, and fate gave her very little occasion to do any. With greater obedience to fact, perhaps, than to the laws of poetical justice, Mr. de Fonblanque, having accommodated his designing, and at first very unmaidenly, blonde with a capital example of the amiable and honourable dunderhead, has provided the deserving brunette, not merely with a nose that laughed by itself, but with a most offensive scoundrel of the clever order for a partner. Mr. Norman Drummond is a man of good family and of distinction at school, at the University, and at the Bar, but apparently also a snob and a rascal. He entangles himself in a Scotch marriage, which is not a Scotch marriage, with Sibyl, and then endeavours, first to back out of it and then again to back into it, in a manner which is sufficiently rascally and snobbish, but which lacks the advantage of being probable. A man like Norman Drummond, bent on making his way in the world, would certainly not have been fool enough to think that a pretty and ladylike wife, even if she had no fortune, would be a greater hindrance to his career than a story all the facts of which were known to persons of position and influence, and which, if told against him, would infallibly in those days send him to Coventry for a long time, if not for ever. Besides this quartette we find in the novel some bewildering Bellmontes, who call themselves by other names; a terrible ruffian of a Trades-Union agitator, who seems to have been well born and to have mixed in good society for a great part of his life, but who talks as if he had invariably been a small shopkeeper; a diabolical woman who mends lace, wife of one of the bewildering Bellmontes, and mother of an epileptic child, who is another of the clan. The acuteness of May Fairfax, or May Bellmonte, as she soon becomes, and the woes of Sybil, supply the chief substance of the story; but a good deal turns on an unknown heir who, for reasons which are rather mysterious, and in a manner which is more mysterious still, lives in the character of a poacher on the lands which he has only to speak in order to make his own, behaves with a curious mixture of swagger and humility to his associates of all ranks, and, in short, is generally incomprehensible, which, it may charitably be supposed, he is meant to be. This person, who is the father of Sybil—everybody in *Pious Frauds* is the long lost father, or sister, or cousin of everybody else—is overwhelmed in company with most of the sinking stones by a landslip in a picturesque and effective, but rather melodramatic manner, and his decease causes many revolutions and discoveries of the orthodox kind. There are, in fact, in *Pious Frauds* the elements of an interesting book, but they are not well put together, and the character-drawing, of which it may safely be said that in a novel *extra hanc nulla salus*, is extremely inadequate.

By far the most remarkable things about the book, however, are the extraordinary abundance of solecisms of all kinds which is to be found, and the bewildering nature of the set pieces of eloquence in which the author occasionally indulges. The volumes open with a rather Arcadian meeting between the two heroes and the two heroines, a meeting the conditions of which not unnaturally shock the precise Drummond. He and his newly-found friend and cousin, Arthur Bellmonte, are staying, the one in quarters, the other on circuit, at York, which Mr. de Fonblanque, according to a rather senseless affectation common with novelists, calls Minsterton, the chief town of Ridingshire. Bellmonte has enticed Drummond on the river apparently for an ordinary row and some way up the bank they come upon the two damsels, obviously by appointment. In the twenty pages or so which describe this assignation, Mr. de Fonblanque has contrived to scatter some exceedingly choice flowers of novelists' English and other tongues. The spelling "huzzar" is, to say the least, not common nowadays, and it looks a little as if Mr. de Fonblanque was vacillating between "hussar" and "huzza." Mr. Drummond condescendingly remarks to May, "You understand French, Miss Fairfax," and it is probably her answer, "A little," which emboldens him to talk to her about the "carte *de* pays." The huzzar—perhaps after the manner of his singular kind—remarks that "the beauty of a big boat is that you can lay down in the bottom." Mr. de Fonblanque himself is not behind his creations for he shortly informs us that the two girls had "a struggle against fate in their glove and boot departments and a rococo atmosphere about their hats." We do not know that we remember a more admirable example of the sorrowful chances which attend the determination to be brilliant by means of the avoidance of plain speaking. Mr. de Fonblanque, however, has by no means exhausted his talent for deranging epitaphs in this remarkable sentence. He tells us elsewhere of one of his villains that "he found a small world he could grind and a flock of black sheep he could lead by the nose." The leading of black sheep by the nose is something quite new in the pastoral line, and deserves a brand-new idyl from any modern Theocritus who may have leisure to turn one out. Yet again our author has a fine inspiration when he remarks, "Her face was her fortune and she put it to bank in her brains." The operation is complicated and would demand a delicate hand in a surgeon, but it is interesting to know that this young lady did it. When Mr. de Fonblanque speaks of "spicy paragraphs" signed "Atlas" out of a fashionable *Scan. Mag.* we can only conclude that he thinks those syllables are short for scandalous magazine. A pleasant glossary then suggests itself. Crim. con. doubtless means Crimean conundrums, and we should not be surprised to hear that Fid. def. was a compound of French and English, and meant "fiddling forbidden." When the reader hears that one of the characters addresses her husband as "Dawkins," he will naturally suppose that the speakers belong to the lowest middle classes; but it seems that this form of address is used by ladies belonging to the first families of these kingdoms. A passage in the third volume may be commended to any scholiast of talent who wants something to interpret. One of the minor characters, it seems, had taken to entertaining persons of loose morals once a week. "Drummond had only," we are told, "assisted once before at these meetings, and had then left early, not at all pleased with his company or the means provided for his entertainment. And he left unrequited. 'A stuck-up cad,' said the men." From which we gather that a person who goes away under these circumstances "leaves unrequited," which certainly requires a new entry in the dictionary under the verb "to requite." This neologism can be paired with another still more surprising in the use of the word "sex." A woman has hired two other women to play the spy on her husband. "Jealousy was the

* *Pious Frauds.* By Albany de Fonblanque. 3 vols. London: Richard Bentley & Son. 1880.

excuse given," says Mr. de Fonblanque, "and in this cause her charming sex listened and spied with delightful activity." The list of these eccentricities may be appropriately concluded by informing the reader that the author of *Pious Frauds* thinks that an anabasis is the same as an exodus. A gamekeeper has been dismissed, and Mr. de Fonblanque talks of what has happened "since the anabasis of Jones." Now there is nothing to inform us that Mr. Jones had gone up the country, or that he had been promoted, or that he had retired to another and a better world. We are, therefore, forced to conclude that our author has not the least idea what anabasis means, and considers it as synonymous with departure. It would, however, be unfair, after pointing out Mr. de Fonblanque's shortcomings, not to give an example of what he can do. His turn for the ornately and imaginatively descriptive has been already indicated to the discerning by the quotation about struggling with fate in a boot department and about the rococo atmosphere which surrounded Miss May Fairfax's hat. But he can keep it up if he tries, and is by no means limited to a chance phrase or two, as for instance:—

We pile up a mountain of good resolves laboriously, stone by stone, we swear that it ought to endure and therefore that it shall endure for all time standing between us and the Sunny Valley where Prudence has set up its *no trespass* board, and lo we stumble upon a pebble of the brook on which we read *excuse*, and straightway it grows bigger than the mountain, and flies at the mountain, and breaks it down, and smashes up the trespass board, and paves us a beautiful macadamized road straight into the heart of that valley.

This is something like a *carte de pays*, as Mr. de Fonblanque or Mr. Norman Drummond would say. The conduct of the pebble is indeed a little bewildering, and the brook is introduced without due indication of its previous whereabouts. But a sermon in stones of this kind ought not to be criticized too narrowly. It will be better to give another example of Mr. de Fonblanque's surprising parabolic faculty, and then to have done with him:—

He did not misjudge or overestimate May's opposition. With a woman's quickness she suspected the security of this change of front, and, womanlike, she would not let him imagine that he was deceiving her. This, my dear Madam, is one of the few mistakes which your charming sex habitually commit. When a lord of the creation sets a trap for you, you sing out, "*It's a trap! I see it! Come, dears, and look at the trap!*" You should pretend not to know it's a trap, hop playfully round and round it, and over it, and on it, letting him think that the next hop will be *in* it. Or else, being a brute, he'll out with his gun, slip in a No. 4 cartridge, and over you go. This requires a good deal of self-denial. It is hateful, I own, to be clever and not show it. But, believe me, your sacrifice will be rewarded.

It is certainly not every novelist who can give such good advice in such a charmingly figurative and Eastern manner.

NEWTON'S ARCHÆOLOGICAL ESSAYS.*

THE expectations which were raised by the announcement of a forthcoming volume of archæological essays by Mr. C. T. Newton of the British Museum are doomed to some disappointment. Mr. Newton's reputation as one of the highest living authorities on Greek art and antiquities will not suffer by the work he has just published, but, on the other hand, it will not be raised. It was natural to expect something more original from one who has spent a long life in the study of Hellenic monuments, from the days when he worked under Dean Gaisford at Christchurch to the visit he lately paid to Professor Curtius's expedition at Olympia; it was impossible not to hope great things from the collected writings of a man whose name is associated with the discoveries of the Mausoleum, of Cnidus, Halicarnassus, Branchidæ, and Ephesus, who has closely watched and assisted in the great progress of archæological study during the past forty years, and, above all, has long held the guardianship of the Greek and Roman section of our national collections, of which he justly boasts that it has no equal on the Continent—a boast which owes its truth in a large measure to his own efforts. Nevertheless, all that Mr. Newton has given us in his new volume is a lecture, a letter, some contributions to the monthly magazines, and half-a-dozen reviews. They are all worth reading, and all possess the authority which attaches to every judgment or theory which Mr. Newton utters on his special subject; but they are neither so wide in range nor so original in matter as we had hoped to find them. Even taken in conjunction with the same scholar's *History of Discoveries* and *Travels in the Levant*, the bulk of these writings shows a strangely small literary productiveness in one who is, and has long been, master of his subject, and may be supposed to have some desire to help others up the ladder he has himself ascended. With the exception of the introductory lecture and a letter to a Select Committee, the articles forming the present volume were all written during the last six or seven years. Like the Seven Sleepers of the city whose history he relates with such perspicuity, Mr. Newton seems to have slept, in a literary sense (save for his volumes of travels and discoveries in the Levant), for a period of twenty years, after which he shook himself together and took to the writing of reviews and memoirs. It is thus that the greater part of the present volume deals with the discoveries of the past decade, and that we hear next to nothing of the earlier triumphs of archæology, whose history Mr. Newton could so well have written. Nor do we find here any account of the treasures over which the author stands sentinel in the British Museum. There are many incidental references to them, and full descriptions and criticisms of a few examples in one section; but the Greek statuary of the national collection as a whole—Mr. Newton's special charge—is nowhere discussed or explained. Those who have heard Mr. Newton's lecture on the Parthenon, which he has given, we believe, several times, know how clearly he can interpret the meaning of the precious fragments of the Elgin Room, and how different becomes the pleasure and the instruction of a study of this gallery after having the contents explained in its Keeper's lucid manner. Mr. Newton has delivered many lectures besides that on the Parthenon, and in all he has shown, not only the clearness and logical sequence which are so apparent in his written articles, but also a freeness and felicity of expression which are unfortunately not equally conspicuous in the latter. None of these lectures on the Greek treasures in his keeping appear in the volume before us. Possibly they were not taken down; and, if so, we can only lament the misfortune. Perhaps the course of lectures on Greek archæology now being delivered by him at University College will gather up the substance of all former lectures on the subject; and these at least will, we hope, be published. Meanwhile the fact remains that Mr. Newton's most successful mode of instruction is only represented by a lecture delivered in his youth, and that none of the many discourses which he has addressed to the Royal Institution, the public schools, the Men and Women's College, and other audiences, with reference to the beautiful works of art among which his daily life is cast, find a place in this volume of his collected writings.

But the absence of the most generally interesting portion of Mr. Newton's labours must not diminish our gratitude for what he has given us; and in any case it must be owned that the daily departmental work of the Museum may well explain omissions which we cannot help regretting. Although the greater part of this volume consists of papers which are within the memory of the youngest art-student, it is yet convenient and useful to possess them in a collected form; and there are two exceptions to the lateness of the date which will be welcomed with pleasure. These are the Lecture on Archæology, which opens the volume, and the Letter to the Select Committee on the National Gallery (1853), which is a natural sequel to it. The former, which was given at a meeting of the Archæological Institute at Oxford on June 18, 1850, is, in spite of a certain youthfulness and a somewhat over-rhetorical style, perhaps the best thing Mr. Newton has ever written. It is a clear and eloquent exposition of the subject-matter of archæology, a singularly successful attempt at co-ordination. The various studies which come under the head of archæology are treated slightly but sufficiently, their place assigned, and their relations to the other branches of the same great subject explained. The whole *rationale*, the objects, the divisions, of archæology are here set forth and arranged with a lucidity of treatment and a breadth of grasp which have perhaps never been excelled. As an introduction to the study of antiquities in the widest sense this lecture stands by itself; and to have rescued this from the oblivion of an old number of the *Archæological Journal* is alone a sufficient *raison d'être* for the volume before us. The letter to the Chairman of the Committee on the National Gallery, to protest against the proposal to disintegrate the antiquities in the British Museum, is a fit sequel to the lecture on archæology. It takes up the same line—the defence of archæology as a whole, indivisible, and depending on the juxtaposition of its parts; only in the letter the national collections are specially regarded, whilst the lecture extends over the whole range of archæology from the most cosmopolitan point of view. In both, clearness of arrangement and the force of apposite illustration are conspicuous.

Of the rest of the articles, all of which were written since 1873, half are reviews of works which have appeared in recent years on archæological subjects. Students of the past will be glad to read Mr. Newton's opinions on Wood's discoveries at Ephesus, Schliemann's at Mycenæ, and Curtius's at Olympia, as unfolded in the pages of the *Edinburgh Review*; and his views on the researches of Mr. Lang and General Cesnola in Cyprus, and on the value of Greek coins as a commentary on Greek sculpture, will be read with interest by those who have not already made themselves acquainted with them on their original publication, or who did not accord to an anonymous writer the attention with which they would have listened if the hand had been known to them. In all these reviews we find the same clearness and logical arrangement which are noticeable in the lecture on archæology, though we miss the enthusiasm and eloquence which add so much to the charm of the spoken address. After all, for the exposition of archæological facts, accuracy and clearness are more essential than charm of style and the music of well-balanced periods.

Besides these reviews, there are two sets of articles in the book which are real acquisitions to the literature of archæology. We could do very well without the solid *Edinburgh Review* articles, as we have the grounds upon which they rest; and, though it is an advantage to know Mr. Newton's opinions of the various books reviewed, and to have their results arranged and epitomized for us, it would be quite possible to content ourselves with the books themselves. This remark does not apply to the series of papers on Greek inscriptions, nor to the two articles on Greek sculpture from the west coast of Asia Minor, to which the interesting essay on the Cimmerian Bosphorus forms a sort of pendant.

* *Essays on Art and Archæology.* By Charles Thomas Newton, C.B., D.C.L., &c., Keeper of Greek and Roman Antiquities at the British Museum, Correspondent of the Institute of France. London: Macmillan

These papers represent an immense amount of independent study and wide archæological experience. No one better than Mr. Newton, unless it were Böckh himself, could claim for Greek inscriptions the importance that really attaches to them as elements in the history of Greek art and Greek life in general; and the articles on this subject contributed in 1876 and 1878 to the *Contemporary Review* and the *Nineteenth Century*, though necessarily including a large proportion of dry detail, possess a peculiar interest in the vivid light they throw on the political and religious, and in some measure the social, life of the Greeks at various periods of their ancient history. From the inscription at Abou-Symbel, six centuries and more before Christ, to the edict of Diocletian, A.D. 301, Mr. Newton surveys the whole field of Greek inscriptional monuments, and deduces from them all that can be learned of the people whose laws, or deeds, or creeds they commemorate. We are inclined to rate the articles on Greek inscriptions, which occupy one-fourth of the volume, as the portion of most permanent archæological value therein. They call attention to a branch of antiquities which is little appreciated, and the difficulties of which, moreover, make the aid of a guiding hand very necessary. To understand and interpret, not merely read, Greek inscriptions is a gift which only comes after many years spent in Hellenic studies. To most scholars they present more obstacles and pitfalls than information, and we must be very grateful to Mr. Newton for having presented so difficult a subject in so popular and intelligible a form, and for having invested what most students regard as a dreary study with the interest which can only come from a comparative treatment, the hard-earned result of a life's patient labour.

The essay on Greek sculptures from the coast of Asia Minor is a very charming survey of the progress of discovery on the west coast and in the islands of the Archipelago. Grouping the various sculptures into periods of art, Mr. Newton arranges in the different classes all the more remarkable objects which have been discovered in the part of Asiatic Greece selected for discussion. The whole study is an excellent example of Mr. Newton's method, and has more style and life about it than any of his later articles. It has besides the advantage of treating of objects which are contained in the national collection, and are consequently more familiar to English students than, for instance, the remains of the temple of Olympian Jove (despite the exquisite cast of the Hermes of Praxiteles now exhibited in the Elgin Room) or the "pre-dædalian" relics of Mycenæ. The account of the sculptures from Cnidus, especially the exquisite Demeter, ought to be read by every visitor to the British Museum who knows the way through from the Græco-Roman Gallery to the Elgin Room. As a specimen of delicate art criticism, too, the short extract from the *Times* on the celebrated bronze head of Venus from the Castellani Collection deserves a word of notice. If Mr. Newton had given us a little more of this sort of work, more of his own deductions from the Greek monuments and less of reviews of books, there would be little room for criticism.

RODD'S BIRDS OF CORNWALL.*

IT is more than a century since Dr. Johnson, in reviewing Borlase's work on the Scilly Islands, drew special attention to the value of such "pleasing and elegant pieces of local inquiry" as were then just beginning to be produced in various parts of the country. It would be difficult for the historian of natural history to overestimate the work done in this quiet field of "local inquiry" by patient and instructed observers. The very temper of mind fostered by a country life, the repose, the leisure, the unwearied eye, all these give a peculiar advantage to the local naturalist, and tend to make his experience trustworthy and ripe. In the field of ornithology no provincial collector of our generation has deserved more commendation than Mr. Rodd, the result of whose labours—unfortunately posthumous—lies before us. His life was one of the most quiet that can be imagined. He was born at the rectory of St. Just-in-Roseland, close to the cliffs of Cape Cornwall; he began life as a solicitor in Penzance, and rose to one municipal post after another, without once desiring to spread the field of his ambition beyond the little peninsula in which he was born. His chief, if not his only, recreation seems to have been wandering over his native county in search of birds. In the course of a life that closed last January in his seventieth year, he not only greatly enlarged the list of the recognized birds of Cornwall, and reduced its avifauna to a scientific precision, but he added to the list of known English birds several very important species. Until he found the spotted eagle on the moors around Hawk's Tor, in 1860, that noble bird was unknown to British naturalists. The red-breasted flycatcher, a lovely little creature that apes the robin in its plumage, had never been observed in England until a friend of Mr. Rodd's watched it skimming the grass for flies at Constantine, near Falmouth, and set the eager ornithologist on the track. The lesser grey shrike (*Lanius minor*) was first described by Mr. Rodd, and the same may be said of another curious little bird, the American stint. But it is not necessary to multiply instances of research which will occur to the memory of every ornithologist, and which the modesty of the author can no longer conceal. We should add that the present work, of which only a few sheets had been corrected at the death of Mr. Rodd, has been carried through the press with much care and sympathy by Mr. J. E. Harting, himself favourably known in the literature of ornithology.

We are doubtful whether it is to Mr. Rodd or to Mr. Harting that we owe an entertaining introduction of a bibliographical character, in which the patient research of the writer has been employed to find out all that has been said by early annalists on the birds of Cornwall. From the *Itinerarium* of William of Worcester, we learn that Tresco, or, as the old monk calls it, Rascow, in Scilly, was famous even in the fifteenth century for its puffins, being, as he says, "inculta, cum cuniculis et avibus vocatis *pophyns*." The puffin is at present rare in all parts of Cornwall, except the Scilly Islands, where it breeds on the cliffs in immense numbers. John Leland, half a century later than William of Worcester, noted the same abundance of "gulles and puffinnes." The first really scientific observation of Cornish birds was made by Richard Carew, of Antony, who published his *Survey of Cornwall* in 1602, and whose remarks on the fauna of the county were repeated more or less exactly by all chroniclers and county historians almost to our own day. His close observation of nature and his wise incredulity give a particular value to Carew's notes of natural history. Here is an example which is of the greatest interest to an ornithologist:—

> Not long sithance, there came a flocke of Birds into *Cornwall*, about Haruest season, in bignesse not much exceeding a Sparrow, which made a foule spoyle of the Apples. Their bils were thwarted crossewise at the end, and with these they would cut an Apple in two at one snap, eating onely the kernels. It was taken at first for a boden token, and much admired; but, soone after, notice grew that *Glocester Shire* and other Apple Countries haue them an ouer-familiar harme.

The crossbill (*Loxia curvirostra*) could not be better described than in this short paragraph, and to the present day its occasional appearance produces the same terror and perplexity among the country folk. It is a common bird in no part of England; but in the West, where it appears in flocks perhaps once in each generation, its brilliant plumage, varying from rose-red to orange russet, its extraordinary beak, with its dislocated look and its odd exotic habit, are especially startling to the farmers. The crossbills arrive chattering and fluttering in an orchard, wring off the apples, hold them in one foot like a parrot, and hack them to pieces with their bills till the long hard tongue can slip into the centre and drag out the pips. The fruit is then dropped in fragments on the ground. A fir-cone gives the crossbill more to do, but seems to contain an even more delightful food, and nothing is more amusing than to see the seed extracted from between the hard shields that protect it. Carew is the only authority for the existence of the nightingale in Cornwall; his evidence, indeed, is more than dubious; he merely says, "of Nightingales few, or none at all"; but his reservation, inaccurately repeated, gave the nightingale a place among the rarer Cornish birds. As a point of fact, there seems no reason to believe that a single specimen has ever been seen or heard within the limits of the county. It is easy to an inaccurate observer, especially to an enthusiastic one desirous of being persuaded, to recognize a nightingale in the sleek person of the garden warbler, or in the rich nocturnal song of the blackcap. Mr. Rodd has some very interesting remarks on the vocal powers of the last-mentioned bird, which seems to possess a curious latent gift for mimicry, and a habit of suddenly changing the whole character of its song in a bewildering manner. Mr. Rodd, as it seems to us, scarcely does justice to the sweetness of the whitethroat's song, the prelude of which has a jubilancy at least as fine as that of his favourite the garden warbler. If the whitethroat could sustain or complete her song, she would be one of the finest English warblers, but she never executes more than a charming fragment of a theme. We observe, in passing, that Mr. Rodd gives the River Lynher as the only Cornish habitat of the water ouzel, and a Mr. James, who supplied Polwhele with a list of Cornish birds, speaks of having seen "one in the parish of Manaccan," between Falmouth and the Lizard. The present writer, who has met with it both on the upper waters of the Tamar and on one of the western tributaries of that river, is inclined to believe that the water ouzel is not so rare in the east of Cornwall as Mr. Rodd supposed.

Cornwall presents advantages to the ornithologist such as are scarcely offered by any other English county. It projects so far south and west into the Atlantic Ocean as to command a climate distinctly milder than that of the South of England generally, and a summer heat that has a certain tropical character about it. It is true that this extreme position deprives it of a few forms abundant in the north and east. Its moors, so prolific in rare species of pepit and plover, are unvisited by such familiar birds as the red grouse, while the black grouse and the quail are so rare as to be considered merely accidental visitors. On the other hand, the muddy estuaries of the Cornish coast are the natural habitat of all the race of redshanks, knots, and sandpipers, a great variety of which swell the list of county fauna with more than twenty species. The nameless stretch of salt marsh that spreads in various directions southward from the head of St. Ives Bay towards Hayle, Gwinear, and St. Erth, is singularly rich in all sorts of birds, and was still more so before it was crossed by one line of railway and skirted by a second. The high grassy tablelands, raised high above the sea by a ring of cliffs, of which the Lizard is the most striking example, harbour various species that breed in safety in the wilderness of tall

* *The Birds of Cornwall and the Scilly Islands.* By the late Edward Hearle Rodd. Edited by James Edmund Harting. With Portrait and Map. London: Trübner & Co.

herbage; while between the naked grandeur of the tors and the marshes of the sea-line there run deep valleys of woodland which conceal a rich fauna of finches and warblers, and give "space to breathe, how short so ever," to such rare and beautiful visitants as the waxwing and the golden oriole. With regard to the latter, undoubtedly the most gorgeous of all English birds, Mr. Rodd expresses an indignation which most observers of nature must have shared, that it is never permitted to breed unmolested in our woods. The golden oriole is by no means so rare a bird as is commonly supposed; it frequently appears in pairs on our southern coast in spring, and would undoubtedly build a nest and bring up its apple-coloured nestlings if its lovely yellow and black plumage did not tempt the destructive vice of every idle yokel. The habits of the bird, however, are very fantastic and abrupt; in 1870 so large a flock of orioles appeared in the woods of Trevethoe, between St. Ives and Penzance, that it was confidently hoped that they would build. Their haunts were defended and their passion for solitude respected, but after a short stay, they flew off again in a compact flock of forty, and were seen no more. It has been supposed that they appear in Devonshire and Cornwall merely as birds of passage, and that they pass eastward in the vain hope of being allowed to build their nests without disturbance in Kent or Suffolk.

There is added to this volume an appendix of more than usual interest in the form of notes on the birds of the Scilly Islands, drawn up by Mr. F. R. Rodd, of Trebartha Hall, the nephew of the deceased writer. These notes were put down from 1864 to 1871, and refer to the period when Tresco, under the protection of the late Mr. Augustus Smith, was a little marine paradise to the botanist and the ornithologist. The total number of birds now recognized as having occurred in Cornwall is 290, and of these Mr. F. R. Rodd has identified 173 as visitors or inhabitants of Scilly. When it is considered that the entire British avifauna, having stood for some time at the figure 399, has been lately raised to a round 400 by the observation of *Saxicola stapazina*, it will be seen that the little group of islets thrust out into the bosom of the Atlantic, and swept round by seas that are scarcely at rest for one week in the year, is singularly well represented in possessing forty-five per cent. of the whole catalogue of British birds. The editor closes his valuable labours with lists of Cornish and provincial names of birds, which are plainly incomplete, and for which he claims the indulgence of his readers as having missed the final supervision which Mr. Rodd intended to give them.

GRISEL ROMNEY.*

THIS is one of the many books that remind the reviewer how different his point of view is from that of the class on whose favour the success of the work depends. What he has to say about it is nothing to the sort of reader who is interested if the topics that form its subject-matter are interesting; who, if there are incidents in plenty and of sufficient variety, movements, gaieties, pretty dresses, golden hair, compliments, interspersed with the due allowance of reverses, accidents, and startling transitions, finds it an attractive story. To him, or, let us say, to her, if the heroes and heroines only talk and dance, flirt in conservatories, get up misunderstandings, quarrel, kiss and make it up, it is no matter how they do it—this is a question of accidental liking, on which one opinion is as good as another. There is the aspect, the business, the profession of a novel about the book; it *is* a novel. The world opens to eyes that read of social life under the conditions of equipages, servants, diamonds, titles, beauties, splendours; the taste catches the refinements of new phrases, the ring and the ripple, and the shimmer and the cooings of soft talk, and all that separates the fine life of books from domestic humdrum. The mind feels itself expand as, one by one, the topics of the day are touched upon. There is a sense of growing intimacy with what goes on in the world, or to put the thing in humble phrase, of getting to know what's what. Whether there is any life in the personages that act out the drama, any wit in the talk, any novelty in incident or situation, any real approach of mind to mind, any invention, any absorption on the writer's part in his creation—any reality in fact—is not a question. Young readers can often supply a good deal of this for themselves. Such readers have a real intellectual advantage over their elders; they catch fire at a touch; they have hopes and expectations that meet the writer and his tale half-way. The reader and the novelist form a partnership; the one provides the plot and the characters, the reader puts life and likelihood into them—transient life, of course, for nothing takes lasting hold that has not some vital force—but at any rate life while the reading lasts. The reviewer, on the contrary, is long past the stage of participation; as a reader of novels he sinks to the second place. He brings, instead of this frank welcome, a satiated experience; he sees nothing that is not there; his expectation of what is coming is strictly regulated and held in check by what has gone before, or what has already met his eye; no promise of exciting scenes on the writer's part allows him to count upon excitement.

These general reflections are prompted by the novel before us. The book might be a first attempt of a not unskilful pen in the field of fiction, trusting to the unfolding of the story for developing powers and quickening invention. The manner is caught, the scaffolding is up for an exciting novel of society. The characters are all entered—after Dandie Dinmont's plan of education for his terriers—and tested by the various ordeals which characterize life as it is seen in fiction. But these tests and ordeals do not produce corresponding effects. We are prepared for great consequences, but the author seems to forget her purpose. We find ourselves plunged into a railway accident at starting, of which the consequences are a broken leg to the heavy father and a sprained wrist to one of the heroines—and of course an introduction to her of Jack, the leading hero. But nothing comes of it all that a fit of the gout might not have effected more naturally; for the only use of the accident is to confine the father to one room, while the wrist that could not be touched without Lenore's turning very faint and white as she was extricated from the overturned carriage does not in the least interfere with her active share in all Christmas gaieties of the country house to which she is on her way. A very beautiful girl and a most attractive man can surely become interested in one another without this preliminary of sprains and broken bones. However, it is intended to prove Jack a man of universal resource. Nothing comes amiss to him. He knows what to do in a railway accident; he is the life of indoor festivities; he is a literary man and the editor of a leading journal, and for fifteen years he has continually moved in the best society.

A fortnight's acquaintance ushered in by a railway accident closes with a fire. Lenore as the angel and Jack as Mephistopheles form the principal figures in a group from Faust. Jack—his sable majesty—is playing chess and watching his victim with a sardonic grin; Lenore, with hair rippling down to her waist, white dress and wings, wears a look of wonderful pity, when Mephistopheles springs from his seat and tears down the flimsy background of drapery which had caught fire and already singed the angel's wings. Lenore retires to her room, her face deadly pale, but soon returns to the ball-room, and dances until an early hour of the morning. She indeed slept but little, but only because the "unwonted gaiety had chased the god away who is wooed back with such difficulty when once put to flight." We hear no more of the fire; it does even less for the story than the railway crash and all its piteous surrounding sights.

It is a virtual confession of weakness, however common a trick with novelists, to associate scenes of gaiety with appalling incidents, instead of trusting to their legitimate effect either on the conduct of the story or the spirits and interest of the reader. Such scenes in good hands have their special charm. A tender, playful insight can bring hero and heroine better acquainted with each other, set them off in some new light, engage the reader's sympathy through some fresh channel, still keeping the scene a festive scene, and the anxieties and distresses incident to all human intercourse in strict accordance with the surroundings. Of course, if it is a case of principle, if people disapprove of such scenes, it is quite admissible to make them tragic; but to use them as convenient resorts, and to ignore their true nature and purpose, is not treating readers as they have a right to expect.

Through the various influences of pleasure, together with these startling shocks, Lenore is pledged to Jack at the end of the fortnight; but it is her fate to suffer, and to be the victim of the conventional trials which befall the thoughtful heroine, where there are two of them—trials which, as the reader of any experience knows, have not reached their full sum till a lord appears on the scene. In this case, contrary to all precedent, he is an estimable lord, though very blind to what is going on. He had loved Lenore's mother, and sees in the daughter a likeness which revives the old flame. Her father, who is a baronet, supports the evil reputation of his order, and insists on the match with hints and arguments which furnish an opportunity for putting the time-honoured question—Will he sell her for a coronet? The father is not only willing, but succeeds in doing so; he hoodwinks her noble lover, and proves to his daughter that his honour and her duty compel her to the sacrifice. She renounces Jack, giving him no hint of her reasons, and marries Lord Meredith.

Jack at this stage is turned over to the heroine who gives her name to the novel. Grisel is of the childish and innocent type. She is really in love with somebody else, but does not know it, and accepts Jack at once. Here lies the proper contrast between the two heroines, both in feeling and in fate. Lenore is terribly clear in her own mind; she has owned to Jack himself that she loves one man and yet marries another. Grisel, in entire unconsciousness of her real preferences, accepts the man whom Lenore has thrown over, supposing all the while that she loves him, and only finds out her mistake after a four years' engagement, which Jack is in no hurry to bring to an end, through the enlightenment brought about by a runaway carriage accident, when she sees the right man knocked down in his attempt to stop the horses, and, believing him to be killed, faints dead away. Jack, who has been so cool a lover, has now to take a contrary line and perform a magnanimous sacrifice. Up to this time the artless Grisel had been the one to make advances, and had just urged an end to the interminable engagement. She wished to make him happier, and to this end was arming herself with keys and learning the science of housekeeping. Jack now discovers that Grisel's childlike innocence is the very thing he wants; he trusts to contact with these qualities for emancipating him from the trammels of utter unbelief in which his mind is helplessly bound. An unbelieving hero is, we know, one of the features of the model novel. The author has no sympathy with his doubts, and hopes to remove them; but this is one of the requirements of the day not to be evaded. It is the topic chosen with the old love as well as with the new. Lenore makes it

* *Grisel Romney*. By M. E. Fraser-Tytler. London: Marcus Ward & Co. 1880.

a great point that Jack shall call on her. She is interested in his second choice; they are to be friends still. Religion becomes a confidential topic, but it is one scarcely safe under the circumstances, as he connects it with his first knowledge of her. He informs her—

"You attracted me from the first moment I saw you. You awakened in me the knowledge of the want of religion in myself. It was my first cry after better things."

"And then?" exclaimed Lenore, breathlessly.

"And then," he continued, "I thought by incorporating this new life I had found with my own I should gradually grow to her standard. She would be there to point the way. And so I followed up the friendship I had begun, and then——"

"Don't," cried Lenore, "I cannot bear it."

It is certainly time for Lenore to remember her husband and pay a testimony to his merits. It is, perhaps, well that this passage occurs towards the end of the story. It is scarcely necessary to say that these deep reasons for falling in love are an afterthought, equally with the quondam lover and the author. They fit in with the subject of religion as a feminine attribute, which has to be treated towards the conclusion.

Lord Meredith is a remarkable example of what we have already noticed—the powers of endurance with which the characters are endowed. They have a way of getting over things. They have a good deal to go through, both physically and morally, but they have constitutions to bear it—nothing works the tremendous effects we might have expected from it. Lenore worries herself into typhoid fever; her husband nurses her with the tenderest devotion, which is rewarded by a distinct explanation on her part—spoken in unconscious delirium—of the compulsion by which she had been driven to marry him. Nothing is left to conjecture. She apostrophizes her father—who, by the way, had died suddenly in her presence when his work was done—"But you said I must marry him; you said I would bring dishonour on you if I did not accept Lord Meredith. Did you say I was to be sold to pay your debts; I, your only child? Father, I cannot do it. I told Jack I would marry him. I love him so. I cannot give him up." This is circumstantial certainly, and leaves no room for explaining away; but nothing particular comes of it. It is a scene of itself, with no consequences. The way in which Lord Meredith takes it ought at any rate to have made the writer hesitate before reflecting on one-half of creation in the following sentiment:—"Absolute unselfishness, a quality so rare in man." Our author very properly gives the palm to her own sex; and one means by which this impression of masculine selfishness is conveyed by her, and indeed by the ladies who write fiction as a class, is the prominent place given to the habit of smoking. Cigars play a very leading part in the novels of the gentler sex. Most men smoke, and the men who write about them take the habit for granted; but the feminine looker-on never lets it pass. It is a picturesque feature of the scene. She gives a meaning to it, and interprets it. She has a pleasant feeling of superiority as she notes it; she understands the sex and its ways.

ANDERSON ON LIGHTNING CONDUCTORS.*

IN this country we are in a rather unfortunate position with respect to the important question of the protection of buildings from damage by lightning. Accidents of this nature are not numerous enough to arouse any deep or lasting public anxiety, so that the subject receives but little attention, whilst they are quite common enough to make it desirable that protection should be more efficient than it now is. It is a significant sign of the general apathy shown in the face of this great danger that we have had to wait up to the present time for a book entirely devoted to the subject of the proper construction and maintenance of lightning-conductors, and that as yet there is no legislative enactment dealing with them—a point which we can better discuss after noticing some of the views held by the author.

Mr. Richard Anderson has made a beginning by publishing this work, which we hope will be soon followed up, and before going on to criticize details, we may fairly say that the book admirably fulfils the purpose for which it has been written. It must always be remembered in considering the subject of atmospheric electricity that here we are on very debatable ground. As we have yet no clear and simple physical theory of electricity, we are unable to discuss with any great degree of certainty problems which are far outside of the grasp of the strictly experimental method; and how can we feel much confidence in conclusions drawn from laboratory experiments, which in this case are usually made on a scale so small that they may fairly be said to be related to the vast natural phenomena much as a map of Europe of the ordinary library size is related to that continent? It is true that these experiments may give us guides to the general features of the phenomena we desire to study; but for details we must trust to experiments made on the phenomena themselves; and therefore we must be careful to give due weight to the opinions of practical men, even should they contradict our preconceived ideas. Therefore, in pointing out those views which we conceive to be erroneous in this work, we must be careful to bring direct evidence in favour of our own ideas, and not merely to cite the generally received opinions of scientific men drawn from the behaviour of electricity in laboratories. To understand properly the point we are about to discuss, however, we must start in the laboratory. Here we find that, if we take an insulated mass of conducting substance so highly charged that a spark, say two inches long, can be drawn from it, and that, instead of drawing a spark, we hold near it a pointed rod of metal connected with the earth, after a very brief time the charged conducting mass will only give a very short spark. Further than this, if the action of the point be continued for a somewhat longer time, no sparks can be drawn from the charged conducting mass. We find in the laboratory that this action of a pointed earth-connected conductor takes place at a great distance, and is the more rapid as we employ more points. Now, it being pretty well proved that thunder-clouds are highly charged masses of conducting substance, we are led to believe that a pointed rod connected with the earth will have the same effect upon them as it would have on a charged mass in the laboratory, and that the more lightning-conductors that are brought to bear on the cloud the greater this effect will be. Thus, say, a cloud is approaching a building at a height of a quarter of a mile, and is so highly charged that, when over the building, it would send a flash of lightning into it as our experimental conducting mass sent a spark to the second mass; if this building has a lightning-conductor which consists of a rod or rope of a conducting substance connected at its lower end with the earth, and ending skywards in a point, we imagine that the cloud will be so far discharged by the point that the distance through which it can send a spark or flash of lightning will be much shortened, and very probably so much so that no flash will be sent into the building. And we further imagine that the more lightning-conductors there are in a given area, the more the thunder-clouds will be discharged, and therefore the shorter will be their sparking distance. Now, let us see how far practice realizes our expectations. We quote the following from a lecture delivered at Glasgow in the present year by Professor Tait:—

I cannot pass from this subject without a remark upon the public as well as private duty of having lightning-rods in far greater abundance than we see them anywhere in this country. When of proper conducting power, properly pointed, properly connected with the ground and with every large mass of metal in a building, they afford absolute protection against ordinary lightning, every single case of apparent failure I have met with having been immediately traceable to the absence of one or other of these conditions. How great is their beneficial effect you may gather at once from what is recorded of Pietermaritzburg, viz., that till lightning-rods became common in that town it was constantly visited by thunder-storms at certain seasons. They still come as frequently as ever, but they cease to give lightning-flashes whenever they reach the town, and they begin again to do so as soon as they have passed over it.

It was this "public duty" of multiplying lightning-conductors to which we referred when we remarked on the want of legislation on the subject of protection from lightning. And if it be proved, as we believe it is, that multiplication of lightning-conductors adds to the safety not only of buildings but of human life, it may be hoped that some pressure may be put upon private persons to compel them to help, not only themselves, but the community at large. Perhaps the loss of life and destruction of property by lightning this year may draw the attention of insurance offices and their actuaries to the subject, and may lead them to make efforts in this direction. The matter really lies in their hands, and they could do all that is wanted without any legislative machinery; but were this required, the Board of Works, as far as London is concerned, through their district surveyors could easily do the work without throwing any heavy burden on the taxpayers.

But, in spite of the theoretical considerations which lead to the conclusion that lightning-conductors have this protective action, and the evidence which abounds that this action does go on in practice, Mr. Anderson completely ignores the whole of this part of his subject, and invariably treats a lightning-conductor as a means of carrying off a flash of lightning which has struck the building. The only references to the protective action in his book are in quotations from the works of others. Perhaps the reason of this neglect may be the dislike which the author evidently feels for the false and dangerous theory that there is an "area of protection round every lightning-conductor varying with its height." This theory of course arises more or less out of the proved fact that a pointed conductor is a protection against lightning. But it is quite false, and has done much to destroy public confidence in the efficacy of lightning-conductors. An ill-designed or badly-made conductor is, however, undoubtedly not only no protection, but actually a source of danger, and Mr. Anderson's descriptions of the best ways of fitting and designing lightning-conductors are excellent. He devotes much space to the description of the best modes of connecting the conductor with the earth; and he advocates the method of having two such connexions—one spread out near the surface of the soil, which will act quickly and effectively in damp weather, and another taken to natural water (as distinguished from wells and tanks having cement or stone sides), or the gas and water pipes of towns, or, failing these, so deeply buried as to be in moist earth even in seasons of drought. This method he has found good in practice, and certainly it is excellent in theory. The author also very wisely insists on the necessity for frequent inspection of conductors, by testing their electrical resistance, and especially the resistance of the earth-connexion. Curiously enough, though he gives a draw-

* *Lightning-Conductors: their History, Nature, and Mode of Application.* By Richard Anderson, F.C.S., F.G.S., Member of the Society of Telegraph Engineers. London: E. & F. N. Spon.

ing and short description of a portable testing apparatus designed for his own use, he gives no directions for taking these tests, although the method of ascertaining the condition of the earth-connexion is by no means obvious, and even a practical electrician would probably require to have it explained; and yet Mr. Anderson hopes that his book will be of use to "architects, clergymen, municipal officials, and all those in charge of large and lofty buildings." We hope he will remedy this defect in another edition, and add a few pages giving the practical method of taking all the necessary tests; and we hope also that he will draw attention to the necessity of having some means of inspecting the point at the upper end of the conductor, so that it may be kept clean and sharp, and thus in a fit state to perform its function of protecting the building against being struck.

A very large part of the book is taken up with the history of the subject, which has been compiled with great care and judgment in the selection of those passages in the history of electricity which really bear on the subject. Although written in a rather bombastic style, this part of the book is very interesting. The accounts of the opposition to lightning-conductors by the Church of Rome, and the records of the celebrated controversy in England as to the respective merits of points and balls for the terminals of conductors, show us a state of human folly in the latter end of the last century and the beginning of this which it is really hard to believe. We find some of the strongest of human passions—*odium theologicum*, party political feeling, desire for Court favour—all excited and set in full play by the apparently remote cause that an invention had appeared for protecting buildings from damage by lightning, and that men of science were not quite agreed as to the details. However, we cannot afford to despise our grandfathers, for in these days have we not anti-vaccination agitators?

We cannot take leave of this work without noticing the catalogues of works bearing on the subject to be found in it. Mr. Anderson, besides a list of nearly one hundred books which he has consulted during the preparation of his volume, also gives a list of works in general in which atmospheric electricity and lightning-conductors are more or less considered, carefully arranged in order of date from A.D. 1663 to 1879; this list includes many references to detached articles and papers. Students should be very grateful for the patient industry which has so smoothed their path, and should any later work appear of greater value, we are sure that its author will owe much of his success to Mr. Anderson's excellent carrying out of the difficult and thankless task of arranging this most valuable list.

In conclusion we may say that, in spite of the faults which we have pointed out, this book is most valuable, and should be read by all interested in the subject, and especially by all architects and builders.

FRENCH LITERATURE.

THE late M. Devaux's "Studies in Roman History" (1) are really valuable additions to the already voluminous literature of the subject. The questions of the early history of Rome can never lose their interest, because in their case there is united in a degree unparalleled elsewhere, the attraction of uncertain data, and the attraction of extreme importance in the subject. Rome and England are almost the only examples in history of nations working out their political destiny unchecked and unhurried, save in their earliest periods, by foreign influences, and this fact of itself would account for the multitude of students of their institutions. But when, as in the case of Rome, this attraction is combined with the attraction of riddle-guessing, when the facts have to be traced out in spite rather than by means of perplexing and scanty historical information, the problem becomes doubly attractive. It is a problem, however, with which it is dangerous to meddle, unless the meddler is unusually well equipped with erudition and with mother-wit, and the volumes of Roman history, or of essays on it, which are next to worthless, would make an extensive though scarcely an important or desirable library. M. Devaux's work need not be relegated to such shelves, though perhaps the value of its thousand roomy and well-filled pages is not exactly uniform. The author has picked his way through the dark places of the regal period with judgment and patience, and not unfrequently his conclusions are to be preferred to those of more generally accepted guides. In the still more embroiled difficulties of the early Republican time, he is also sober and ingenious, though, it need hardly be said that no one student of Roman history is likely to accept all his conclusions in a matter which is to a great extent one of individual interpretation. The part of his book of which he seems to have been most enamoured seems to us to be, as not unfrequently happens, the weakest. M. Devaux was of opinion that Hannibal, politically and strategically, is an altogether overrated person, and he strives to make this out by much argument to the effect that the precipitation of the second Punic war was unnecessary and unwise, the march to Italy rash and ill-considered, and the very successes of the Carthaginian hero accidental, and even insignificant. This is not the place to record or refute his arguments in detail, but we may say that he altogether fails, as it seems to us, to make out his contention. The whole of the second volume, indeed, appears to us inferior to the first, and for a simple reason. From the time of the invasion of Pyrrhus, the facts, if not exactly known with an intimate and indisputable knowledge, are sufficiently ascertained in general. Unless, therefore, a writer has some special narrative gift, he does not do much for us by going over them again. In the earlier period every worker may do good work.

The fifth and for the present, it seems, the last volume of M. Champfleury's interesting history of caricature (2), deals with the periods of the Reformation and of the League, with a kind of postscript embracing the subsequent period up to the Revolution. The League, as is well known, was very rich in caricatures, and in other respects the period is one offering plenty of material to the historian. Especially interesting are the passages which M. Champfleury devotes to Lionardo and his curious fancy for drawing types of ideal ugliness, and to Callot. He evidently expects that his verdict on the famous Lorrainer will not meet with general approval, but for our part we feel inclined rather to agree with him. The evidence he produces of anticipation by others of the points often supposed to be most characteristic of Callot is certainly strong. Still, individual opinion must always be allowed considerable latitude in such matters, and individual opinion, if we may judge by the prices Callot's work fetches, is for the most part against M. Champfleury. The volume, as usual, is full of illustrations, and the majority of these offer tempting subject for comment. But we must refer readers to the book itself. Although the series can perhaps hardly pretend to be a complete history of grotesque and satiric art, the interest of its text, the abundance of its illustrations, and its extreme cheapness, make it a possession equally desirable and easy to secure.

M. Albert Babeau, who has already written a useful description of the institutions affecting village communities under the *ancien régime*, has now returned to the charge with a book (3) on the urban institutions of the same period. Any such treatise of a moderate size is necessarily a *résumé* of the facts rather than a detailed account of them. There was an immense amount of individuality in the institutions of ancient France, and probably a volume as large as this could be written with profit on every one of the principal towns. But it is clear that the points of agreement may also be profitably summed up in a single treatise, and this is what M. Babeau has done.

We have received a considerable number of works relating to Belgium, most of which are interesting in connexion with the recent Jubilee. Baron van der Smissen (4) deals briefly with the question of national defence and with its bearing on his own country, urging that Belgium, while putting her trust in England, should also not neglect to keep her powder dry. Baron Goethals (5) handles the same subject, entering more into detail, and recommending very many alterations in the Belgian army. M. Juste (6) has compiled an elaborate history, in two large volumes, of the negotiations which led to the establishment of Belgium as a constitutional kingdom; and the memoirs of Count van der Meere contribute additional information on the same subject. This latter book (7) is rather tantalizing to Englishmen, because Count van der Meere took part in the Waterloo campaign, and might have thrown some new light on that much-debated subject; but beyond expressing a profound conviction that Wellington ought to have been beaten, he does not say much about it in these pages.

Le sieur de Va-partout (8) is a somewhat flimsy book, but not unamusing. The English title would be "Passages from the Life of a Reporter," and it may be presumed to be a collection of *feuilletons*, though we have no positive information of this. A visit to Lourdes, and a description of M. Grévy's retreat in the Jura, a day at Chantilly, and a dinner at the "Caveau," are examples taken at hazard from its chapters, and may give a tolerable idea of the sort of matter it contains.

The books of travel of the month do not include anything very remarkable. "The Conquest of Tonquin by Twenty-seven Frenchmen" (9) is a sufficiently ingenious title to cover a popular account of M. Dupuis's well known explorations in the Indo-Chinese peninsula. Of course the title is a misnomer, and the narrator, or rather the compiler, probably forgets that it does his hero no very great service to represent his proceedings by a phrase which the enemy might very well take as a confession of filibustering. That M. Dupuis's journeys were courageous and not uninstructive nobody denies. M. Révoil's book (10) contains the account of a less pretentiously denominated conquest—that is to say, the opening, or the attempt to open, to trade of the regions immediately adjoining Cape Guardafui. M. Révoil has, it seems, made two journeys to the spot with this intent; one in a privately chartered vessel

which simply coasted the district, the other inland and with not uninteresting results. It is a question whether the wealth of the Somali country is not somewhat exaggerated here; but no one can question the importance of taking some steps to prevent the half-licensed wrecking which at present takes place whenever, as too often happens, a vessel goes ashore at this dangerous shoulder of Africa. M. de Rivoyre's district (11) almost adjoins that of M. Révoil. M. de Rivoyre is a good specimen of the Frenchman who believes in the innate and ineradicable perfidy and wickedness of Albion, and he seems to have published his Abyssinian travels—which took place, as far as we can make out, some years ago—partly to defend the memory of Theodore, partly to urge the development of the French settlement of Obock, which lies just outside the straits of Bab el Mandeb. Aden and Perim seem to stick in his gorge terribly, and his only consolation is the thought of setting up a rival to them.

It is not to be wondered at that a second edition of the letters of Delacroix (12) should have been called for. The Victor Hugo of painting was not, at least in his later years, a man of many friends, but throughout his life he appears to have been sincerely attached to those whom he did admit to his friendship. Not a few of the earlier letters date from the time of his visit to England, five-and-fifty years ago, in the thick of the short-lived fancy for huge canvasses, the fancy by which Hilton profited and Haydon did not profit. The book (as volumes of letters, if honestly written and not designed for publication, always do) shows its author's nature better than the most elaborate biography. We shall not say that it makes us wonder at the charge of want of amiability which has sometimes been brought against Delacroix, but it shows clearly enough that that charge had very little real foundation, though it may have had some plausible excuse.

M. de Laveleye has done well in reprinting (13) some articles on the subject of the Italy of to-day which he has recently contributed to the *Revue de Belgique*. Ardently as many Englishmen have given themselves to the study of things Italian, the contemporary politics of the Peninsula have not received for the most part any great share of their attention. That M. de Laveleye is a qualified, able, and fairly impartial observer, is indisputable, though he is perhaps a little too prone to look at all creation through spectacles, of which the one glass is Constitutional Government and the other Free-trade. These particular spectacles are, however, not the most unsuitable for the contemplation of contemporary Italy, and they do not induce their wearer to distort facts. The book is especially valuable for the gallery of lively portraits of men distinguished in social and political matters which it contains.

Perhaps less interest is felt nowadays in the *mal du siècle* (which, if not extinct, has undergone very decided transformations) than was the case a few years ago. M. Charpentier's book (14) is, however, by no means an unimportant contribution to the history of the late eighteenth and early nineteenth century. It takes the form chiefly of a panorama of the chief prophets of *Weltschmerz*, from Rousseau to the Guérins. Many of these, such as Jean-Jacques himself, Sénancour, Chateaubriand, &c., are, of course, subjects on which it is very hard to say anything new. But others, such as Ramond, the eldest child of Werther, as the group of minor stars—very minor stars, most of them—who revolved round Chateaubriand, and as that strangely undeveloped genius, Ulric Guttinguer, will be novel to most people, and interesting even to those to whom they are not novel.

Deux républiques (15) is an elaborate comparison of the French Republic as it is, and as M. Portalis thinks it ought to be, that is to say, approximated to the institutions of America rather than of England. The most piquant thing about the book is the preface, where the author sets forth the many things he has suffered at the hands of the Republic, and rather maliciously contrasts the M. Gambetta of twelve years ago with the M. Gambetta of to-day.

M. Gustave Masson has been well advised in drawing up a short volume (16) of selections from old French history to serve at once as a reading book and an historical manual. We only doubt the wisdom of inserting pieces which are in no sense historical, and which might have been well reserved for a companion volume. But it is to be hoped that the little book may be widely used, for its intrinsic interest is great and the delusion (almost as prevalent in France as in England) that old French is an unreadable jargon cannot be too soon removed. The selections are made very judiciously and for the most part from the best texts. M. Masson, however, does not seem to be aware that Pluquet's very faulty text of the *Roman de Rou* has been recently superseded by an excellent edition published by Dr. Andresen. Otherwise he would doubtless have given the latter's text and would not have repeated the unauthorised description of the author as *Robert* Wace. There is, we believe, no authentic evidence as to the good Jerseyman's Christian name.

A sentence in the preface of M. Chassin's book (17) indicates excellently its weak point. It is there described as "très propre à entretenir l'horreur de l'ancien régime féodal et clérical, ainsi que l'amour de démocratie républicaine." This is not the spirit in which any good historical work ever was or ever will be written, no matter what side the writer may choose to champion. *L'Église et les derniers serfs* is diffuse and exaggerated in tone, and digresses into subjects (especially that of the *droit du seigneur*), which are foreign to its immediate subject. The historical student may find some useful information in it, but will have to extract this information from much that is useless, if not misleading.

The third edition (18) of M. Naville's temperate and sometimes eloquent discourses on theism and atheism contains an appendix, bringing up the sketch of atheistic developments to the present day, or at least furnishing some materials for such a completion.

We may also note a new and cheaper edition of M. Vitet's excellent essay on the history of the Académie de Peinture et de Sculpture (19).

M. Maurice du Seigneur (a name which calls up pleasant recollections of the palmy days of the romantic movement, for Jehan du Seigneur—the *h* being obligatory—was the sculptor of the lesser Cénacle) has, like many other, if not most other, Frenchmen of letters, attempted the salon (20). The preface contains some remarks which are worth attention, especially on Courbet and Manet. The actual notice is neither better nor worse than most of its numerous kind.

The fifth year—1879—of the theatrical annual (21) of MM. Noël and Stoullig has appeared. It is a stout volume of nearly six hundred pages, and seems to do the work of such a register with some thoroughness.

The catalogue of a trade association which has given an exhibition of its wares is not very often a work of much literary interest. But an exception must be made in favour of the volume (22) in which the Paris book trades have re-recorded their first display of this kind. Certain printers, paper-makers, and manufacturers of printing ink have combined to do their best with the book; and it thus presents a very curious exhibition in itself of different coloured inks, varied *encadrements*, and other ornaments of the mechanical part of book-producing. We must confess that to some extent this display confirms us in the opinion that, save in the judicious admixture of black and red, diversity of colours is no great advantage in the matter of typography. But the volume is decidedly curious, and often not wanting in beauty.

A considerable number of works published in parts or series call for notice in passing. The fifth volume of the *Grands écrivains* edition of Molière (23), desirable as are almost all these editions, has appeared, and contains *Le festin de Pierre*, *L'amour médecin*, and *Le misanthrope*. The July number of the *Revue des questions historiques* (24) contains several articles of interest, notably one on an episode of the relations of France and Italy at the close of the fourteenth century. In the second number of the new *Revue des arts décoratifs* (25) some good designs of ironwork by M. Viollet le Duc are illustrated. M. Godefroy's great work of old French lexicography (26) has reached its third *fascicule*. We have also received the Seventh Part of the extensive Dictionary of Antiquities (27) now being published by Messrs. Hachette, the Fourteenth Part of their new Geographical Dictionary (28), and the half-yearly volume of the *Journal de la jeunesse* (29), which is remarkably rich in good illustrations. Among works requiring rather allusion than comment may also be mentioned the Report of the administration of Egyptian State domains (30), and a treatise on the use of anæsthetics in surgery (31).

Mr. Cust's short treatise on Indian religions and languages (32) deals with a complicated and difficult subject clearly and with a judicious observance of the point.

If age, volume of production, and average merit be taken into

I not be rash to say that no French poet is less known in England, with less reason for ignorance than M. Victor de Laprade. M. de Laprade is a deliberate, though by no means a slavish, follower of Lamartine; and the doubt of the master's importance which, as Mr. Matthew Arnold tells us, he ventured once to hint to Sainte-Beuve, may possibly be felt still more strongly by English readers of the disciple. Certainly, the author of these poems (33) has very little in common with most of the bards who are now his contemporaries. Neither his style nor his matter is striking at once—he does not compass sea and land to catch one adjective and employ it with a *flamboyant* effect when he has caught it. In subject he is equally far from realism—which is a point in his favour—and from the devotion to art for its own sake and before everything else. But though he is a little old-fashioned, and sings in subdued keys, there is often melody in his singing, and not seldom dignity and poetical quality in the song. The longer pieces of the volume are the most Lamartinian; the shorter, or at least some of them, escape from the commonplace of chastened sentiment, and strike an original note. The defiance of "Les Dieux qu'on brise" has the right ring about it, and "Le faune," as a piece of picture-poetry, would not be easy to surpass.

M. Léon Cladel has long been in possession of a kind of esoteric reputation in France not dissimilar to that possessed by some writers who it would be invidious to name in England. His admirers proclaim him to be something quite out of the common way, and this in one sense or another everybody must grant. His style is exceedingly odd, not to say *baroque*, and he has a tendency to employ sentences of Rabolaisian length as well as of Rabelaisian oddity of phrase. *Crête-rouge* (34) is not the best thing he has done, but it will give readers some idea of him. The scene is laid at Paris during the siege. In *Inés Parker* (35) M. Mario Uchard, author of the well-known play *La Fiammina*, has written a better book than most of the novels that come before us, though there are some faults in it and some absurdities. The beautiful American heroine is now a stock character with French novelists. But Inés Parker has sufficient originality to separate her from the majority of her sisters. As a study of character the book cannot be very highly commended, but it has interest as a story. Much higher praise must be given to *Le Forestier* (36), which is a study of sylvan life in the great forests of the west of France and shows an extraordinary power of handling such matter. On the other hand, *Mademoiselle Clarens* (37) is a novel of an ordinary type, and not good of its kind. M. Fortuné du Boisgobey, who seems to be writing with surprising rapidity, has turned out in *La main coupée* (38) a very long romance of crime after the fashion rather of Gaboriau than of anybody else, though with less elaboration of plot. His two closely printed volumes contrast in point of bulk remarkably with the single volume of widespread typography which, as a rule, and perhaps wisely, contents the Parisian novelist nowadays. But, with the possible exception of *Crête rouge*, which is a curiosity of literature, and of *Le Forestier*, which is rather a picture of wild life than a novel, none of these books can compare with M. Ludovic Halévy's lively sketches, which may be depended upon to make all but the dullest or the most squeamish readers laugh till they cry (39). They are farcical certainly, and French farce is and always has been of the broadest; but their farce almost deserves the title of comedy. *Régénérés* is one of the most delightful pieces of satirical wit that we have seen for a long time, and the sketches which come more directly under the title of the book do not fall far short of it. M. Halévy has in some wise picked up the mantle of M. Droz, or a portion of it; but he has eked it out with plenty of his own cloth. And it may fairly be allowed him that, if much of the morality he depicts is vile and despicable, he does not omit to show pretty plainly that he is well aware of the fact, and not disposed to make light of it.

THE EASTERN QUESTION.

THE anticipation that the six Powers would cease to act in concert on the Eastern question has thus far not been justified by experience. Political critics who foresaw the difficulties which might impede common action overlooked the pledge which all the Governments virtually exchanged with one another when they undertook a joint enterprise. That their objects were in some respects different, and that they were actuated by various degrees of zeal, were considerations which must have occurred to all of them before and after the Conference at Berlin. The paramount importance of ending a dangerous controversy was nevertheless acknowledged by all the Powers; and when once they had engaged in the common undertaking, they had a further interest in not exposing themselves to ridicule. It appears from Lord GRANVILLE'S statement on Monday that the harmony which had been established is hitherto unbroken. The first demand which was made on the Porte has been conceded, partly because it was expressed in peremptory language, and perhaps in some degree with the hope of facilitating resistance to a larger claim. The Collective Note presented by the Ambassadors required the transfer of Dulcigno or, as an alternative, of Tusi, to Montenegro within three weeks from the delivery of the document. The SULTAN and his Ministers have now promised compliance; and orders seem to have been issued to the officers in command of the Turkish troops to compel the Albanians to acquiesce in the surrender of one or the other district. Lord GRANVILLE properly declined to explain the methods which will be employed by the allied Powers, if the measure is either purposely or involuntarily evaded. It will probably not be necessary for the present to despatch a combined fleet to the Turkish coast; and it is desirable that the transaction should, if possible, be completed without a display of force. The Government expresses the universal feeling of the country in refusing to connect the Afghan complications directly or indirectly with the policy to be pursued in Eastern Europe. If England is no longer to meddle with great European questions, because a thousand men have been sacrificed by unskilful generalship in Asia, it is time to withdraw not only immediately, but permanently, from participation in the European concert. When the Albanians find that the Turkish Government is in earnest, they will probably recognize their inability to resist the demands of the Powers.

On other subjects of negotiation the same admirable unanimity subsists. Mr. GOSCHEN reports from Constantinople that the Ambassadors are agreed as to the reforms to be introduced into Armenia; and Lord EDMOND FITZMAURICE finds his colleagues on the Commission for reorganizing the administration of the European provinces equally ready to concur in the measures to be adopted. It is true that both in Europe and Asia there is a wide chasm between the conception of a rational mode of government and the execution of any scheme which can be devised; but it is something to obtain the assent of all the Powers to proposals which may be urged on the Porte with their united authority. The practical acceptance by the Porte of the simplest of all the recommendations which have been made will perhaps form a precedent for habitual deference to sound advice. It would be inexpedient to enforce salutary counsels by definite threats; but Lord GRANVILLE warns the SULTAN and his advisers that contumacy will tend to the early dissolution of the Empire. He is fully entitled to quote in support of his own opinion the deliberate judgment of all statesmen, not excepting Lord SALISBURY. For himself the FOREIGN SECRETARY repudiates the charge of ill-will to Turkey which might be justly urged against his most eminent colleague. In truth, the character of the Eastern question has been fundamentally changed by the results of the last Russian war. The fabric of Turkish rule was maintained with the approval of successive English Governments, because the dangers which might result from its overthrow appeared to preponderate over the evils which it involved. It has now become impossible to sustain the independence of the SULTAN, and the least mischievous alternative is to induce or compel him to correct intolerable misgovernment. When the proposals of the Commission are carried into effect in Macedonia, and when the scheme elaborated by the Ambassadors is applied to Asia Minor and Armenia, the Turkish Government will perhaps be relieved from the fear of foreign aggression. The correspondence between Prince LOBANOFF and Lord GRANVILLE confirms the belief that the Russian Government is aiding the preparations of the Bulgarians for a rupture with Turkey; but the Imperial policy is perhaps only tentative and provisional, and at any moment Prince ALEXANDER may be ordered to suspend or discontinue his armaments. Lord GRANVILLE may perhaps have succeeded in dispelling the just suspicion with which Mr. GLADSTONE'S policy may have been regarded by Austria. The Balkan Principalities are not, in time of war, a match for Turkey; and they will not be allowed to disturb the peace of Europe, as long as the Great Powers are in concert.

When the matter of the Montenegro frontier is settled, the Powers will have to occupy themselves with the question of Greece. There is reason to believe that, for the present, the Turkish Government has no intention of surrendering Janina, Prevesa, and Metzovo. HOBART PASHA is perhaps too positive in his statement that a frontier excluding from Greek territory all these places was suggested by the Congress of Berlin. The line of division, which was drawn by M. WADDINGTON and accepted by his colleagues, was studiously vague; and consequently a controversy as to its meaning has been proceeding ever since. According to Admiral HOBART, the Conference has added a strip of land forty miles wide to the territory assigned to Greece by the Congress. He adds the statement that the new delimitation will transfer to Greece a considerable Mahometan population; but the Commissioners who advised the Conference had satisfied themselves that the bulk of the population was Greek in language and religion; and the doubts which Admiral HOBART throws on their genuine Greek pedigree ought not to affect the arrangement. As in the case of German nationality, according to the definition of the popular song, the country where men talk Greek and recognize the Greek Patriarch is essentially Greece. Janina, though a large part of the population is of Albanian origin, belongs to the Greeks in right of a common civilization. The allied Governments have offered to guarantee the property of Mahometans in the districts which are to be ceded. It is alleged that the Mahometans who reside within the present limits of the kingdom are not discontented with the treatment which they receive, but no implicit confidence can be placed in an Administra-

tion which is only better than that of Turkey, though it is much more capable of improvement. The Ionian Islands, which formed the latest addition to the territory of Greece, have, as might be expected, since receded in civilization and prosperity, but Thessaly and Epirus will be more contented and better governed when they cease to be Turkish provinces. It may, perhaps, also be more practicable to introduce a better system of administration when the wealth and population of the kingdom are increased. According to modern notions, a State which includes the territories of Athens, Thebes, Corinth, Argos, and Lacedæmon, is too small for good government.

The report that the Greek Government is arming, and that its warlike preparations are no longer discouraged by the European Governments, appears to be well founded. The English Government had at one time advised the Ministry of Athens to suspend its armaments; but, as Sir CHARLES DILKE stated in answer to a question, the other Powers gave no similar advice, and England thought it unadvisable to interfere alone. An army of twenty thousand men, to be shortly increased to thirty thousand, is on foot; and yet it can scarcely be intended to engage in a single-handed struggle with Turkey. While there is little goodwill between the Greeks and the Sclavonic population of the Balkan peninsula, a Greek invasion of Epirus might perhaps lead to a declaration of war against Turkey on the part of Bulgaria and perhaps of Servia. With any one of its probable adversaries, and perhaps with all, Turkey might hope to contend with success, if it were certain that Russia would be held in check by Germany and Austria. Neither England nor France would assist the Greeks with reinforcements by land, though England might perhaps exhibit sympathy by sending a fleet to cruise in the Adriatic or the Ægean. The sudden coldness of France in the Greek cause has not been satisfactorily explained. The postscript in favour of Greece which was informally added to the Treaty of Berlin was proposed by M. WADDINGTON, and its insertion was attributed to the wish of the other Powers to conciliate the French Government. M. DE FREYCINET's Cabinet sent a Plenipotentiary to Berlin in the present year, and it was therefore a party to the unanimous decision of the Conference. The Government also despatched an officer, General THOMASSIN, to advise the Greeks on their military preparations; and his mission was considered the more significant because it was understood to have been suggested by M. GAMBETTA. It is now understood that, except by advice to both parties, France will not promote the Greek demands; and General THOMASSIN has been unexpectedly recalled. Of the other Powers, England is thought to be most in earnest; and Russia, which had hitherto always discouraged Greek pretensions, is now forward in insisting on submission to the European decree. If the Greeks attempt to occupy any part of the disputed territory they will almost certainly be defeated. The Albanians alone are probably strong enough to defend their country against an invader of limited resources; and the regular Turkish troops are superior in discipline to the newly levied Greek regiments. The cession must be effected, if at all, by pressure applied to the Government at Constantinople. It may indeed be plausibly argued that the Greeks have, according to the general rules of international law, no right to an extension of territory merely on the ground that they abstained three years ago from an unprovoked attack on a nominally friendly neighbour; but in the special case the law has been made or authoritatively declared by a tribunal which has the right of judicial legislation because it has the power to execute its judgments. Even if the cession of territory is deferred, the disputed districts will never again be held by Turkey under a safe title. On the other hand, the surrender would scarcely weaken the SULTAN; and in possible contingencies it might provide him with a useful ally.

THE HARES AND RABBITS BILL.

IT appears to be regarded in certain quarters as a kind of *lèse majesté* to criticize any of the actions of the present Government. We do not know whether it is equally treasonable to point out that their measures receive a very singular amount of criticism from their own supporters. The Hares and Rabbits Bill has passed its second reading, has got into Committee, and has made some small progress in those not always tranquil waters. But already Sir WILLIAM HARCOURT is complaining of the "misunder-"standing and misrepresentation" which his amendments have met with at the hands of the chief Liberal organ in the daily press. It must be confessed that these amendments are in themselves sufficiently curious, and that they follow with a most remarkable faithfulness the course of conduct pursued by the Government in the case of their other great measure, the Compensation for Disturbance Bill. To run with the hounds and hunt with the hare is a proceeding irresistibly suggested, not merely by the title of the Bill, but by the conduct of its defenders. We have before now pointed out that, in the very nature of it, it is a Bill little likely to satisfy any party, while calculated to win a certain amount of half-hearted support from all. The half-hearted support was manifested on the second reading; the dissatisfaction has already received pretty ample illustration in the proceedings of Tuesday and Wednesday; nor can it be denied that the HOME SECRETARY's amendments were of a character likely to make this discontent on the Radical side at least show itself very decidedly. The gusto with which the Bill was at first received by that party depended entirely on the supposed creation by it of a right for the sporting farmer and the sporting labourer to share the privileges of their superiors, and the HOME SECRETARY's amendments went for the most part to the curtailment of this innovation. According to the original proposal it would have been perfectly competent for a tenant-farmer, who did not care for sport and was anxious to spite his landlord, to turn half a village into licensed poachers, and what is more, licensed night poachers. The amendments guard this extraordinary right in a manner likely to interfere with the sporting labourer in no small degree, while other limitations of time and circumstance which they impose interfere materially with the Radical dogma that any man, except an owner of land, ought to be authorized to kill all animals *feræ naturæ* at such times as seem to him good and fitting.

The actual proceedings of Tuesday and Wednesday were very characteristic of the present Parliament and of its present leaders. It might have been thought that the limits of possible eccentricity had been reached in the coachmanship of the Disturbance Bill, but Sir WILLIAM HARCOURT is of a nature not to be left behind by any one. In the first place the tenor of the desultory debate which occupied two afternoons and an evening, displayed a curious double nature in the Bill. It is exceedingly difficult to make out whether it is a Bill for the removal of something that is a nuisance to the farmer's crops, or a bid for the farmer's political support by providing him free of charge with sporting rights. Mr. BRIGHT, who is a sportsman in his way, seemed to point to the latter conclusion in both the extraordinary onslaughts in which he endeavoured to top the part of first swordsman to the HOME SECRETARY's Bessus. Again, when the question of limiting the use of the gun by the farmer and his myrmidons was mooted, the supporters of the Government exclaimed against the "shabbiness" of such a limitation. We must own that if the Bill is what it pretends to be, a Bill for the thinning of destructive animals, we cannot see the shabbiness of prescribing those means of destruction which are undoubtedly most effective. On the other hypothesis, of course, the argument is clear enough. The same confusion of thought was shown capitally by Mr. WIGGIN, who, supporting the measure with enthusiasm, proceeded to speak of hares and rabbits as "those useful animals," which seems to be a somewhat rapid and singular change of the point of view. Mr. LABOUCHERE's amendment extending the Bill to winged game may be taken as another instance of the hopeless confusion which seems to prevail in the minds of the Government and their supporters on the question. The truth simply is that in voting for Sir WILLIAM HARCOURT's measure every individual member is voting for a separate ideal measure of his own. To one it is an instalment of the ardently desired abolition of the Game Laws; to another, a useful and cheap lure to make the farmers vote for the Government; to another, a slap in the face to a hated class; to a fourth, a measure likely to increase the profit of a class to which he belongs or which he favours; to a fifth, a concession to a favourite hobby about agriculture and the tenure of land. "Light "and leading" might perhaps succeed in fusing these heterogeneous elements into something like a whole. But though there is plenty of heat on the Treasury Bench just

now, there does not appear to be by any means a superabundance of light. The intelligent and statesmanlike manner in which Sir WILLIAM HARCOURT handles the measure could hardly have been better illustrated than by his astounding declaration on Wednesday that he was quite ready to withdraw the amendments which he had deliberately and with no little circumstance proposed, in defence of which he had quarrelled with the Liberal organs, and which might, if only by courtesy, have been supposed to represent the matured judgment of the Government, guided by the results of the debate on the second reading. So much for light. As for leading, the simple plan of generalship observed in reference to the measure is that the HOME SECRETARY should make occasional razzias upon all and sundry who oppose it, and that Mr. BRIGHT should sally out behind him to cut the throats of the fallen. It is scarcely surprising that these tactics should have aroused a bitter feeling of opposition, and should, especially in conjunction with certain other matters occurring simultaneously, have brought about one of the most ill-tempered discussions which has for some years been heard in the House of Commons.

We must indeed own that the merits or demerits of the Hares and Rabbits Bill seem to us to be a matter of much less moment than the manner in which that Bill has been managed, and the other circumstances to which we have just referred. The debate has been again and again interrupted or postponed by vain attempts to extract from Lord HARTINGTON some definite information as to the probable progress of business, attempts which, in consequence of the conduct of the Government, have resulted only in an increase of acerbity in the discussion of a measure in itself only too likely to occasion angry feelings. It would really seem as if the Government had come to the conclusion that the only chance of carrying through the preposterous programme of business announced on Monday night was to keep the House in as great darkness as possible about the order of business, so as to be able to steal a march upon their opponents now and then. That such was Lord HARTINGTON's deliberate purpose no one can for a moment believe. But unluckily there are some courses of conduct which expose those who pursue them to unpleasant suspicions, however guiltless they may be. We believe it is not incorrect to say that the extremest uncertainty has prevailed throughout the week as to the exact business which might be taken on any particular night. Now, considering that the time for prorogation under ordinary circumstances had already arrived, that the House had given up to the Government the whole of its time with the exception of Friday night, and that notwithstanding this sacrifice and the adoption of morning sittings—things usually reserved strictly for that period of the Session when land is seen—no intimation of a date for breaking up had been given—the very least that Ministers could do was to be extremely explicit as to the actual work likely to be taken on given days. This is exactly what they refused to be, and this refusal it was which occasioned the angry recriminations of Tuesday and Wednesday. These recriminations, in so far as they concern the Opposition, have been misrepresented as obstruction, and as being unworthy devices to stall off the passing of the Hares and Rabbits Bill. It is sufficient to look at the names of the persons who have been chiefly concerned to judge the truth of this assertion. Lord EUSTACE CECIL is not generally supposed to be a member of what a threadbare joke calls the fourth party, and Sir STAFFORD NORTHCOTE has not usually been considered an aider and abettor of wanton and gratuitous obstruction. The simple facts are that the conduct of the HOME SECRETARY and the CHANCELLOR of the DUCHY has irritated their opponents, and that by some ill-luck Lord HARTINGTON, perhaps because the leadership of the House has not previously been in his hands, has failed to make up for his colleague's shortcomings by attention to the legitimate demands of the Opposition. The absence of Mr. GLADSTONE must be admitted to be a serious drawback. It is perhaps a natural delicacy which restrains Lord HARTINGTON from checking friends over whom he has no technical superiority of position, when they resort to such weapons as those which during three sittings of this week Sir WILLIAM HARCOURT and Mr. BRIGHT freely employed. Mr. GLADSTONE, to do him justice, would neither have employed those weapons himself nor, though he might have nominally supported his subordinates, would he have failed to make some kind of apology for them. He is overbearing and passionate enough; nor is he always sufficiently mindful of the decencies. But he is never insolent; and though insolence is a very ugly word to have to apply to Ministers of the Crown, we can hardly find a milder one to suit Sir WILLIAM HARCOURT's treatment of Mr. HICKS on Tuesday, and of Lord EUSTACE CECIL on Wednesday, or Mr. BRIGHT's gratuitous rating of the whole Opposition on both days. The policy of hectoring and scolding members of Parliament is one which is certain to fail, but it is one which we are extremely sorry to see tried. For many reasons, it is to be desired that the Session should not be prolonged indefinitely, but perhaps for none more strongly than because of the extraordinary effect which the prolongation seems to exercise on the temper and manners of HER MAJESTY's Ministers.

AFGHANISTAN.

IT is possible that political or military reasons may sufficiently account for the sudden retreat of the army from Afghanistan; but, in the meantime, the general surprise and disapproval which the policy of the Government has caused in India will be largely shared in England. The orders which are now in process of execution had doubtless been issued from Simla before the disaster on the Helmund; and it may be assumed that afterwards Lord RIPON again referred the question to the Government at Home before he confirmed the former decision. Both the VICEROY and the Cabinet must have been well aware that Afghans and Indian subjects of the Crown will ascribe the retreat to the defeat of General BURROWS, of which it was assuredly not desirable to exaggerate the importance. It is true that the Government had announced the intention of evacuating Cabul as soon as the authority of the new Ameer had been established; but there is as yet no proof that he is strong enough to maintain himself in Northern Afghanistan. The voluntary retreat of the main army becomes a subject for still more serious consideration when it is regarded in connexion with the bold enterprise undertaken by Sir F. ROBERTS. It might have been thought that it was indispensable to secure a base of operations for the force which is charged with the relief of Candahar. Sir F. ROBERTS and Sir DONALD STEWART have now broken off all connexion with one another in their diverging movements; and until General ROBERTS reaches Candahar early in September he will have no line of supply or of retreat. Unless the evacuation of Eastern Afghanistan is very partially carried out, the extreme heat of the weather will necessarily cause distress and loss to the troops. The Government had evidently resolved to withdraw the army before the passes were closed by frost; but the march would have been less oppressive two months hence than in the height of the summer.

Although the result of the war will at the best be thoroughly unsatisfactory, the blame of an abortive enterprise will not fall exclusively on the authors of the war. Lord BEACONSFIELD, Lord SALISBURY, and Lord LYTTON would certainly not have provoked the contest, unless they had hoped that it would be prosecuted with spirit and perseverance to the end. It may be doubted whether any attainable object would have compensated for the risks and losses which have been already incurred; but, if the army in retiring had left behind a friendly or dependent State, it might have been plausibly contended that the relief from external danger to India had not been too dearly purchased. The warmest partisan of the late Government would have disapproved of the war, if he had foreseen that the capital and the country would be precipitately abandoned. Lord HARTINGTON was thought to have been unduly communicative when he announced soon after his accession to office that the troops would be withdrawn from Afghanistan at the earliest safe opportunity. Neither his supporters nor his opponents then believed that the retreat would begin as soon as a vague verbal agreement had been made with a candidate for the throne who is not bound by ties of gratitude or interest to the English Government. No form of weakness is more to be distrusted than the not unusual combination of rashness with timidity. The recall of General STEWART and his army seems to have been dictated at the same time by unnecessary alarm, and by disregard of obvious danger. It will be for the Government hereafter to show that the balance of risk was on the side of

the policy of standing firm at Cabul, at least till Candahar was relieved. Lord HARTINGTON'S answer to Sir W. PALLISER indicates an imperfect appreciation of the serious danger which may attend a too hasty escape from a difficult position. Any untoward consequence of Sir F. ROBERTS'S hazardous expedition would not be readily forgiven. There is no reason to apprehend that Sir DONALD STEWART will meet with any serious difficulty in his short retreat to Gundamuk. The army at Candahar will communicate with India only by way of Quetta and the Bolan Pass; and Sir F. ROBERTS, until he can effect a junction with General PHAYRE, will be left in the air. There would be little cause for surprise if the whole of Afghanistan were soon in arms against an enemy who has ostentatiously displayed the consciousness of weakness. It will be well if the heavy responsibility which the Government has assumed is justified by eventual success. That all the possible fruits of a costly war have been deliberately sacrificed will be attributed by one party to the originally false policy of the late Government, and by the other to the hasty redemption by Lord HARTINGTON and Mr. GLADSTONE of pledges given in opposition. It is not impossible that both Governments may have been to blame.

The scanty and tardy reports which have been received from Candahar may by sanguine minds be regarded as partially reassuring. The slow advance of the Herat army indicates either that its losses on the Helmund had been severe, or that its movements were embarrassed by the divided counsels of the military chiefs. More definite satisfaction may be found in the indirect contradiction of the report that General PRIMROSE, by taking refuge in the citadel, had abandoned the attempt to hold the city against the enemy. It now appears that the Afghan soldiery has been expelled from the city, an operation which would have been impossible if the garrison had been shut up in the citadel. The remaining population probably consists of peaceable traders who have a common interest with the English garrison, inasmuch as they are exposed to plunder and massacre. The fighting men, who have been driven out, will of course join the enemy, but they would have been more dangerous within the walls than in the field outside. The deficiency of the water supply in the citadel will not be equally felt in the city, which is traversed by canals. The richness of the surrounding district may probably relieve the Afghan army from the difficulties which ordinarily attend the want of a commissariat. The garrison has a supply of provisions for more than a month; but the stores will scarcely suffice for the inhabitants of the city. Additional supplies may probably have been brought in from the neighbouring villages during the interval between the battle on the Helmund and the approach of the hostile army. It may be worth Lord HARTINGTON'S while to ascertain whether General PRIMROSE will, on the junction of the armies, take the chief command. After more than seventy years of service it is not forgotten that two incapable generals in succession superseded Sir ARTHUR WELLESLEY on the field of Vimiera. Similar indifference on the part of the present Government might end in something worse than the Convention of Cintra. It may be hoped that before the final retreat the honour of the English arms may be restored by the defeat of AYOUB KHAN; but, for the present, assurance of the safety of the troops would in itself afford great relief. At any rate we may trust that Quetta is to be permanently held. The loyal aid which has been given by the KHAN of Khelat must not be repaid by desertion, which would expose him to the resentment of his powerful neighbour.

The many-sided controversies which have been raised by the Afghan difficulties will soon have ceased to possess practical interest. Not the least plausible contention has been to the effect that the whole country should be annexed, and that its warlike population should, like the Sikhs, add to the strength of the Indian army. Such an enterprise might have been accomplished by a Viceroy of the capacity and character of WELLESLEY or DALHOUSIE, before the invention of telegraphy, and while the House of Commons, with its democratic constituencies, practised no habitual interference with Indian affairs. It is not impossible that the Afghans might have been converted into guardians of the Northern frontier; but recent experience has shown that the preliminary condition of reducing them to submission would not be easily satisfied. No similarly ambitious enterprise can be undertaken by Governments largely dependent on popular agitation and caprice. The more modest project of establishing a preponderating influence at Cabul has proved to be unexpectedly difficult. It is not yet certain whether an abandonment of political relations will be as safe as it seems to be inglorious. Lord ELLENBOROUGH at the end of the former Afghan war first hesitated to advance to Cabul; and then evacuated the country at the earliest possible moment. His policy was neither bold nor magnanimous; but POLLOCK and NOTT left behind them no defeated army and no besieged garrison. The Afghans then scarcely admitted that the English had reasserted their military superiority. They will now boast, not without reason, that their obstinate resistance has finally prevailed. Nothing has been less satisfactory than late transactions in respect of the entire falsification of all professional predictions. The soldiers and politicians who promoted the war always asserted that the task would be easy, and their opponents agreed with them in describing the Afghans as inconsiderable enemies. The first advance on Cabul seemed to confirm the anticipations of military opponents; and ROBERTS in his short campaign, after the violation of the Treaty of Gundamuk, dispersed without serious loss the numerous army which made a show of resistance at Charasiab. Since that time a formidable attack has been made on the garrison of Cabul; Sir DONALD STEWART met with determined opposition in his march on Ghuznee; and on the Helmund an English brigade has been ruinously defeated in a pitched battle. It will be necessary to recur to former estimates of the military qualities of the Afghans.

THE MEETING OF THE EMPERORS.

THE German EMPEROR and the Emperor of AUSTRIA met at Ischl, and, as it seemed uninteresting to look on this meeting as a mere interchange of courtesies, speculation has been busy with discovering recondite reasons for the visit of the aged EMPEROR to his old enemy and new ally. Count MOLTKE was present at Ischl, and so were the Princes of ROUMANIA and SERVIA, and it has been argued that such persons could not have been at Ischl for nothing. What the EMPERORS could be imagined to have to discuss and settle appears to have been beyond the imagination of speculators. It is simpler to rest satisfied with what is obvious and incontestable, and to leave time to reveal any reasons for the meeting which may possibly be hidden. The German EMPEROR has obviously and incontestably wished to pay a visit of civility which would at once indicate the healing of old sores, and the cementing of a new and intimate alliance. For years there was a bitter rivalry between Prussia and Austria, which only went partially to sleep when Austria thought her supremacy assured, and Prussia was too meek to contest it in any open way. This passive state of things ended on the day when Prince BISMARCK quietly showed that if the Austrian representative at Frankfort smoked he would smoke too. Prussia began to assert herself, and went on asserting herself, and asserting herself, until the day of Sadowa came and her rival lay in the dust at her feet. This triumph of Prussia is, in appearance at least, forgiven. Austria, which was prevented by Russia from seeking in the war between France and Germany an opportunity of revenge, is now leagued with Germany against Russia. Common interests are the basis of the alliance; but even if these common interests did not draw the Emperors together, the Emperor of AUSTRIA has too often shown how cordially and generously he can treat old foes to make it in any way surprising that he should give an honest and hearty welcome to the German EMPEROR. He has become the popular King of the Hungarians whom he once got Russia to conquer for him, and harassed with his own troops when they were conquered. He went to visit VICTOR EMMANUEL at Venice, the jewel that had been torn from his crown by a successful combination of audacity and intrigue. Even if Prince BISMARCK had not last autumn invented the new alliance, the German EMPEROR might have very well wished to visit Austria once more before he died, and would have been sure to have been treated as an honoured guest when he came. But a new alliance has been formed, and the Sovereigns in whose name it has been made naturally desire to give to the world a manifest proof that they heartily accept it. The real character and consequences of this alliance depend only slightly on the views

and wishes of the Sovereigns themselves. In a somewhat greater degree they depend on the views and wishes of the indispensable advisers on whom the Sovereigns lean. In the main they depend on the turn of events and on the general situation of Europe.

The alliance between Austria and Germany has hitherto been beneficial to Europe, and is readily accepted in both countries. But while it is much more ostentatiously prized by Germany than by Austria, it is to Austria that the good it has done has been chiefly due. In Germany it represents a policy of panic, and in Austria a policy of patience and moderation. The most striking feature of German society of the present moment is the state of fright which has become habitual to it. Some months ago Prince BISMARCK instructed the Germans to be frightened, and they not only did as they were bid, but have gone on being frightened after he himself has allowed himself to appear tranquillized. Not a word can be spoken in France and not a regiment moved or reviewed in Russia without a tribe of anxious Germans explaining that now at last something very alarming and dangerous has taken place. The Austrians turn their thoughts in a different direction, and instead of fearing lest others should do something rash, are occupied with guarding against doing anything rash themselves. Austria is a confederation of very heterogeneous elements, and it is a confederation that it is very difficult to work. There are more Slavs in Austria than there are Germans and Magyars put together, and neither the Slavs nor the Magyars wish to see the German alliance so carried out as to make the German minority in Austria more predominant than it is now. All sections of the Austrian population concur in greatly preferring Austrian to Russian rule, and therefore all see in the German alliance a useful safeguard against Russia. But the great bulk of the mixed population dread anything like the German alliance leading to an overt hostility against Russia, and an upsetting of the balance of the Austrian system. For many reasons Austria is the country on the Continent which most sincerely wishes for peace, and least wishes to go further than she has gone already. The great advantage of the German alliance to her has been that it has given her breathing time in which to form her policy definitely, and express it, so that she has become conscious of having a policy and determined to adhere to it. Whether the issue of the new European concert will be success or failure no one can pretend to say. But up to the present time it has continued to exist, and the possibility of its existence is due, not so much to the change of Ministry in England, as to the expression and record of opinion in Austria. Recent debates, both in the Austrian and Hungarian Parliaments, have placed beyond doubt the fact that the subjects of the Emperor of AUSTRIA do not wish to go forward, and do not seek more territory or territorial influence. The Emperor of AUSTRIA, whether the German EMPEROR comes to see him or not, must take notice of this state of opinion and be guided by it.

On Thursday Sir CHARLES DILKE stated that the Government had received from certain quarters the suggestion that, in the event of Turkey consenting to carry out the terms prescribed by the Congress and by the Conference of Berlin, the Powers should place on record their intention not to demand further concessions, and he added that the Government saw no objection in principle to the suggestion. He was then asked whether the suggestion did not come from Austria, and he replied that it came from various quarters; but it may be safely assumed that the suggestion either came from Austria, or expresses the special wishes of Austria. If Austria wishes for such an intention to be recorded, Germany would be sure to support Austria, and if it is to be regarded in any way as an expression of the policy which the EMPERORS met at Ischl to talk over, it may be said to give something of a special meaning to the meeting. The difficulty is to see, not what are the objections to the suggestion, but what is to be supposed to be the good of it. If the SULTAN carries out everything he undertook at Berlin, and everything imposed on him by the Berlin Conference, it is hard to see what decent pretext the Powers could have for demanding further concessions. The declaration seems superfluous, for if the SULTAN does all that he is asked to do, the business in hand would seem to be finished. But, from an Austrian point of view, the declaration may seem to be not altogether valueless. Austria has just raised her representative at Constantinople to the rank of an Ambassador, and Baron CALICE has been charged on assuming his new office to express to the SULTAN the earnest wish of Austria to uphold his Empire. At the same time, no Power has pressed the SULTAN more earnestly than Austria to yield to the wishes of Europe. This Austria has done for her own sake quite as much as for the sake of Turkey. She fears that if things remain unsettled in Turkey she may be obliged to act when she does not wish to act. She sees in the present submission of the SULTAN her last guarantee that she will be permitted to remain as quiet as she wishes to remain. The SULTAN may be supposed to reply that one concession is always followed by the demand for another, and that therefore his yielding now will do neither him nor Austria any permanent good. To reassure the SULTAN and to make submission easier to him, Austria undertakes to procure from the Powers a pledge that in this case what the SULTAN dreads shall not happen. The use of the suggestion may thus be to smooth the path of Austrian diplomacy at Constantinople. But to Austrian eyes it may have a further use. It may serve as a formal exposition of the Austrian policy of abstention, and at the same time as a demand that, if Austria abstains from pushing forward in the Balkan peninsula, others shall abstain too. It thus amounts to a notice to Europe of the intentions of Austria and of the claims which she thinks her good and peaceful intentions give her; and viewed in this light, the suggestion cannot be said to be so meaningless and superfluous as it might seem at first.

THE BURIALS BILL.

MR. WOODALL, with the innocent recklessness of a new member, recommended the Burials Bill to the acceptance of the House of Commons on Thursday night by blandly assuring it, in his official character of a Committeeman of the Liberation Society, that he accepted all the spiteful, unmannerly abuse of the Church of England heaped upon it by such agitators as Dr. LANDELS, Mr. DALE, and Mr. SPURGEON. His sympathy with them was complete when they proclaimed that they valued an immediate lodgment in the churchyards only as the short way to the occupation of the "fortress"—the confiscation, that is, of the churches themselves. Mr. BRIGHT was too old and wary a politician to be so candid; but he was in high spirits over his coming triumph, so he could not resist going out of his way to recommend the adoption in England of the German practice of lending the churches—which there are State property—at different hours for the worship of different communions.

The 258 members who voted for Lord SELBORNE'S Bill cannot pretend that they had not received ample warning, not of what the LORD CHANCELLOR in his closet may have mused upon, but that to which his more active and wide-awake colleagues and the general body of their Dissenting allies intend to be the fruit of his musing. This is a matter upon which we have so often insisted that we should have been glad to have been spared this late necessity of again repeating the often told tale. But at the moment when the Burials Bill has at last become a Parliamentary certainty, and brought face to face as we are with such unexpected candour as to the real aim of the agitation, we must recall our readers' attention to considerations which have been re-endowed with the vigour of youth by the novelty of the circumstances which now bring them to the fore. The one uncontentious fact is that an Act must soon be placed upon the Statute Book, as to which one section of its supporters predict that it will be a bulwark of the Established Church, and the other section that it will be a substantial instalment of disestablishment. The bantling which can be so differently regarded by its friends and relations is clearly an abnormal creature, a changeling—a fairy imp, our ancestors would have said—and we are puzzled on the threshold as to its natural history. As introduced into the House of Lords it was simply our old friend Mr. OSBORNE MORGAN'S Bill in its latter and worse shape, only qualified by the so-called Convocation clause, and made more sharp and irritating by the abolition of consecrated cemeteries. The peers struck out the latter innovation, and brought the measure substantially back to the form in which for many years Mr. OSBORNE MORGAN had himself advocated it—namely, as not applicable to parishes which had access to cemeteries, though strong in their radical support the

Government, while obstinately refusing to accept any of the real mitigations introduced into the measure in the Upper House, make a bravo show of resisting their free-lances, and standing out for the retention of certain illusory provisions of their own wherewith they had bird-limed the measure for the capture of credulous ecclesiastics. The House was gravely informed that the maintenance of the word "Christian" as the definition and limit of allowable services, was a proper concession to an overwhelming public opinion, and some members probably asked themselves how it happened that the Ministers had taken until August to reach a conclusion which might have been so serviceable in May, when the seat of the junior member for Northampton was in question.

Mr. BRIGHT would not be outdone in politeness by the JUDGE ADVOCATE-GENERAL, for he was so anxious to pay some pretty compliment to the Archbishop of CANTERBURY, whose help he very handsomely acknowledged, as to confess that he was schooling himself even to swallow a reference to Convocation in an Act of Parliament. Had Mr. BRIGHT more fully comprehended the value of that reference, he might have found his task more easy. The motive cause of that singular piece of legislation, the Convocation clause, was a double grievance, under which the great body of the clergy are now suffering. The more recent grievance is, that they are under *duresse* from those of their ecclesiastical superiors who are of a philosophic turn, to adopt a burial service of some kind or other for use over unbaptized persons, their own common sense telling them all the while that the penalty of silent burial for neglect of that sacrament is a wholesome incentive to people in general not to delay or reject Baptism. The other and older grievance is the compulsion of having to use the Burial Service over unworthy subjects.

Convocation, in its recent revision of the rubrics on the lines of the Ritual Commission, undertook to grapple with both these difficulties as part of the general question, and its recommendation, *valeat quantum*, was one of a complete scheme of amended rubrics, which were not only to stand or fall together, but were not to stand at all except as a schedule to an Act, providing a new and easy form of legislating for the future in regard to rubrics. Outside of these limitations, the recommendations, one and all, were to be no recommendations at all. The Government, with this state of things before it, now professes lip-service to Convocation by wrenching the schedule of rubrics from the covering Bill, and then selecting two or three isolated recommendations from the schedule itself, and after this it calls upon Parliament to accept, as the voice of Convocation, provisions which in that isolated shape Convocation would have withdrawn and repudiated, the more important one of them being a rubric which, while put forward by the Convocation of Canterbury, had been rejected by that of York. Of the recommendations in themselves, all we care to say is that they show more piety than grasp of human nature, for they profess to weight the permission to the clergyman to use the second-class service (a *post-mortem* excommunication) over the sinner only with consent of his friends, or, in other words, most likely his accomplices in ill-doing. This device was once the suggestion of Convocation, now it is the mandate of Mr. GLADSTONE and Lord SELBORNE, of Mr. BRIGHT and Mr. OSBORNE MORGAN. The Government must think the Church very simple indeed if it fancies that it will accept this illusory privilege and the undefinable term "Christian" as adequate compensation for the loss of the churchyards.

THE FINANCIAL POSITION IN INDIA.

LORD HARTINGTON'S Indian Budget speech is naturally awaited with curiosity. Every one will be glad to learn, on unimpeachable authority, the effects of the Afghan war on the finance of India, and the share of the burden which the English taxpayer will be called to bear. The prophets of evil, who see in each new phase of Indian history a new ground for despondency and a fresh topic for sensational denunciation, are no doubt looking forward to a revelation which may justify their forebodings, and put the stamp of official sanction on the gloomy prospect of insolvency which their inner vision has for so long beheld; and those politicians with whom questions of Indian administration are interesting only as material for a party fight, anticipate with exultation an impressive exposure of the lengths of mismanagement to which a Conservative Viceroy has been allowed to go. There are, however, we venture to believe, some Englishmen who watch the course of Indian events with other and deeper interest than that of Parliamentary partisanship, and who have a serious desire that England's great task of Eastern Empire should be exercised with honour to the rulers and benefit to the ruled. To such persons Indian questions are too often a wearisome enigma, beset with bewildering technicalities, shrouded from the ordinary intelligence in clouds of obscure detail, confusing enough in the first instance, from the nature of the subject, but still more hopelessly confounded by the exaggerations, distortions, suppressions, and misrepresentations of rival controversialists. The worst of all these enigmas is finance. Is India rapidly lapsing into bankruptcy, or increasing yearly in solid national wealth, are its inhabitants ground down by cruel taxation and scourged by famines more frequent and more disastrous than of old, or are they prospering in a fashion that, in all its long centuries of misrule and oppression, the country has never known? Will the expenses of the Afghan war put the last straw on the already overladen camel's back, and precipitate an inevitable collapse, or will the resources of a well-supplied and well-managed exchequer make it possible to bear the strain of three years' war without present embarrassment or future burthen? Each proposition has its passionate supporters, and it may be convenient if, among the Babel of conflicting assertions, we place on record some simple facts which throw light on the subject, and which the recently published *Correspondence on the Afghan War Estimate* has placed beyond the reach of contradiction.

Mr. H. WATERFIELD, the Financial Secretary at the India Office, has been obliging enough to append a memorandum, summarizing the somewhat perplexing series of telegrams and despatches in which the financial results of the campaign are brought to light; and with his aid we get a clear view of the financial position of the Indian Government, based, however, on the assumption that we quit Afghanistan in October. What fresh expense the last new phase of the war may involve it is of course impossible at present to conjecture. Apart, however, from this, the probable war expenditure appears, according to the latest estimates, to be as follows. In the original estimate the outlay on the war had been reckoned at 6 millions sterling up to April 1881. According to the new estimates, the gross outlay up to that date will be 15 millions, or an excess of 9 millions over the former estimate. From this, however, a deduction—possibly of a million sterling—may have to be made on account of increased earnings of railways and telegraphs, owing to the military operations, thus bringing the net cost to 14 millions. It is satisfactory to learn that the addition of nine millions to the war charges does not by any means imply an actual addition of nine millions to the expenditure of the years 1879-80 and 1880-81. The sum of 5½ millions had already, Mr. WATERFIELD points out, been brought to account in the "Statement of Receipts and Disbursements" for 1879-80 (*Correspondence on the Afghan War Estimate*, p. 46), under other headings; and all that is necessary in order to show the real outlay is to transfer it from those headings to that of "Imperial expenditure." This would bring the recorded military outlay up to the 31st March, 1880, to nearly 9½ millions, leaving 5½ millions to be provided for in 1880-81. Of this sum 2 millions were provided by the original estimates of that year, so that there are 3½ millions additional to be met, which is reduced by other causes to 3,370,000*l.* But, besides this, the balance with which the year 1880-1 commenced was lower by 1,183,000*l.* than originally estimated, so that altogether the position was worse by 4½ millions. To meet this the Government opened a loan which produced something over 3 millions, and it appears to be expected that the SECRETARY of STATE'S drawings for the year will be reduced by 1,900,000*l.* These two measures will give relief to the extent of 5,100,000*l.*, and if they are carried out, the closing balance of the year in India will, it is thought, be about half a million more than was contemplated in the original estimate.

The effect of the error in the war estimate will, according to these calculations, be that 3,130,000*l.* have been borrowed in India, and two millions will probably have to be borrowed in England to replace the SECRETARY OF STATE'S drafts: from this 5 millions of increased debt the increased balance of half a million must, in order to

get a correct view of the position, be deducted, leaving a net increase of 4½ millions of debt. Against this, however, may fairly be set the 4¼ millions which will have been spent out of the revenues of the two years on the frontier railways. These works are of the highest strategical importance, and will, it is impossible to doubt, earn the interest on their capital over and over again, not perhaps in dividends, but in diminished transport and commissariat expenses, in shortened campaigns and lessened armaments. Their construction with borrowed capital would at no time have been open to cavil, and it is certainly no small achievement for an Exchequer, so beset with other difficulties as that of the Indian Government, to have found the ways and means for an expenditure of 19¼ millions on war and military railways with no other extraneous help than a loan for a public work of acknowledged necessity and advantage, which would even in time of peace have been regarded as entirely justifiable. Small as the addition to the public debt has been, the increase to the annual interest charge will be still less considerable. The fresh debt of the present year would involve an annual payment of about 220,000*l.*; but there will, on the other hand—so we gather from the accounts—be a reduction of about 80,000*l.* in the general interest charge, due to conversions of securities at high interest to loans at lower rates; while the earnings of the productive public works—on which 11½ millions will have been spent in the three years—will hereafter, no doubt, more than suffice to counterbalance any increased payment for interest which the borrowings of the year may necessitate. The three years of war, accordingly, will, if the campaign closes next October, leave the country with no additional debt, other than one which might under any circumstances have been legitimately contracted, and with no addition to the annual charge for interest; meanwhile, the depreciation of silver will have cost the Government 9 millions, the relief of famine half a million, besides 14 millions of military expenditure, and 4¼ millio laid out in frontier railways. In the face of these figures—and unless we misunderstand the purport of the correspondence they are incontrovertible—it seems to us difficult to argue gravely with those who confidently assure us that India has an empty exchequer, an inelastic revenue, and a beggared population. Certainly if these grave maladies exist, never were the symptoms of their existence less apparent, or had those who believe in the financial prosperity of the Empire better and more convincing grounds to show for their belief. A Government which, in the three years following the greatest famine of the century, can show a surplus of ten millions of normal revenue over its entire peace expenditure, can surely look forward to the possible difficulties of the future with courage and hopefulness. The margin of revenue which in 1877-8 the Government determined to provide, with a view to famine relief and other abnormal expenditure, has indeed been utilized otherwise and more speedily than was expected; but it has performed its function in preventing an otherwise inevitable accumulation of debt; and if only the present drain on her resources be stayed and a few more favourable seasons be granted to her, India is likely to enjoy for the future an income so ample as to allow of the most complete provision for future famine relief, and at the same time of wide reaching fiscal reform and material relief to the taxpayer. Difficulties and dangers the rulers of India must no doubt at all times be prepared to meet, but the successors of Lord Lytton and Sir John Strachey will not, in our opinion, find financial embarrassments among the problems which they are called to solve. We have no care to apologize for the fault of system or delinquency of individuals which resulted in so grave an error in the war estimates of last February, but we are none the less convinced that the present financial position of the Government is in a high degree satisfactory, and such as to entitle the administrators of Indian finance to the respect and gratitude of their countrymen.

THE STATE OF IRELAND.

NOTWITHSTANDING the despatch of a body of Marines to Ireland, which may probably have been a prudent measure, there is no reason to suppose that the rejection of the Disturbance Bill has increased the difficulty of maintaining order. The wildest and most unscrupulous declamation against the House of Lords proceeds from English Radicals, and especially from those of the virtuous and sentimental school. For the purpose of exciting odium against the Peers, candid writers include them in a common censure with the peasants whom Mr. Parnell exhorts to keep a firm grasp on the land. Both classes are described in the *Spectator*, as forming Trades-Unions for the exclusive promotion of their own several interests. The difference between those who repudiate contracts and an Assembly which only proposes to enforce performances of contracts, is too slight to be recognized by democratic philanthropy. It is difficult to assume that every member of the majority was thinking, when he voted, not of law, of right, or of political expediency, but of his own rent-roll and estates, which were no doubt indirectly threatened by Mr. Forster's unjustifiable measure. Trades-Unions, whether their action is mischievous or beneficent, are not established for the assertion of the right of the artisan to receive his stipulated wages; while the most mercenary peer who voted against the Disturbance Bill, even if he were actuated by exclusive concern for his own interests, can have hoped only to protect his property from spoliation; yet it is positively asserted that the motives of the House of Lords were no less sordid than those of the fraudulent Irish tenants who combine to cheat their landlords. Lord Grey, Lord Lansdowne, and Lord Cairns were utterly insincere when they used arguments which nevertheless appeared conclusive to most of those who heard or read their speeches. Even Lord Derby shared in the sordid impulses of the Opposition when he exposed the vicious principle of the Bill, and the Duke of Argyll when he protested against further interference with the rights of property. Baser and more unfounded calumnies have never been prompted by factious disappointment. An obscure Radical Club in London has presented a petition to the House of Commons to the effect that it is inexpedient that public business should be at the mercy of hereditary and irresponsible legislators. The Speaker, in answer to a question, stated that he did not understand the petition to be an attack on the House of Lords. Although it is not known that there are any other hereditary legislators in England, the petition was apparently directed against Trades-Unions.

Mr. Parnell, in a speech delivered at Newcastle to the Home Rule Association of Great Britain, professed to regard the defeat of the Bill with a kind of complacent regret. It was, according to his description, a very small measure, but it indicated the goodwill of the Government to Ireland; and, while it was pending, Mr. Parnell feared that it might tend to discountenance the agitation of the Land League. His followers in Ireland are of a disposition so mild and so confiding that a small concession might perhaps relax the firm grip they hold of the land, and which, by the machinery of threats of assaults and murders, they sometimes compel their neighbours to hold. They have now once more received notice that they have nothing to hope from the English Parliament, and they will proceed to right themselves. Mr. Parnell promises in their name that the agitation against landlords shall continue with increased vigour, encouraged by the approval which the Cabinet and a majority of the House of Commons has given to their claims. He calls attention to the significant fact that the majority of sixty consisted of Irish members. The Government has by its judicious policy already disintegrated the Liberal party, on which Lord Hartington relied, as a security against dependence on the Home-Rule members. Mr. Parnell confidently anticipates an increase of evictions by landlords who will say, "This is our last chance of clearing the land and "getting it into our own possession . . . Let us make "hay while the sun shines, and during this wintry "weather let us exterminate our tenants." The antithesis between metaphorical or proverbial sunshine and actual frost and snow is in the most characteristic style of Irish rhetoric. Before Mr. Parnell conjecturally described the conduct of the landlords, he spoke with better authority on behalf of the tenants. "The fire which was lit last May "in Mayo," which is a figure of speech for refusal to pay rent, "will be intensified a hundredfold and will be "carried into every corner of every county in Ireland." There is no doubt that the present agitation is more dangerous than any of the successive conspiracies which have been promoted by Irish demagogues. The immediate gain to be acquired by refusing payment of a just

debt is more intelligible than the vague expectations which are connected with an Irish Parliament. Mr. PARNELL was supported by Mr. ISAAC NELSON, Mr. BARRY, and Mr. JUSTIN M'CARTHY, who has lately for the first time thought fit to ally himself with the extreme section of the Home Rule party. Mr. BARRY reminded the meeting of "the short and terrible manner in which the "French people settled the land question." The Irish from time to time settle their local land question as shortly and as violently; and an Irish Parliament elected by occupiers might perhaps be not less bloodthirsty than the French Convention.

The Disturbance Bill, if it had become law, would have been quoted by agitators as a Parliamentary recognition of the indefensible property of the tenant in the soil. If the principle were once admitted of legislative suspension of debts due to the landlord, the clamour for the extension of interference would have been difficult to resist. The speeches of Lord DERBY and Lord EMLY might have been quoted to prove that the area covered by the Schedules of the Bill was far greater than that of present agricultural distress. Indeed, the evictions have been more numerous in Ulster and Leinster than in Connaught and Munster. One of the inconveniences of partial and occasional anomalies is that they tend to become precedents. The Land Act of 1870 was at the time said to be wholly exceptional; but after ten years it had become pregnant with germs of organic and undefined change. Mr. FORSTER's less comprehensive measure involved a more dangerous theory, which was propounded in the simplest form by some of his supporters. Mr. SHAW-LEFEVRE's contention that contracts in Ireland should be interpreted by French or Italian law, illustrated the confusion of mind which ensues from attempts to combine spoliation with the maintenance of any kind of property. Mr. GLADSTONE and Mr. FORSTER in the course of the debates on the Disturbance Bill more than once announced their intention to introduce a permanent Land Bill in the next Session. As the Duke of ARGYLL pledged himself to oppose further attempts to tamper with the rights of property, it may be inferred that the Cabinet has not yet assented to any revolutionary measure. Lord HARTINGTON also significantly declared that the inquiry into the operation of the Land Bill was undertaken for the purpose of ascertaining whether it should be enlarged or restricted. The sordid motives of the Tory Trades Union are not confined to one party. Mr. PARNELL had some reason for attacking the moderate Liberals; and Mr. BARRY had the pleasure of repeating O'CONNELL's coarse denunciation of "the base, "brutal, and bloody Whigs." Mr. JUSTIN M'CARTHY, who has written an able and temperate history of the present reign, must display some moral and intellectual versatility when he appears at such meetings as a follower of Mr. PARNELL.

There is a paradoxical impudence in the mere existence of a Home Rule Association of Great Britain. The members of the body have, of their own choice, settled in England, with, as far as the great majority are concerned, no purpose of returning. Many of them have, unfortunately, votes for the English boroughs in which they live, and yet their whole political strength is employed to weaken and dissolve the connexion between their adopted country and the country of their birth. At the bidding of Mr. PARNELL and other agitators they habitually disregard the good faith which is presumed as a condition in the exercise of the franchise. At the general election their leaders suspended the rule which enjoins on the Irish voters abstinence from the poll, except in favour of any candidate who may pledge himself to support Home Rule or an inquiry into Home Rule. In the judgment of the demagogues, the triumph of the Liberal party was deemed likely to facilitate the disruption of the United Kingdom. There is, no doubt, that a considerable number of members of the majority owe their seats to their presumed complicity with Mr. PARNELL and Mr. BIGGAR. The Ministers have, by the confession of the agitators themselves, not disappointed the expectations of their Irish allies; but they have failed to carry with them their moderate supporters. The Disturbance Bill was all but dependent on Home Rule votes in the House of Commons, and it was opposed by a majority of peers belonging to the Ministerial party. The managers have therefore reverted to the ordinary practice of demanding pledges from candidates. Mr. PLIMSOLL, warned perhaps by the experience of Lord RAMSAY, refused the test at Liverpool, and he was defeated; but it must be remembered that compliance with the demand was not less fatal to Lord RAMSAY. A mutinous club, or section of a club, which refused to submit to dictation and voted for Mr. PLIMSOLL, has been formally excommunicated, until it purges its contempt by submission. In the long run, the perverse selfishness of the Home Rule voters will create in other towns, as in Liverpool, a prejudice against the party which they now support. Mr. PARNELL is more innocently employed in consolidating their organization than in urging Irish tenants not to pay their rents. Before he proceeds to blow afresh the fire which he boasts of having kindled in Mayo, he and his supporters will perhaps once more exhibit their power of annoying the House of Commons. Some of them have announced their determination to oppose the votes for the maintenance of the Constabulary, except on the absurd condition that the police shall not be employed to protect process-servers in the discharge of their duty. Mr. FORSTER, in a spirited speech soon after the division in the House of Lords, declared his intention to discharge to the utmost the duty of protecting life and property, and repressing disorder. It will not be easy for agitators against payment of rents to avoid collision with the law.

AMERICAN CATTLE.

IT is a good thing in the present, and probably future, condition of the notice paper of the House of Commons to have one subject removed from it for some considerable time to come. Mr. ARNOLD has been the blessed, though unconscious, instrument of bringing this about. Nothing more, we venture to think, will immediately be heard of needless restrictions on the importation of cattle. This happy result could hardly have been attained with so much completeness if a Conservative Government had been in power, or even if a county member had held the office of Vice-President of the Committee of Council. When the defence of the existing law is undertaken by a Liberal Minister, and by a Liberal Minister who sits for a large town, then the full strength of the case can escape no one. The propriety of banishing diseased cattle from the English inland markets has never perhaps been so conclusively established as by Mr. MUNDELLA, because it has never before been placed so entirely in its true aspect as a question for meat-eaters and not for meat-growers. Notwithstanding the recent growth in the import of live meat, the proportion of native to foreign beasts remains overwhelming. Of the whole number of cattle slaughtered for consumption in this country scarcely 12½ per cent. comes from abroad. Mr. ARNOLD's modest proposal came to this—that in order to raise this 12½ per cent. to 13 or 14 per cent. the immunity from disease enjoyed by the remaining 87½ per cent. should be exchanged for perpetual risk and possible disaster. A more shortsighted suggestion, considered from the point of view of the consumer, can scarcely be imagined. Supposing that it were adopted and the natural result followed, something like a meat famine might be experienced in the course of a very few months. The 87½ per cent. would dwindle down under the influence of disease, and every beast that died would be so much meat withdrawn from the consumer's table. Mr. ARNOLD may perhaps persuade himself that the gaps in the home supply would be filled up by a corresponding increase in the foreign supply. The restrictions on importation having been removed, healthy as well as diseased cattle would come in as they happened to be wanted, and the consumer would eat as largely and as cheaply as ever, though no longer of English roast beef. Unfortunately, this is the dream of an enthusiast, not the opinion of an expert. What may be true at some distant day Mr. ARNOLD assumes to be true now. No doubt, if there were the cattle waiting to come in, they might come in more freely when the present restrictions were relaxed, and hereafter it is more than possible that the cattle will be waiting to come in. But they are not there now, and, until they are there, a deficiency in the home production will mean a deficiency in the total supply. There is no reason to suppose that, if the restrictions on importation from America were removed, there would be any material increase in the number of cattle sent over. With meat at its present price it is a very profitable business to export cattle to England, and when there is money to be made, the American producer is not likely to be

deterred from earning it by the provisions respecting compulsory slaughter. The imports of cattle from America during the first seven months of the present year have been nearly double those of the corresponding period last year. Americans are glad, Mr. MUNDELLA says, to send as many cattle as they can to this country, and we may be sure that the only thing that will prevent them from sending three times as many next year as they are sending this will be the fact that they have not got them to send. The first contention embodied in Mr. ARNOLD's resolution is absolutely baseless. There is no evidence that "the compulsory slaughter at the ports "of landing of fat stock from the United States of "America restricts the supply and increases the cost of "food."

The second contention—that, "having regard to the "freedom from disease of the stock producing States of "America," these restrictions should be modified or removed—was not more successful. If Mr. ARNOLD is right in his estimate of the condition in regard to disease of the United States, he must have information to which all the American authorities are refused access. They, at all events, have no knowledge of the freedom from disease of which Mr. ARNOLD speaks. The utmost alarm, it seems, prevails in the United States as to the prevalence of pleuro-pneumonia. The disease is no longer confined to the Eastern States in which it has hitherto been prevalent. It is continually spreading westwards, and when it really takes hold of the great cattle-producing territory, its ravages will, in all probability, be disastrous. This is the country from which Mr. ARNOLD wishes to see a fuller and freer importation of cattle into Great Britain. Or perhaps we ought in fairness to say this is the country from which Mr. ARNOLD wished to see a fuller and freer importation of cattle—till he heard Mr. MUNDELLA's speech. It is hardly possible that he can have continued to wish it after hearing it. During the present year two opposite processes have been at work, each pointing to the value of the existing regulations. The first is the marked decline of disease in home-grown cattle. The second is the marked increase of disease in imported cattle. During the years 1875-77, the cases of pleuro-pneumonia were over 5,000 annually. During the first six months of 1880 they have been only 1,401. On the other hand, there have been more than 200 cases of pleuro-pneumonia in the first seven months of 1880, against about 140 in the whole of 1879. It follows from this, first, that there is an increasing amount of disease among foreign cattle; and next, that the precautions actually taken by the Privy Council have made the cases among native cattle very much fewer than they were when there was less disease outside and fewer restrictions at home.

At the same time English farmers will not be acting wisely if they ignore the possibility that in course of time the American competition in meat will be fully as formidable as American competition in wheat has already shown itself. It is not long since that the supply of native cattle used to be estimated at 95 per cent. of the whole number slaughtered, leaving only 5 per cent. to be set down to foreign cattle. Now we hear that the home supply amounts to 87½, leaving 12½ for the foreign supply. Before long the proportions may be 75 and 25 per cent. A little later the two elements may about balance one another. Every year, on this theory, the interests of the English farmer and the English consumer will grow more antagonistic, until at length the interests of the consumer will plainly demand what the interests of the farmer will as plainly forbid—that the supplies of foreign beasts shall be admitted at all hazards. It is understood that the Report upon American competition which has lately been presented to the Agricultural Commission predicts that the rivalry in the supply of meat will be even more formidable than the rivalry in supply of wheat already is. If this opinion is sustained by sufficient evidence it would be simply cruel to encourage farmers to build upon raising stock the hopes which have been dashed as regards the growing of corn. It is bad to see one of the two principal industries with which he is familiar withdrawn from him by no fault of his own. It will be worse if in the end he sees the second industry—that to which he has betaken himself upon the failure of the first—rendered equally profitless. By all means let English farmers breed cattle while cattle-breeding still pays. But let them be not the less on their guard against the seemingly inevitable day when cattle-breeding shall pay no longer. Hard as it may be to find anything to take its place, there will, at all events, be more chance of the discovery being made if the need of making it is all along recognized.

TWO RAILWAY ACCIDENTS.

THE week which is for Londoners probably the greatest week of travelling in the year, has been marked by two very serious accidents, one on the North British and the other on the Midland line. At a time when so many people are travelling by railway, and when so many of those who travel are travelling for pleasure, it is impossible that the liability to accident, which is an element of all railway travelling, should not be brought home to the public in a special manner, and that the thought how easily a journey of pleasure may end in grave injury or death, should not in some degree affect the spirits of those who are setting out to enjoy their holidays. But, as it happens, these particular accidents were in only a very slight way connected with holiday traffic. The Flying Scotchman, when it suddenly became wrecked, was going, not to Edinburgh, but from it, and there were remarkably few passengers in the train. The Midland train was carrying some passengers from Leeds to the Lake district; but they were but few, and the train was an ordinary train running at the usual hour, and the catastrophe was not in any way due to that pressure which the running of extra pleasure traffic imposes on railway officials. It was probably because the Scotch train was so light that the number of persons injured may be said to have been small in view of the nearly complete destruction which the rolling-stock underwent. It is only because these accidents have happened at this particular period of the year that there has seemed to be a connexion between them and holiday-making. They were really nothing but incidents of ordinary railway travelling. And if they are regarded in this light, they may serve to remind the public, not so much of the dangers of railway travelling, but of the very remarkable degree of safety with which the enormous traffic on the main English lines is carried on. If we did not know how safe railway travelling is we should never guess that it could be made so safe as it is. There is not a more conspicuous triumph of human industry and vigilance than the success with which train after train is sent safely to its destination, in all weathers, at all seasons, and at every hour of the day and night. There is perhaps no uglier sight, but there is also no more impressive sight in the world than the network of rails at such a point as Clapham Junction. That hundreds of trains should thread this network safely every day and every night, in fog or sunshine, in snow or rain, is in its way a remarkable evidence of human progress. It must be remembered how very numerous are the modes in which an accident may happen on a railway. To run safely, the train itself must be fit to run, and this means that every wheel, every axle, every coupling, every part of the motive mechanism must be in the highest possible state of order. Then the road must be fit to run on, and this means that every rail must be sound, well laid, and securely fastened. When the train is started the road must be kept clear for it, every signal must be properly worked, every crossing must be handled so that the train shall go where it is meant to go. Even if man has done all that man can do, nature may conquer him. A sudden flood may wash away a bridge; a gale may drive waves over the line or sweep with unprecedented fury against an intervening obstacle; and yet, although the miles over which trains run in the United Kingdom may be reckoned by millions, there is scarcely ever an accident, and not at all frequently any delay or interruption in the service. We have not so many miles of railway as some other countries, but we make many times as much use of our railways as any other country makes. Every one desires that what is good should be made still better, and we are so accustomed to the excellence of our railway arrangement, that we forget its merits while we are alive to its defects. But when accidents happen we may not only ask who is to blame, but remember how little there is on the whole to blame, and with what admirable foresight, vigilance, and prudence our railway service is in the main conducted.

The Flying Scotchman from Edinburgh to London left Edinburgh on Tuesday at the usual hour of eleven, and

was timed to reach Berwick without stoppage at 11.15. It proceeded on its ordinary course until it arrived at a point four miles north of Berwick. There the line seems to have been under repair; the rails were down, but the process of finally fastening them had not been finished. Under such circumstances the roadway not being fitted for the passage of a train, any train coming in the direction which would force it to go over the faulty roadway, would in the usual course of things be either stopped until the roadway was made good, or would have been made to go over the dangerous point at a snail's pace. To send a train going at express speed over a roadway when the fastening of the rails had not been finished, was to expose it to certain destruction. It is stated that a danger signal had been exhibited, but that it happened to be so placed that the driver could not see it in time. Whether the driver saw it, and disregarded it, or only saw it when it was too late, cannot be known, as he was one of the victims of the accident. The nature of the catastrophe may be gathered from the description of an eye-witness, who describes the rails as having been torn up for a long distance, the engine and tender broken up, the carriages piled on the top of each other against the side of the cutting where the accident took place, and some of them reduced to matchwood. It is wonderful after reading this, to find that only the driver, the fireman, and one guard were killed, and that only one other guard and two passengers received severe injuries. But this is only in accordance with the general experience of railway travelling. The actual number of sufferers is ordinarily found to be surprisingly small even when the destruction of the train seems to be almost complete. If this is a correct account of what happened, it is evident that someone was very much to blame. What was done was quite out of the usual course of business on a well-conducted line. The train was one which passes the spot where the roadway was being repaired at the same hour every day in the year. It is not usual, but it is sometimes unavoidable, to repair the roadway in daylight, at a busy hour, and at an hour when an express train is expected. If such work had to be done, two precautions should have been taken as a matter of course. The fact that the line was being repaired should have been telegraphed to the station at which the train last stopped—that is, Edinburgh, and a warning should have been given not merely by exhibiting a danger signal, but by posting a watchman with a red flag a considerable distance down the line. It is so very much out of the usual course of business that these precautions should not have been taken that it is difficult not to suspect that the account given of the cause of the catastrophe is not accurate. It may also be remarked that none of those who have described the catastrophe seem to have noticed the presence of the men engaged in repairing the line. When these men saw what was going to happen they would naturally have done their best to save themselves, and might have succeeded. But it might be supposed that they would immediately come up to render all the assistance in their power, and the passengers who escaped injury could scarcely have failed to notice them. If the line was not under repair at the time, then the roadway must have been in a faulty state, for those who examined the line after the accident distinctly saw that the rails were not properly fastened. If the accident was due to the roadway having been left in an improper state, the negligence exhibited is of a much more dangerous and culpable character, than if the proper precautions were not taken under extraordinary circumstances. A defective roadway endangers all trains, and while it is not possible to ensure that all officials will act properly under unusual circumstances, it is quite easy to ensure that every rail over which traffic is meant to pass has been properly fastened.

The accident of Wednesday took place at Wennington Junction where the Midland line from Settle to Lancaster diverges from the line from Settle to Carnforth. The train that met with the accident was one running from Leeds and Bradford to Carnforth, and thence to Furness, and fortunately was not a heavy one, the total number of passengers being reckoned at about fifty. How the accident happened is still wrapped in mystery. All that is known is that somehow the engine left the rails. It was at first supposed that it was thrown off the line by some imperfection in the points at the crossing where the line to Furness leaves the line to Lancaster. But further inspection has shown that this cannot have been the case, as the spot where the engine left the mark of its having gone off the rails was some yards beyond the crossing. The couplings of the engine and tender broke, leaving the carriages detached, and it unfortunately happened that at the point where the break took place there was an over-road bridge. The engine and tender cleared this bridge, but the first carriage struck it, and this carriage and those immediately behind it were those in which the loss of life and the injuries to passengers took place. Seven passengers were killed and a dozen were more or less seriously injured, while, as an illustration of the extraordinary escapes as well of the great dangers of an accident, it is stated that not a single passenger from Leeds sustained any injury. So far as is known at present, it does not appear that any one was to blame. The Midland is one of the best-managed lines in the world, and that such an accident could happen on it only shows that no excellence of management can offer a security against all accidents. There must be accidents in railway travelling, although of all forms of locomotion devised by man it is much the safest, and all that can be done—and this has been done on the best English lines—is to reduce the number of accidents to the lowest possible point.

THE WATER SUPPLY OF LONDON.

LONDONERS are not accustomed to be told on authority that "the source, the nature, and the price of "the water supply of the Metropolis" is a subject "which "especially concerns the consumers of water." The language they have usually heard has been of an opposite kind. The Thames has been treated as a sacred fount, which it was impossible even to conceive as superseded without incurring the guilt of gross impiety. As a natural deduction from this first principle, a too curious inquiry into what Thames water is like has been carefully discouraged. As it is the water appointed by Providence for Londoners to drink, for them, at all events, it is the best water that can be drunk. Any wicked tendency to grumble at the price charged for it has been checked by an arrangement which drops the word price altogether. The money paid for imperfectly filtered Thames water is not a price, but a rate. There is a fine flavour of compulsion about the word which is fully borne out by the facts. Strictly speaking, of course there is no compulsion in the matter. No one is obliged to take Thames water unless he likes it. But the man who refused to take it would be worse off than Dr. TANNER during his recent fast, unless, indeed, he were extremely rich and extremely eccentric. To a Londoner, a final breach with his Water Company would mean speedy death or a life passed in washing in cans of sea-water, abstaining from boiled food, and drinking nothing but milk, mineral waters, and alcohol. Consequently, though the price paid for Thames water bears no relation to the cost of production, Londoners pay it, if not contentedly, at least uncomplainingly. Perhaps it even cheers them to call the price a rate, because it brings home to them more clearly the fact that pay it they must. As many marriages are fairly happy which would be wretched if they were dissoluble at pleasure, so the union between a Londoner and his Water Company has been endured because there seemed to be no help for it.

As everybody knows, the unwitting author of their divorce was Sir RICHARD CROSS. He proposed to execute a species of post-nuptial settlement, under which the gains made by the Water Companies and the burdens borne by the public would be stereotyped for the benefit of all future generations. The utmost income that the Water Companies had ever dreamed of making was treated as their natural and necessary earnings, and secured to them for ever. Then the London ratepayer awoke. Sir RICHARD CROSS had tried to deprive him of hope, to deny him the one joy left him—the joy of dreaming of a world in which science and legislation might combine to deliver him from the tyranny of Water Companies; and in so doing he had given the victim strength to break his chains. The Select Committee which has just presented its report was the result of the rebellion. The quotation with which we began shows the difference that exists between the views of the Committee and the views which have hitherto been taken by the recognized authorities on the subject. For the first time since the old wells were closed the supply of water has been treated as a consumers' question. When the agreements entered into with the

Companies under the authority of Sir RICHARD CROSS came to be examined in this aspect, it did not take long to dispose of them. The basis on which they rested was too innocently one-sided. The price to be paid to the Companies was calculated on the future value of their undertakings. The ratepayers were asked to pay, not what these undertakings are worth now, but what they may be worth some day or other. This future value was arrived at by a very simple process. "The calculation of increments," the Committee say, "was founded on the assumption that all the items of "receipt would grow at a greater rate in the future than "in the past; that the number and value of houses and "the rate of rentals would perpetually augment; but that, "on the other hand, the growth of capital expenditure, "which has hitherto been required in order to earn an "increased income, would sink almost to nothing." The Companies were to go on for ever using the old plant and giving the old water, but for these strictly limited services they were to receive a strictly unlimited income. The total cost of the existing water supply "has not much exceeded 12,000,000*l*., a considerable por-"tion of which sum may be attributed to works which "have become useless." But the total capital value which it was proposed to pay to the Companies was 33,000,000*l*., so that for every pound paid by the Companies in the first instance they were to receive nearly three pounds, and this without regard to the facts that the original value of the plant had not been maintained and that the consumer had just reason to be dissatisfied with the article supplied. Holding this opinion of the bargain Sir RICHARD CROSS proposed to conclude, the Committee naturally remark that the terms contained in these agreements "do not furnish a satisfactory or admissible basis "of purchase."

The method in which the Committee propose to deal with the question is practical and satisfactory. As neither the HOME SECRETARY nor Parliament can perpetually be busy with the regulation of the London water supply, the first step is to find or make some authority to regulate it. If the water supply of Liverpool or Manchester were in question, no doubt could arise as to what this authority should be. These cities have a municipality, and the municipality is the natural representative of the citizens for all purposes. Hereafter, indeed, it is possible that the area from which the water supply of these great towns is derived may be so large or so far off that it will not be just to other districts to leave their water interests entirely at the mercy of distant municipalities. In London, however, the need of creating a new Water Trust of some kind is immediate. There is no municipality to which the work can be committed. There is a corporation which might fitly charge itself with the supply of water to the metropolis, if the metropolis meant only the City of London. There is a Board of Works which might fitly charge itself with the supply of water to the metropolis if the metropolis meant only the metropolitan district outside the city. But the metropolis means both these and something more besides. If London should ever be governed on a different method, and a Corporation elected by the whole metropolis should take the place of the present Corporation and the Board of Works, the functions of any Water Trust which may be created in pursuance of the Committee's recommendation would naturally determine. The water supply would then be regulated by a Committee of the municipality. But there is no need to remain in subjection to the Companies until that time shall arrive. There is justification enough for the recommendation of the Committee in the fact that at present there is no municipal body common to the whole of London, and that it is impossible to say positively when such a municipal body will come into being. In the possibly long interval before its creation the water supply of London must either go uncared for or be entrusted to some new authority. As to the constitution of such an authority, the Committee merely say that the Corporation and the Board of Works ought to be represented in it, and that the districts supplied by the Water Companies, but not under the jurisdiction of either of these bodies, should have some voice in its election.

The duties of the proposed Water Trust would, at the outset, be mainly three. They would have to consider whether the existing undertakings shall be purchased, or regulated, or superseded. Probably these alternatives do not wholly exclude one another. The existing undertakings might be purchased for one purpose, regulated for a second, and superseded for a third. For example, the distinction once so familiar to housekeepers between the hard and the soft water cisterns might be revived, and while the Thames continued to supply London with water for washing and extinguishing fires—these two items standing for by far the larger part of the water consumed—water for drinking might be drawn from some purer source. In that case the present undertakings might properly be bought or subjected to new regulations for the former purposes, while a wholly new undertaking might be created for the latter. It is certainly time that the decision of these and similar questions should no longer rest with a body so essentially unfitted to deal with them as the Imperial Parliament. If they are mismanaged by the proposed Water Trust, it will be the fault of the consumers themselves.

THE MILITARY SITUATION IN AFGHANISTAN.

IT is an unfortunate, if perhaps an unavoidable result of the prevalence of strong party feeling, that this feeling is introduced into matters with which it has absolutely nothing to do. This truism has never been better illustrated than by the comments which have been passed on the disaster near Candahar, and the subsequent measures of the Indian Government. On the one hand the defeat of General Burrows has been attributed to the policy of Mr. Gladstone both at home and abroad, whereas the stoutest Tory, who happens to be possessed of the facts, knows that the Government is as innocent of it as Lord Lytton or Lord Salisbury. On the other hand, it has been used as an argument against the Afghan policy of the late Government, and especially against the British maintenance of influence over Candahar, although with the latter point at least it has nothing to do whatever. A sober survey of the facts is therefore of particular importance at the present moment, and though it is impossible to say that those facts are known in the fullest detail, there is yet sufficient information available to make a tolerably accurate and intelligible view of the situation possible. On the 27th of last month a force of invaders whose approach had long been known was attacked by a British brigade under General Burrows, which brigade formed the advanced portion of the force occupying Candahar and the southern districts of Afghanistan. That force consisted in all of nearly ten thousand men, but was very much divided. Nearly half of it was scattered over a variety of posts leading to India by the railway recently constructed towards the Bolan to Quetta and Candahar, or in the neighbouring districts. A whole native regiment, with two companies of English infantry and other troops, occupied the town of Kelat-i-Ghilzai, between Candahar and Ghuznee. About two thousand men under General Primrose, the senior officer of the whole force, occupied Candahar itself. General Primrose had as his brigadiers General Burrows and Brooke, and the former had at the beginning of the month been sent forward with a force of about two thousand six hundred men of all arms to co-operate with Shere Ali, the Wali of Candahar, in repulsing the invasion threatened by Ayoub Khan, the ruler of Herat. Before coming to blows with Ayoub, but after reaching what may be called the boundary stream of the Helmund, the Candahar troops had broken out into open mutiny. They were attacked and dispersed, not without a rather unintelligible amount of hesitation, by a detachment of General Burrows's troops, and the latter was thus reduced to depend on his own brigade, with the possible addition of some Candahar horse. The *contretemps* altered General Burrows's plan, and, instead of advancing to meet Ayoub, he fell back to a place called Kushk-i-Nakhud, about half way between the Helmund and Candahar, assuming a position supposed to have advantages as protecting him from Ayoub's cavalry, in which arm the invaders were very strong and the English force very weak. General Burrows had with him no English cavalry, and no European troops, save the 66th Regiment (less the two companies absent at Kelat-i-Ghilzai) and half a battery of Horse Artillery. The rest of his force was made up of two regiments of Bombay foot and of one regiment and a squadron or two of Bombay horse. Ayoub's force was very imperfectly known, but it was said to have been strengthened by considerable numbers (two thousand at least) of the fanatic swordsmen known as Ghazis, to possess at least as many regimented cavalry, and to have no less than thirty-six guns. The odds were therefore heavy against General Burrows, especially in artillery, even if we suppose, according to some private letters that have been made public, that the six guns given to the Wali of Candahar, which were first seized by and then recovered from the mutineers, were worked along with the half battery of Horse Artillery in the action. However this may be, the action itself was begun by the English General, who left his position and sent his cavalry and artillery to engage the enemy. Even now no definite intelligence is forthcoming of the behaviour of the Bombay Horse; but from the small loss they sustained, and the absence of any mention of them as protecting the subsequent retreat, it is to be feared that they did not distinguish themselves. The artillery was completely overmatched, and the loss of all its officers and, probably, two-thirds of the men, tells its own tale. After some hours of this, the infantry of

the two forces came to blows. The Ghazis charged in their usual reckless manner, and struck such terror into the Bombay Infantry that one account says they did not even wait for their antagonists. In flying they threw the 66th into confusion in its turn, and the battle became a mere rout. The latest and least despondent accounts acknowledge a loss of over a thousand men. It still has to be explained why a general who is believed to have little experience of active service was put on so responsible a duty; why, after the mutiny, reinforcements were not sent up to him; why he neglected the obvious means of informing himself of his adversary's strength; why, if he knew that strength, he risked an attack; why that attack was begun "according to Cocker," but in utter disregard of the relative force, by half a battery of artillery against six batteries; and, lastly, why the assault of the Ghazis, the danger of which was perfectly well known, was allowed to fall upon the Bombay troops, and not upon the English regiment, who would no doubt have given a good account of it? All these questions are fairly suggested by the official despatches. They demand an answer, and they have certainly as yet not received one.

Immediately after the battle Candahar was put into a state of defence, and the fugitives of General Burrows's force, with the troops retained in the city by General Primrose, constituted a force a good deal stronger than that which fought at Kushk-i-Nakhud, and according to one account not much short of four thousand strong. Unfortunately the loss of European troops had been relatively so heavy that the composition of this force affected its strength. General Primrose therefore confined himself to occupying the citadel and strengthening it and the town as best he could. Ayoub, however, seems either to have been paralysed by his doubtless heavy losses in the battle, or, which is more likely, to have been unable to decide on a course of action. Dissensions between his Cabulee and Heratee troops are spoken of and are not improbable. Had he at once attacked Candahar, to within a few miles of which town the pursuit was continued, he would at least have had some chance of success. Had he passed it by and hurried on to the Quetta road, the weak posts at Chaman and elsewhere might probably have been overpowered. Had he gone across country to Kelat-i-Ghilzai he might have added another success to his score by surprising the thousand men or so who garrison that place. But he remained certainly more than a week in the neighbourhood of the battle-field, and this delay must be held to have put an end to his chances as far as any serious annoyance to ourselves is concerned. Troops under General Phayre are hurrying up to Quetta for an advance on Chaman and Candahar, and there seems to be nothing to prevent such a reinforcement shortly reaching General Primrose as would even entitle him to meet Ayoub in the open, though the unsatisfactory behaviour of the Bombay troops will probably prevent the assumption of the offensive with any army mainly composed of them just yet, while the road at present open to the assaults of the tribesmen—must be carefully guarded. It would even seem very probable that Candahar will not after all have to stand a siege. The chances of such a siege would now be very small. General Primrose has men enough not merely to repulse any attack on the citadel, but to secure his water supply and to make an attack on any part of the city a very risky proceeding. Ayoub may still attempt Chaman, but it would not be surprising to hear of his retirement towards Herat. In that case the reckoning with him will probably be left to General Roberts, who is advancing with a powerful force from Cabul *viâ* Ghuznee and Kelat-i-Ghilzai. The despatch of this force has been a good deal criticized, especially by Sir W. Palliser in the House of Commons. It is said that we need all our strength in Northern Afghanistan, that the retirement from Cabul, and the consequent drawing back of General Roberts's base still farther, makes his position dangerous, and that in the face of large gatherings of the warlike tribesmen of the centre, that position would be more dangerous still. It must be remembered, however, that this force is strictly a flying column, that it therefore hardly needs a "base" in the usual sense, and that, to speak paradoxically, its goal, not its starting point, is the base it must look to. It need not weaken itself with the occupation of any posts on the way, it carries its own necessaries with it, and has simply to find and beat a given enemy, not to establish English supremacy over any particular part of the country. It is, moreover, as we have said, relatively a very strong force. Nine thousand combatants, of whom nearly a third are Englishmen, with eighteen guns, and consisting entirely of the best troops, native and European, inured to Afghan war and led by a successful and popular general, ought to make an example of any army that could possibly be brought against them. General Stewart was not half as strong when he defeated fifteen thousand Afghans at Ahmed Kheyl in the spring, and he was burdened with heavy baggage and impedimenta of all sorts. That no tribal gathering can stop General Roberts, and that Ayoub, if he ever comes to blows with this force, will be beaten, may be taken to be as nearly a certainty as anything can be. That Ayoub will not wait for it is probable, and the question then occurs whether General Roberts will be ordered to follow him up to Herat or not. Ayoub's own march with thirty-six guns on Candahar shows that the difficulties of this journey have been much exaggerated; but the very name of Herat is a red rag to the political party whose counsels are perhaps most likely to be heard by the present Government. But, if there is one thing certain, it is that it will not do to leave Kushk-i-Nakhud unavenged, and that, if Ayoub will not come to give us our revenge, we must go and give it him. The failure of the Bombay troops to meet the Afghans is a serious matter, no doubt. But it is only just to remember the exceedingly unfair terms on which they appear to have been exposed to the enemy, and the fatal stinginess with which they were furnished with European officers. Seven officers is the outside allowance to each regiment, and this allows not merely no margin for the effect of hard fighting, but none for the merest accident. If the Bombay sepoy and sowar is inferior, man for man, to the Afghan, of which there is little doubt, all the more is it necessary that he should be amply led by Europeans. Seven men, even if they were invulnerable and warranted against disease, can hardly do the leading required by seven or eight hundred, when they have to face a sword-in-hand charge made by superior numbers of athletic fanatics.

On the whole, therefore, while there is too much reason to fear that the more we hear of Kushk-i-Nakhud the less creditable will it be to the reputation of the persons chiefly concerned, there does not seem to be much fear of multiplied disaster. Ayoub's unintelligible hesitation has in all probability saved, not merely Candahar, but also Kelat-i-Ghilzai, of which satisfactory news has at length been received, and Chaman. Though the various items of the British forces are still disagreeably severed the one from the other, every day ought to bring them nearer to reunion, and to increase the power of resistance of the separate parts. Supposing that Ayoub's inaction does not continue, there is nothing very much to fear for either of the more exposed points, and supposing that it does continue, the second week in September will see twenty thousand British troops at Candahar, with Kelat-i-Ghilzai relieved, the road to Quetta thoroughly garrisoned, and everything ready for any measures which it may then be thought proper to adopt. It is true that no one knows what may by this time have happened at Cabul, but, since the policy of retirement from that capital has been definitively fixed on, this concerns us less. As to that retirement, there seems to have been even more confusion in military and political reasoning than in reference to the advance on Candahar. It may or may not be the case that it is our fate to keep a hold on Cabul, but the battle of Kushk-i-Nakhud has not, in a military sense, rendered that hold any more necessary. By setting free a considerable body of troops under Sir F. Roberts, in consequence of the diminished area left to be held in the North-West, it may even be said that it has decidedly facilitated the avenging of that disaster. In such a country as Afghanistan it is impossible to say what will be the result of leaving Abdurrahman to his own devices; but, whatever may be that result, it cannot have much effect on current events in the South. General Roberts is strong enough to break his way through all opposition to his passage, and it is his passage only that we have, *ex hypothesi*, to look to. In other words, the objections to the withdrawal from Cabul now are only the objections to the policy of withdrawal at any time. It is not at all improbable that, as Continental critics are now saying, the probable result of our Afghan war of 1878-1880 will be one of the "Kilkenny-cat" quarrels between the princes of the country which have so often happened before. That may be; but it is not clear how the retention of an army of occupation at Cabul would have facilitated the punishment of Ayoub Khan beyond Candahar. The holding of this opinion implies no approval of the policy of withdrawal as such, but merely denies that the defeat of Kushk-i-Nakhud is an additional reason for opposing that policy. It has always been a misfortune of this Afghan business that military and political reasonings have perpetually been confused. In the present instance the explicit statement of Lord Hartington as to General Stewart's opinion must be allowed no little weight, especially for the reasons already alleged as to the character and objects of General Roberts's force. The future of Afghanistan and of our relations with it is of course a much wider question, and one with which at present we do not deal.

THE RESPITE OF THE INNOCENTS.

THAT Lord Hartington is a merciful man may be thought to be sufficiently evident already to students of his character. At present, however, the quality of mercy seems to have been dashed in him with a considerable infusion of the less amiable quality of obstinacy. The time has come for the massacre of the innocents, and Lord Hartington has apparently sworn by oak and ash, and thorn or by any other formula hereditary among the Cavendishes, that no innocent shall die. This chivalrous resolve does not indeed extend to Mr. Dodson's luckless Bill for the propagation of the smallpox in the parts of Great Britain. The picture of the policeman extracting infants from the arms of their weeping mothers which Mr. Dodson has drawn, is one singularly germane in subject to the massacre, and might have, it would seem, won grace for the bantling fathered by the right hon. gentleman who, in the course of a few weeks, has successively sat for Chester, the Chiltern Hundreds (or rather the Manor of Northstead), and Scarborough. But it has won no favour in the eyes of his colleagues, and has been flung out of the Ministerial chariot as the first and professedly as the only sop to devouring time. Let us charitably hope that a foreknowledge of its fate prompted, and (in consideration of a father's feeling) excused the asperity with which Mr. Dodson about a week ago received the remonstrances of a deputation which, as representing scientific and practical medicine, could hardly have been paralleled in the world for authority. The

Vaccination Bill, then, is gone, but the Ministry, we are told, cling to all the rest of the measures which Mr. Gladstone introduced, save the Bill which the House of Lords slew last week, to the horror and indignation of the sitting member for Galway and the ex-member for Wallingford. There is a whole nursery full of innocents left behind, and Lord Hartington stands in front of the door with his feathers maternally ruffled to protect them against the advancing enemy. Not one of his pretty chickens will he abandon to the destroyers, and he and his colleagues seem to say, "Don't fancy that the Prime Minister's illness makes the least difference; we can defend our young just as well without him as with him."

A glance at the list of the measures which Lord Hartington, a full third of August being gone, still hopes to carry through both Houses, will show that the Government certainly possesses what has been called the better part of discretion. They stick to the Employers' Liability Bill, which has certainly enjoyed the benefit of a considerable amount of discussion, but which is probably destined to receive a good deal more. They are pledged to the Hares and Rabbits, and judging from last Tuesday's debate, and from the conciliatory attitude then displayed by the Home Secretary and by Mr. Bright, this measure, too, will command a good deal of attention. There had already been secret colloguings with the chief Nonconformist leaders about the Burials Bill, and it was obvious that the Lords' amendments in that measure are to be met in the Commons in a manner which did not presage a very speedy passage for it through the Lower House. The Census Bill is a measure which must be got through, and which may or may not be got through without much delay; but the Expiring Laws Continuance Bill, in the face of the recent remarks of the election judges about the Ballot, will hardly win through without a possible struggle and a certain discussion. Under present circumstances the Indian Budget will have to be expounded at great length, and is certain to be discussed at still greater length. The Savings Bank Bill, the Post Office Money Orders Bill, and the Grain Cargoes Bill are innocents which may be said to be in a kind of provisional security only. Lord Hartington is pathetic about their sacrifice, but does not absolutely pledge himself to fight for them to the death. Lastly there is a very formidable list of boroughs on whose moral and electoral condition the judges have reported unfavourably, and whose fate, as far as Commissions upon them go, must be decided upon by the House before the end of the Session. A good deal of fighting over these prostrate and slightly diseased bodies is unavoidable. It is not likely that the House will allow some dozen seats to remain vacant without an effort on the part of the Government Whips—for they are mostly Liberal seats, or seats that have been generally occupied by Liberals—to save them; and if each case is fought separately, neither one night nor two will suffice for appointing the Commissions. Thus it will be seen that Lord Hartington's jealously guarded nursery, especially with its annexe, containing the three respited but dubiously fated children, is sufficiently populous to take a very long time to clear in the ordinary way. If all the measures he has enumerated be fought, even without definite obstruction, and supposing Mr. Parnell's friends do not revenge themselves after the custom of their country (by obstructing Government business because the Government has exposed itself in their cause to a heavy defeat), there is work enough to last not merely to the end of August but to the end of September. It is presumed that the present constitution of Parliament is more favourable to the Government than to the Opposition in regard to the willingness of individual members to stay in town during the early autumn. We are by no means sure that this is actually the case. It was popularly said that at the late general election a hundred lawyers had taken the place of a hundred country gentlemen. Now it does not require much knowledge of the world to be aware that there are not many persons who are keener for their autumn holidays than lawyers. A lawyer who has anything like a practice, and who combines Parliamentary attendance with that practice, must be a person compact of whipcord and whalebone if, by the beginning of the Long Vacation, he is not tolerably "done." Nor is he as a rule so weakminded as to overtask the energies upon which, instead of quiet, dirty acres, he has to rely. It is very much more probable that the opponents of the Government, who are vigorous with their first plunge in the cool Opposition bath, will stick to their work than that its half-hearted supporters will do so, not to mention that the invaluable aid of Sir William Harcourt and Mr. Bright is there to serve as an additional tonic to the Tories. It may be said of Sir William that to hear him is to long to vote in the opposite lobby, and that every speech he makes induces an opponent to give up a day's grouse. As for Mr. Bright, he seems to have mastered in an entirely new sense the celebrated secret of John of Marlborough, how "to teach the doubtful battle how to rage." The difference is that the original John inspired his own side with rage, while his namesake supplies his adversaries with that useful stimulant. If the Home Secretary—which Heaven forefend—were to follow the example of Mr. Gladstone, or if the attractions of salmon-fishing were to prove too much for Mr. Bright, there is no knowing what might happen; but while these two spurs are in active practice on the flanks of the Opposition, we do not think that there is much danger of the Opposition tiring down.

These things being so, it is a question whether Lord Hartington's stoutness was altogether according to the laws of wisdom. A certain hesitation was noticeable in his reply to Mr. Chaplin's remonstrances on the subject of Tuesday night; and it may be that, as the days go on, some prudent sacrifices will yet be made to custom and expediency. We may indeed be pardoned for thinking that the announced determination of the Government has something of the appearance of a little bit of brag. They are desperately afraid that they may be charged with being idle, irresolute, and unpractical, and accordingly they charged themselves at the beginning of the second session with an amount of work which would have been something more than enough for the entire business of the months from February to August. They then by sheer bad management suffered week after week to be expended on the Bradlaugh business, and finally made the accomplishment of their programme impossible by introducing the Compensation for Disturbance Bill at a moment's notice. The time occupied on these two matters, the first of which could by a little statesmanlike management have been settled in a day or two, while the second would never have been brought in at all by any Government of statesmen, would have sufficed to get through half their programme. Having thus made the impossible more impossible still, they turn round and accuse their opponents of obstruction and of wasting time, the charge being loudly echoed by their party organs, including some of which, we must confess, better things might be expected. It is not to be denied that on some few occasions a certain amount, not of obstruction, but of somewhat cavilling opposition, has been visible on the Conservative side. But this is what is always seen after a great party revolution, and what all statesmen are, or ought to be, prepared for. A prudent Minister in such circumstances is extremely careful of his ways, gives as little handle to the malcontents as possible, "goes *piano*," as Lord Chesterfield has it, and, above all, is careful to undertake nothing beyond his strength. The present Ministry have exactly reversed this course. Their own supporters confess that such a tissue of blunders as the leading of the second Session of 1880 was never known, and are fain to comfort themselves with the paradoxical proverb that "a bad beginning makes a good ending." But to complain that political adversaries have made the most of this bad beginning is childish. No one can contend for a moment that the present Opposition have, like the late Opposition, sacrificed the welfare of the nation to the chance of securing party triumphs and the certainty of annoying party foes. Only the dullest and simplest of Radicals can—off the platform—maintain that one single measure opposed this Session, with the exception of the Disturbance Bill, has really affected the national interests. On this one point the difference of opinion was avowed and vital, and the Bill was thrown out because those who threw it out believed, with the vast majority of honest and thinking Englishmen, that the proposal was one fatal to the welfare of society. On every other point the contest has been a fair political game, in which every move allowed by the rules is lawful and honourable. The Government have played hopelessly badly, and have constantly had the worst of the contest. To save their self-love and make a show of strength, they threaten to keep their opponents playing after the usual time has past. If anybody chooses to represent this as a heroic resolve, he may do so; and it may be added, without indecency, that if he can find anybody weak-minded enough to believe him he is welcome to the convert. But it is not a matter to be treated quite so lightly that the exercise of terrorism, whether of a mild or a severe kind, should be constantly approved by the organs of one political party whenever they fail to prevail by argument. The House of Commons shows reluctance to pass a Government measure, and it is told that it is composed of Plutocrats, and had better look out for squalls. It delays over measures brought in with haste and muddled over at leisure by the Government, and is told that it deserves to be "kept in" for its sins. The House of Lords, for exercising its undoubted constitutional rights under circumstances which even grumblers admit to be exceptionally suitable to the exercise of these rights, is threatened with abolition, with curtailment of its privileges, with half-a-dozen other penalties. Now we had always thought that the difference between English representative government and the mob rule of certain other countries was that the exercise of constitutional rights of every individual and class in the State was secured to them by public consent. The hopeless instability of every French Government for a hundred years has been due to this very foible of cutting away the drag directly the drag is put on. As for the House of Lords, there are probably still a majority of reasonable people left who know that if there is one institution in England to which England owes its possession of order and liberty, that institution is the House of Lords. But to do our terrorists justice, they are quite as ready to threaten the one House as the other, and the elected assembly is no more safe from them than the hereditary. "Keeping in" is, it may be at once confessed, a mild form, but not the less a form, of terrorism.

THE ARCHÆOLOGICAL INSTITUTE AT LINCOLN.

FOR the second time, after thirty-two years, the Archæological Institute has met at Lincoln. Though the Society has on several occasions returned to the same county—as in the meetings at Taunton and Northampton—it has only once before, at Canterbury, revisited the same city. No place could better bear a second visit than Lincoln. The result has fully justified the wisdom of the selection. Under the distinguished presidency of Bishop Wordsworth the meeting started well and, notwithstanding the unfavourable weather and the cloud thrown over its proceedings

by the almost sudden death of Mrs. Blakesley, the wife of the Dean of Lincoln, did much good work. Many interesting objects were visited; several capital papers were read; and obscure points in history and architecture were discussed and elucidated. The key-note of the meeting was struck by the Bishop of Lincoln in his very remarkable opening address. Characterized as it was by varied learning, high culture, refinement of thought, and eloquence of language, the address will, we hope, take a permanent place in archæological literature. The sermon preached before the Institute in the Cathedral was equally appropriate. The charge used to be brought against the Institute of neglecting the place of their meetings for other distant objects of attraction. With years comes wisdom, and the Institute has, to some extent, learnt a better way, though the time devoted to Lincoln was far from being sufficient. A day and a half, and that chiefly occupied with reading and hearing papers, was hardly adequate for a city so full of historical and archæological interest. One or two of the most interesting objects were unaccountably passed over. Although the curious specimen of twelfth-century domestic work, popularly known as "John of Gaunt's stables," was visited, we believe that neither of the two "Jews' houses" received the special notice deserved by almost the earliest examples of domestic architecture in England. Neither of them entered into the official programme, and though they were doubtless visited by some who strolled guideless through the city, more are likely to have missed them. As to the house of Belaset of Wallingford—interesting particulars of the marriage contract of its owner's fair daughter Judith to the young "Aaron, son of Benjamin *fil* Josce," A.D. 1271, of the mother's gift of a copy of the Hebrew Scriptures written on calfskin to the boy bridegroom, his father undertaking the charge of the precious roll, "to be employed in the instruction of the children," until they were of age for the consummation of the marriage, and of the wedding-feast given by Belaset in the house still standing on the Steep Hill, were given in Mr. M. D. Davis's very remarkable paper, dug out of the Hebrew documents in the Public Record Office, read on Tuesday evening. The second is the less perfect but hardly less curious house of "Aaron le Riche," the famous money-lender, who had the greater part of the nobles of England and not a few of the clergy also, on his books as debtors—the undoubted prototype of Sir Walter Scott's "Isaac of York"—and whose pecuniary transactions received illustration in the same paper. Nor could we find that the beautiful Edwardian house, equally remarkable for its date and style, on the south side of the Vicar's Court, was formally visited or described. A more charming and instructive specimen of early fourteenth-century domestic architecture does not exist in England, and it should certainly have been a special object of examination. So should the beautiful sideboard recess of the same date, and of even more exquisite design, in the so-called "Priory"—a foolish modern name—at the N.E. angle of the crenellated Close wall. All these were duly mentioned in the "General Notes" issued by the Institute for the use of the members, but somehow they slipped out of the scheme, and in other matters the programme was not always rigorously adhered to. On the whole, however, Mr. Albert Hartshorne's arrangements were excellent. The excursions especially were well planned, both as regards the selection of the places visited and the proportionate time devoted to their examination.

Lincolnshire is singularly deficient in monastic remains. Rich as it once was in conventual foundations, almost all of these have entirely passed away, and a few fragments of walls or some grassy mounds alone indicate their site. Croyland, one of the few exceptions, lies on the southern limit of the county quite out of reach of a Lincoln meeting. The Cistercian Abbey of Louth Park, of which the unearthing was commenced some years since by the proprietor, Mr. W. Allison, with such rich results that we wonder the excavations have not been continued, might have claimed a visit, but it is inconveniently remote, and it was impossible to work it in. Few also are the castles and old houses. The castles of Lincoln, Sleaford, Somerton, and Tattershall exhaust the former, while, after the priceless remains of Lincoln itself, the representatives of early domestic architecture are few and widely scattered. The Norman house at Boothby Pagnel, and the fine fifteenth-century manorhouse at Irnham would have rewarded the trouble of visiting them. So would the stately Jacobean mansion of Doddington, which was perhaps both too near and too far off to be conveniently included. The one mediæval house visited was the very interesting half-timbered, or "post and pan" mansion of the Burghs at Gainsborough, now under careful restoration by its owner Sir Hickman Bacon, under the able direction of Mr. Somers Clarke. The work, so far as it has been carried out, has been well done, and we are thankful to be able to record the rescue of so remarkable a specimen of fifteenth-century architecture from a condition of almost unparalleled degradation. It would be well if such instances were more common.

But if Lincolnshire does not exhibit many abbeys or castles or halls, it abounds in fine and interesting churches, many of them of very unusual size and magnificence. To these therefore the attention of the Institute was chiefly directed. The survey began after the opening meeting on Tuesday with visits to the very curious churches of St. Mary le Wigford and St. Peter at Gowts in the lower city of Lincoln. The early English interior of the former church is one of singular beauty and has been well restored; the new aisle and its arcade being very wisely in a different style from the old one, so that no confusion between old work and new can arise. But the chief interest in this church as in its neighbour centres in the western towers—tall, slender, unbuttressed, tapering as they rise, rude but undoubted copies of the Lombardic campaniles, invaluable links in the chain which connects our native architecture with that of Rome. These towers have been attributed by Mr. E. A. Freeman on the authority of Domesday, to Colswegen the Dane, shortly after the Conquest. But, however it may be with St. Peter at Gowts, an inscription on the pediment of a Roman sepulchral slab, built into the west wall of the tower, which, after long baffling all attempts to read it, has lately been deciphered by Professor Müllenhof—who with the keen sight of a true palæographer was guided by an indistinct "labarum" at the head of the lowest line to the curious fact that the inscription is to be read from the bottom upwards—proves that St. Mary's was built and dedicated by one Eirtig, presumably from his name an Anglo-Saxon.

The first church visited out of Lincoln was, as its rank and historic reputation deserved, the grand historic minster of St. Mary's Stow, fraught with memories of St. Etheldreda and her much forgiving husband Egfrid, of Leofric and Godiva, of Bishop Eadnoth of Dorchester, and Remigius and St. Hugh of Lincoln. Although the idea that any part of Egfrid's church still remains in the present fabric, so fondly cherished by those to whom the church is dear, was pronounced baseless by Mr. Parker and other well qualified judges, there is no doubt that the piers and arches of the crossing and portions of the transepts are pre-Norman, the work of Eadnoth, c. A.D. 1040, while the nave is as certainly the work of Remigius, and the vaulted chancel that of Alexander of Lincoln. There is much, however, to excite curiosity in the church, and we think its architectural history has not yet been fully made out.

South Lincolnshire and the adjacent district of Nottinghamshire are famous for the grandeur of their parish churches, and the elaborate character of some of their internal decorations. Such a series of magnificent edifices as those visited on Friday—Grantham, Sleaford, Heckington, Boston, and Tattershall—could be matched in few counties, surpassed in none. The expedition went first to St. Wolfrans, Grantham, with its lofty and admirably proportioned Early English tower and spire, regarded by the late Sir Gilbert Scott as second only to Salisbury among English steeples—we ourselves give a higher place to that of Louth—reaching an altitude of 274 feet, equal if not superior to that of Chichester with its vast interior, exceeding in area the Cathedrals of Carlisle and Oxford, and Bath Abbey Church. In St. Wolfrans parts of the greatest diversity of date and architectural character, beginning with late Norman and ending with Bishop Fox's "Corpus Christiaisle" in Late Perpendicular, are fused together into an harmonious whole, and it only wants a clerestory to render its interior one of the grandest in England. The excursion then went to St. Denis, Sleaford, a cruciform church, with a western tower and very early and somewhat dwartish broach spire, and quite unsurpassed for the beauty and variety of its window-tracery of the curvilinear Decorated type, and the excellence of its mouldings. The east window of the south transept was ranked by the late Mr. Edmund Sharpe as the fourth window in the Decorated style in England, surpassed only by the east windows of Carlisle, Selby, and of the next church visited, that of Heckington. The roodscreen and loft was deemed by Pugin one of the most perfect in England, and is remarkable for being approached by a double stair. The curious mediæval inscriptions commemorating the builders of various parts of the edifice, and the noble series of Carr monuments contribute to make Sleaford one of the most interesting, as it is one of the most beautiful, of Lincolnshire churches. In symmetry, however, and harmony of proportions Sleaford must yield to St. Andrew's, Heckington, which may be regarded as the most perfect English example of a parish church in the curvilinear Decorated style, while Sleaford has nothing to offer to rival the magnificent Easter sepulchre, sedilia, and other sculptured works which ornament the interior of the chancel of this justly celebrated church. Three successive excursions enabled the Institute to compare the three most remarkable examples of mediæval chancel arrangements to be found in England—those namely of Navenby, Heckington, and Hawton. In each of these the whole work is of one date, and forms an integral part of the chancel, while all three are probably the conception of the same designer. Rickman many years since was the first to call attention to these examples of the union of mediæval sculpture and architecture, as remarkable for their excellence both in design and execution, as for completeness of their arrangement, and for the illustration they afford of the præ-reformation ritual of the English Church. These Easter sepulchres were commonly frames of timber, set up year by year, and notices of them continually occur in mediæval churchwardens' accounts. In not a few instances, however, as here and in the less profusely sculptured, but even more chastely beautiful, Easter sepulchre in the cathedral of Lincoln, they were permanent erections of stone, of more or less elaborateness of workmanship. Of these that of Navenby, though a fine composition, holds the lowest place, and that of Hawton the highest; Heckington coming between the two. At Hawton not only is the idea more completely carried out, the Ascension being represented at the apex in addition to the usual sculptures of our Lord appearing to Mary Magdalene below and the sleeping soldiers on the base of the structure; but the whole, including the richly canopied founder's tomb and sacristy door, with which in each instance the sepulchre is associated, forms a more complete and harmonious composition than in the sister churches, while from the comparative smallness of the church, these works, together with the equally rich sedilia and piscina on the

South side, appear more, as an essential part of the building and less as mere ornamental accessories. At Heckington, as at Hawton and in the other instances named, the sculpture both of figures and of foliage is of surpassing excellence. It may, indeed, be questioned whether the delicacy of its elaboration is not almost excessive, and whether a plainer design would not have been more effective. The vast and stately church of Boston, the third in area of the purely parish churches of the kingdom, coming only a little after the huge edifices of St. Nicholas, Yarmouth, and St. Michael's, Coventry, with its glorious tower or "Stump" mounting at one spring to a height of 250 feet, and then crowned with a light octagonal lantern of open tracery, rising 30 feet higher, forming the loftiest ancient steeple in England, is world famous. The warning given in these columns some years since against injuring the impression made by so fine an exterior by entering the church was necessarily unheeded, but its meaning was at once evident. The crushing weight of the low sham-vaulted ceilings of carpentry and plaster mars the effect of the lofty nave arcades, the unbroken line of clerestory windows, the lengthened and well-proportioned chancel with its long line of richly canopied stalls, and the truly glorious belfry arch and western window, and ruins what would otherwise be an almost unrivalled interior. Can it not be demonstrated that the ceiling is rotten and needs reconstruction? Mr. Gilbert Scott has been already employed upon this church, and the task of designing an appropriate roof might be safely left in his hands. The churches hitherto seen on this expedition had been chiefly of the earlier styles. The last visited, the once collegiate church of Tattershall, founded in 1439, by Ralph Lord Cromwell, Lord High Treasurer to Henry VI., and completed after his death, in 1455, by his executor, Bishop Waynflete of Winchester, who has affixed his arms on the north porch, was a characteristic specimen of Perpendicular, displaying all its merits and some of its faults. Robbed by its noble patron in 1754 of its rich stained glass windows, the ill-arranged fragments of which are to be seen in St. Martin's Church, Stamford, and left for years to the mercy of the elements, by which the stalls and other rich woodwork were entirely destroyed, its magnificent monumental brasses broken and purloined, few churches have suffered more from gross neglect. Its present condition is very different. But, from being far too large for the requirements of an agricultural parish, it is only partially used, and its general aspect is somewhat dreary. The very perfect ancient rood-screen and loft deserve careful attention. The castle, under the shadow of which the church stands, built in 1440 by the same Lord Cromwell, is a noble specimen of a quadrangular brick tower, reminding one of Layer Marney, but less picturesque. The brick groining of the corridors, and the magnificent fireplaces, with their crowd of armorial bearings, are admirable in their way; but the castle, being all of one date and that a late one, wants the interest of earlier and more varied edifices. Newark Church, one of the same class of immense and magnificent parish churches to which Grantham and Boston belong, and exceeding them both in loftiness and a sense of space, as well as in the richness of its mediæval screen work, choir furniture, and monumental chantries, was seen on Saturday. The architectural history was very lucidly treated of by Mr. J. T. Micklethwaite, who here illustrated from actual example the principles laid down in his excellent and instructive paper on "The Growth of a Parish Church"—a subject too much neglected—previously read in the Architectural Section on the same day. He traced the development of the edifice from the Transition Norman cruciform church, of which little more than the piers of the crossing remain, by the gradual steps of the erection of the Early English tower and its later broach spire—not very satisfactory in outline, and rather overloaded with spire lights—the Decorated south aisle, the Perpendicular north aisle and chancel, to its completion by the erection of the transepts in the sixteenth century. Few churches show a more valuable succession of excellent and accurately dated work. Mr. Micklethwaite's lecture was, we think, the most valuable, certainly one of the most interesting delivered during the Congress. Hawton Church, to which the members splashed through the waters of the overflowing Trent, under the guidance of its recent restorer, Mr. James Fowler of Louth, is a comparatively small and plain edifice, only remarkable for its lovely Decorated chancel and the Easter sepulchre and sedilia of which we have already spoken. The effect of the short Early English nave has been ruined by a tall, bare, late Perpendicular clerestory. The restoration has been a careful, and on the whole, commendable one. But we must once more raise our protest against the process of scarification of the interior walls to which it has been subjected. We had hoped that this bad practice, greatly in vogue a few years since—of which Heckington with its darkly pointed joints affords a lamentable example—had been exploded.

We can barely enumerate the churches visited on the last day's excursion—Navenby, which has been already referred to; Welbourn, the one unrestored church inspected, with its queer bulbous spire and rich Decorated porch and gabled buttresses; Leadenham and Brant Broughton, whose graceful spires oddly contrast with that of Welbourn, while the pewed and whitewashed interior and mean fittings of Leadenham set off the exquisite arrangements and decorations, which render a visit to Brant Broughton delightful. The expedition ended with the curious Edwardian castle of Somerton, built by the proud patriarch of Jerusalem, Antony Bek, Bishop of Durham, which became, after its prudent cession to his royal master, the prison of King John of France, after his capture on the field of Poictiers in 1356.

Lincoln and Southwell Minsters were of course the subjects of lectures and addresses, those on the former being delivered by Precentor Venables and Mr. J. H. Parker, that on the latter by Mr. Ewan Christian. Precentor Venables was fortunate enough to be able to illustrate his lecture by the very ground plan drawn up for a similar purpose by Professor Willis in 1848, and kindly lent by his nephew, Mr. J. Willis Clark; and by magnificent elevations and sections prepared by the late Mr. Edmund Sharpe, also lent by his son. The history of the cathedral received additional illustration in two learned and graceful papers by Canon Wickenden, one on the Muniments of the Chapter, to the cataloguing and arranging of which he has for some years past generously devoted his time, and the other on the magnificent stalls and misereres of the choir. Both we hope to see in print.

Of the other papers read, those by Canon Perry on "the Episcopal Visitation of Lincoln Cathedral"; by Mr. Peacock on the storming of the Castle and Close by the Parliamentary forces in 1644, and the subsequent fortunes of the city; by the Rev. F. Spurrell on the death of King John at Newark Castle, which he ascribed, on the testimony of contemporary authorities, neither to the venom of a toad nor to poisoned pears, but to copious draughts of new cider; and one by Mr. Thomas North on the "Bells of Lincolnshire," deserve appreciative mention. That by Mr. G. T. Clark on "Post Roman Earthworks," was full and clear, although rather technical. Finally the question of the restoration of the west front of St. Albans was brought before the meeting by Canon Owen Davys, in a paper copiously illustrated with drawings, showing the front as it is, and as respectively proposed by the rival renovators, Mr. G. O. Scott and Sir Edmund Beckett. The unprofessional design is the better; but we do not commit ourselves to either.

ART IN PARLIAMENT.

It is easy and common for people to complain that we do not bestow adequate attention on the public aspects of art. Yet some of us are old enough to remember a time when no attention at all was paid to it except by private persons. The British Museum was not originated in any public ordinance. The National Gallery was long a wholly private concern. Instead of thirty or forty exhibitions of pictures, we had not three or four in the memory of the present generation. That Parliament should be concerned at all about sales of books and prints and butterflies would have been incredible not long ago, yet we have now an annual, if brief, debate on such subjects; and if there was one act of the late Ministry which all parties agreed to approve, it was the purchase of a celebrated collection. In the same period the face of London, not to say of England, has been changed. The squalid little brick houses of a hundred years ago are not more unfashionable now than the painted plaster-work of Nash and the Regency. We may not be able to admire the vagaries of the so-called "Queen Anne" style, yet we can all see how much better it is than the worse than no style in which all our new streets used to be built. When Thackeray designed his little house of Palace Green, in avowed imitation of Kensington Palace opposite, he could hardly have expected that his idea would be so warmly taken up before twenty years were over. The "Thackeray style," by the way, would be a better name for the modern imitators of Jones and Wren than that which they have adopted. But we are certainly not yet an architectural nation; and the change in public feeling is far more clearly seen in the present position of painting and the kindred arts. The Academy has overflowed into the Grosvenor, yet there is no complaint of a want of attendance at either annual exhibition. On the contrary, the love of art, in this phase, becomes greater day by day, and more and more people of all classes are learning to judge for themselves, and to value good work, harmonious colour, tasteful design, when they see it. They no longer in the National Gallery crowd round the "Blind Beggar" or the Ettys. Even Murillo and Correggio have lost half their charm for sightseers who require careful work, thought, finish, colour, correct drawing—all of them things nobody understood or cared about, except as figures of speech, when William IV. was king. The spread of high art, real or imaginary, into our homes is one of the most ordinary themes of contemporary satire. Thirty years ago a few canons of "good taste" were implicitly followed. Now we know better. Blue, for example, was forbidden. Now, all is blue. "Peacock" had not been discovered. A good copy of Chippendale might have been bought for a sovereign. The Monarch of the Glen was on every hearthrug, and every carpet emulated a garden flower-bed. We are perhaps quite as extravagant in an opposite direction, as some critic of the future will probably discover, but if so our company is larger. There are fewer and fewer every year who do not care at all, and of the many who have a taste, more and more can found it on some reason, and at least think they like a thing because it is good; not so much because they know what they like, but because they know why they like it.

On Monday night the attention of the House of Commons was directed to the cry which is coming up from the country for a supply of objects of art for local museums. In the larger country towns it has suddenly been found necessary to supply workmen

in all branches of art with adequate instruction, and, as a consequence, we are asked for specimens to satisfy the demand thus created. The country folk seem to think that the British Museum should supply a part of this want. It is credited with the possession of large quantities of duplicates. As Mr. Rylands observed, "in the case of duplicate specimens, great good might be done by their distribution among the large towns where museums existed." Mr. Beresford Hope, in reply on behalf of the trustees, pointed out the true state of the question, and probably insisted much more than the *Times* reported him as having done that the British Museum is a central and universal storehouse, to which specialists can always refer with confidence; and also that the very existence of the duplicates, of which so much has been said, may be doubted. We hear that, as a familiar illustration of what did and what did not constitute a duplicate, the House was referred to the well-known variant in the frontispiece of the first edition of the *Leviathan*, in one of which the symbolical figure of the giant despot has the face of Charles I. and in the other of Cromwell. With respect to the idea of spreading duplicates over the country, it is, no doubt, as was observed, of a very attractive nature, and, speaking in the abstract, every one would be glad that the treasures possessed by the great central institution at Bloomsbury should be made as widely useful to the country as possible. But, as a practical matter, it is assuredly true "that the collective wisdom of mankind would conclude that it is more convenient that the many Mahomets should go to the various mountains than that the various mountains should go to the many Mahomets." The British Museum contains many such mountains. The Egyptian collection, for example, or the Ninevite, or the Elgin marbles, or the prints and drawings, or the manuscripts—all these are mountains which it would be in the highest degree imprudent to scatter or separate, even for a short period. The country student who has by the help of his private collection, or that of the local museum, worked up a subject to a certain point, must be able to look forward with certainty to finding what will complete his labours in some one place, and what better place can there be than a centre of population like London? The number of such serious students who are permanently banished from London, must be very small in comparison with those who reside within reach of the great national collections. It would be in the highest degree inconvenient if, by loans or otherwise, the certainty of finding what we want when we want it should be taken away. As Sir John Lubbock remarked, "persons would be very much disappointed if, when they had come from a distance to see particular objects, they found those very things were away on loan." We have all experienced, even in the case of books which are not out of print, the difficulty of obtaining what we want in a library where loans are permitted.

With regard to duplicates, two questions arose in the course of the short debate. Presuming that duplicates exist, a separate staff would be required for their selection and distribution. But it has been asserted in well-informed quarters that very few such duplicates do exist. It often turns out that books or prints which for years have been thought to be duplicates, have in reality been totally different. Some years ago a party of enthusiastic bibliographers obtained the loan from Windsor Castle of what had always been considered the duplicate of an early Psalter in the British Museum. When the volumes were compared, and a third with them, it was found that all three, although printed at the same date, and at the same place, and by the same printers, yet differed from each other in many important particulars. The only real duplicates are perhaps two copies of the same edition of a modern book; but there may be, and in many cases there is, a necessity for keeping both. Besides, even among well printed books slight differences do occur. The first copies of a recent theological work contain a dedication in which two great "living" divines are addressed as "lying." In fact, in a world in which no two blades of grass are exactly alike, there are many similar examples. An eminent collector was lately heard to say that no two impressions of an etching could be considered duplicate. And in one large collection it was recently discovered that some thirty or forty prints which had been put aside many years ago as duplicates, were, in reality, different states. The authorities of one of the University museums recently sold their so-called duplicates, and were considerably mortified to discover, when it was too late, that they had parted, in many cases, with copies and early states, and diminished the value to the student of the prints they retained. Every manuscript is unique, and no collection, however large, can be said to contain duplicates in this branch. It would be easy to enlarge indefinitely upon the danger of parting with any but worn-out or inferior objects, and it is obvious that such specimens will not fetch a price sufficient to pay for the trouble of selecting and cataloguing. It is no secret that the sale of duplicate prints from the collection in the British Museum which took place last winter, failed to satisfy the expectation of the trustees. We must be poverty-stricken indeed if we cannot afford so small a sum as 3,000*l.* for such a collection as that of Mr. Crace, without endeavouring to make it up with a paltry 600*l.* or 700*l.*, derived from the very questionable expedient of a sale of duplicates.

South Kensington divided with the British Museum on Tuesday night the attention of speakers. There was the usual amount of grumbling at the way in which the accounts of that institution are presented. We have adverted so often in past years to this subject that it is only necessary here to express our regret that an improvement has not been made. But at South Kensington the duplicate question arises with greater force than in the British Museum. A list of the duplicates suitable for circulation on loan was printed in 1872, and can, as Mr. Mundella observed, be readily made complete to the present time. Duplicates at South Kensington really mean things between which a certain similarity of manufacture exists, as, for example, in pottery or in metal work, or in the case of pictures by the same artist. But of duplicates, in the strict sense of the word—that sense in which it must be applied to the British Museum—there probably exist as few at South Kensington as elsewhere. Referring to the National Gallery and the National Portrait Gallery, Lord Frederick Cavendish said he had consulted the trustees, and found that there were no duplicates in either collection, except one among the portraits; for copies of a picture are on a very different footing. Yet at the present day there are so many means of obtaining casts and reproductions, sufficiently faithful to be of use to the student, that it is much to be hoped that Mr. Beresford Hope's suggestion may be taken up by the Treasury, and a small sum granted "which would make it possible to reproduce and scatter broadcast, through the local institutions, copies of originals which should be kept in some separate place."

ALDINES AND ELZEVIRS.

One of the earliest symptoms of bibliomania is a passion for Aldines and Elzevirs. The young patient generally labours under the delusion that all books from the great Venice and Leyden presses are of equal value. Novels encourage this delusion; they always represent learned professors as "rich in Aldines and Elzevirs"; and we recently read a romance in which one of the characters possessed an Elzevir Theocritus. This treasure would indeed have been of great price, the black tulip or blue rose of bibliography, for an Elzevir Theocritus is unknown to Brunet, to Pieters, and to M. Willems, the last writer on the great Dutch publishers. Misled by novels, then, and by vague tradition, the bibliophile, in the first stages of the complaint, haunts bookstalls, and thinks himself wonderfully fortunate. Elzevirs more or less grubby, and with pages more or less cut to the quick, are to be found in hundreds, and at very moderate prices. The beginner buys and buys, thinks himself a perfect "snuffy Davy" for luck, and never guesses that he is accumulating trash, and laying in stores of lively book-worms which will devour his treasures. He knows nothing, as yet, of right editions. An Elzevir Cæsar is an Elzevir Cæsar to him. Now the genuine Cæsar of 1635 is, in M. Willems's opinion, the gem of all the duodecimo collections. By the way, even the neophyte is generally knowing enough to collect none but duodecimo Elzevirs, though the larger *formats*, like the Tacitus with variorum notes, the Apollonius Rhodius, and dozens more, are quite as beautiful as, and infinitely more legible than the "small rare volumes dark with tarnished gold." To return to the Cæsar of 1635. With the Pliny of the same date, the Virgil of 1636 (of which Charles Nodier could never procure a satisfactory copy), and the undated *Imitation*, the Cæsar is the pride of the Elzevir collections. The type, the ornaments, the exquisite printing, the paper, and even the correctness of the text, leave nothing to be desired. But there are two other editions, also dated 1635, in which pages 149, 335, and 475 are correctly printed, whereas in the true edition they are marked 153, 345, and 375. These two editions are worth little, especially the second of them, while the right Cæsar, with the wrong pages, costs some twenty pounds at auctions. This is only one example of the niceties of the taste for Elzevirs. There can scarcely be a prettier little book than "the pocket edition of Rabelais" of 1675. This edition is a reimpression, line for line, of that of 1663, yet it has scarcely any value, while the earlier book costs sums quite out of the reach of the modest beginner. Every one of these editions seems incorrect to modern scholarship; but the first was eagerly welcomed by Guy Patin when it was new, and cost "four livres, ten sous." The fact is that the value of Elzevirs depends partly on fashions (some worthless books bring hundreds of pounds), partly on condition, breadth of margin, and the presence or absence of certain marks which can only be learned at some expense of time, money, and research. Of forged or false Elzevirs more than one hundred and fifty are known to experts. Thus the beginner is likely to be puffed up with pride when he has secured *Les Mémoires de Philippe de Commines*, A Leyde, chez les Elzeviers, 1649; especially if his prize prove a little taller and wider than the other copies with which he compares it. Examples, as the manuals will tell him, are very dear. M. de Montesson's copy cost about 50*l.*, and 20*l.* is a not uncommon price. Alas! the right edition is of 1648; and that of 1649, in spite of the title-page and the figure of the old hermit, is a forgery, printed on larger paper, and probably published at Rouen. Let the Scotch Presbyterian also beware of spurious imitations. Who that has learned the *Shorter Catechism* in his youth, who that has blundered over "justification, sanctification, and adoption," would not willingly possess an Elzevir edition of his old enemy? Such a book seems to exist, *The Confession of Faith, and the Larger and Shorter Catechisme*, &c., Amsterdam, printed by Luice Elsever, 1649. Unluckily, the book, which was exhibited at South Kensington in 1877 with the Caxton collection, is a forgery. The late Mr. Laing sent a facsimile of the title-page to M. Willems, who at once saw that the types were English in

character, and utterly unlike anything ever used by the Elzevirs. Again, there is not in the book a single *fleuron* or other ornament, such as the Elzevirs always used, and, lastly, the *Shorter Catechism* is not mentioned in any of the Elzevirs' own catalogues of their publications. The object of the forgery remains a mystery. To close this chapter of forgeries, it may be mentioned that false Elzevirs bear dates as late as 1770, while the last of the great and accomplished printers of the family died in 1680, and the last who professed a humbler sort of art, in 1712.

The hunter after Aldines is likely to fall into the same snares as the inexperienced lover of Elzevirs. Only certain editions are of value, and the worth of these depends greatly on their condition and even on their binding. There is a tendency, a natural tendency as we think, to prefer the books published by the great founder of the Aldine house, between 1494 and 1514. Aldines do not retain their high place in the estimation of collectors so firmly as the books of the Elzevirs. The latter published early and beautiful editions of the contemporary French classics, while the Aldines chiefly printed Latin and Greek books, and works of erudition. Neither classics nor the superseded philology of the sixteenth century are now so much valued as they once were. The classics are, we say it with pain, almost a drug in the market. New frivolities have usurped their place. People look for original editions of French and English poets, or for early woodcuts, or for the oddities of Restif de la Brétonne, or for the vignettes of Cochin, and Eisen, and the other French "little masters." The Greek and Latin classics are almost as much neglected as works of heresy, like those of Bruno and Vanini, and the little tome on the "Pre-Adamites," which the Elzevirs published in an incautious moment. We can "see" these heresies now, as the Americans say, and "go a thousand dollars more," in the same direction. New editions of the classics, too, have made all but the masterpieces of Aldus, Musurus of Crete, Zacharias Calliergus, and other great scholars, seem superfluous. And, in the search for Aldines, as of Elzevirs, the bibliophile must beware of the piratical counterfeits printed at Lyons. Aldus himself complained bitterly of the Lyons pirates. "The paper of these books is second-rate, and even smells badly." We can testify, from a Lyons counterfeit of the Aldine Catullus of 1502, which lies before us, that the paper is second-rate. The evil odour, however, has disappeared in the course of nearly four hundred years. Another way of detecting forgeries is to note whether the consonants are attached to the vowels, as in writing, or whether they stand apart. In the former case the book is probably a genuine Aldine, in the latter it is a Lyons forgery. There are various other distinguishing marks; but we have probably said enough to teach the young bibliophile that all old books printed in italics are not Aldines, and even that many apparently authentic Aldines are forgeries almost worthless.

To take an intelligent interest in the productions of the two famous houses, the Venetian and the Dutch, one ought to have some notion of the characters and purposes of Aldus, and of the Elzevirs. A catalogue of a private collection, just published by Mr. Toovey, may serve as a text for a few remarks on the Manutii. The collection "owes its existence to a well-known distinguished collector, who, true to the motto of the family, for half a century lost no opportunity of selecting under the most favourable circumstances the choicest copies of the several works as they appeared at the dispersion of the libraries formed by Renouard, Sir Mark Sykes, Heber," and many others. We do not know what family rejoices in the admirable motto which bids its scions lose no opportunity of collecting Aldines. But the amateur whose catalogue is in our hands had books in the original bindings of Aldus, De Thou, D'Hoym, and the other great old fanciers. It is scarcely necessary to say that a binding of De Thou's, or D'Hoym's, or Grolier's (none of whom, we must once more say, to correct a popular error, were bookbinders), adds indefinitely to the market price of a volume. Opening Mr. Toovey's catalogue at random, we light on the *Anthologia Græca* of 1503. Aldus followed here the text of Alopa's Florentine edition of 1494, but added some epigrams previously unpublished. M. Firmin Didot possessed an autograph letter in which Scipio Carteromachos congratulated Aldus on this casket of jewels, "containing the flower and choice of the most gracious poesy." A more interesting item is the Aristophanes of 1498, containing but nine plays, all that then had been discovered. Aldus dedicated his book with enthusiasm to Daniel Clary, then Greek professor "in opulent Ragusa." In every line of Aldus's letter there burns that noble love of classic literature which was the sole motive of his unwearying industry. Musurus of Crete adds a letter in which he bids "Philhellenes" pay Aldus due honour. Aldus, indeed, combined the rare characters of an enthusiastic grammarian and a disinterested publisher. His editions, even now, are reckoned with manuscripts among the critical apparatus of scholars.

The Elzevirs were neither nobly born (as were the Manutii if they were descended from the Mannucci of Florence) nor of a noble temper. The family seems to have had no connexion with Spain, as has sometimes been asserted. Louis Elzevir, the founder of the family, was a bookbinder by trade. About the end of 1580 he settled in Leyden, and obtained leave to build a shop in the grounds of the University. His central position gave him great advantages; he started as a bookseller, and published his first volume in 1583. By an interesting coincidence the latest Aldine in Mr. Toovey's catalogue is dated 1583, and thus the Elzevir obscurely arose just when the house of Aldus was declining. The Elzevirs made their great stroke for fame and fortune, when they began to publish cheap and neat editions of the classics in duodecimo. Large *formats*, the quarto and folio, went out of fashion. The Elzevirs had anticipated the cheap and handy volumes which M. Charpentier introduced to France, and from which Mr. Matthew Arnold hopes for the regeneration of British literature and the end of trouble about copyright. The duodecimos first came out in 1629, and were welcomed by the learned. But many shortsighted students, with whom most modern readers will sympathize, condemned the minute type, which demands a weary service from the eyes. Perhaps the Elzevir types were the beginning of German shortsightedness. De Put wrote to Heinsius, that the printers "cared for nothing but money," and the father of Madame Dacier was of much the same opinion. Posterity has judged the Elzevirs more leniently. But it is unhappily beyond doubt that Bonaventure and Abraham Elzevir were even more mean and cunning than the booksellers whom Drayton spurned with poetic contempt. They were as "crafty" as Scott's Constable. Heinsius, too, the scholar who supplied what Aldus had and the Elzevirs lacked, acquaintance with letters, was an ungenerous and malicious man. Thus the Dutch printers have none of the charms which his untiring enthusiasm lends to the memory of Aldus Manutius. They printed, pilfered, pirated, though certain of their victims took the piracy for a compliment:—

> Ecquidnam video? O Dei Deæque
> Nostros scilicet Elzevirianis
> Excusos video typis libellos.
> O typos nitidos et elegantes!

So sung Ménage when Daniel Elzevir printed his poems. The French volumes of the Elzevir were as convenient as the Tauchnitz editions of English novels. The chief printer of these pretty books was Daniel, at Leyden from 1652 to 1655, at Amsterdam from 1655 to 1680. His character in part redeemed that of the crafty Abraham and the dodgy Bonaventure. On his death the better part of the business ended; but an Abraham, great-great-grandson of the founder of the house, lived and printed horribly at Leyden till 1712. His principal business was the publishing of college *theses*, and even these he turned out most execrably. The Elzevir types long survived the last printers of the family, but were destroyed by a publisher who was infatuated about the work of a German founder. *Sic transit gloria.*

COOKERY BOOKS.

OF making many cookery books there is no end. They are commonly held in small repute, and it is very generally said of them with justice that they teach nothing except to those who have little to learn, and that the common result of their study by a matron and her cook is the production of messes far inferior to good roast or boiled, and remarkable for nothing but a happy mixture of greasiness and acidity. Nevertheless a great number of them are written, and the old standard works are often republished. Works on cookery and housekeeping have been published during the present season, and Messrs. Houlston and Sons have brought out a new edition of Dr. Kitchiner's famous *Cook's Oracle*, which was first given to the world in what gastronomes are apt to look upon as the dark ages of British cookery. The reappearance of this old friend will be welcomed by many, for though the majority of the Doctor's recipes have now little value, having been supplanted by better ones, and though some of his sauces must needs make the learned shudder, useful hints may still be found in his book, and his preface must always be amusing reading. The Doctor, as every one knows, was not merely the frigid impersonal instructor, coldly laying down rules for the preparation of dishes, but was rather the kindly and genial adviser, telling his readers, with a sympathetic familiarity which never comes amiss, how he had worked for their welfare, and giving both to masters and servants the benefit of his experience and knowledge in the shape of elaborate admonitions and "friendly advice." His work has that charm which always belongs to the writings of a true enthusiast; and his enthusiasm must undoubtedly have sprung from really deep conviction, or he would not have dared to give it such fervent expression, for at the time when he wrote the art which he adored was regarded by the great majority of his fellow-countrymen with brutal and ignorant contempt. He was himself not without strong prejudices and quaint fancies, but in the main there can be no doubt that he was guided by a perception very rare in his day of what constituted good dinners, and by a desire to aid and improve his fellow-creatures, then living for the most part in outer darkness. Of his sincerity in the cause for which he laboured there can be no doubt, and it is impossible to read his preface and introductory chapters without giving him implicit credence when he says that every recipe he gives has been tested in his own kitchen, and that he has submitted "to a labour no preceding Cookery-Book-maker has perhaps ever attempted to encounter, having *eaten* each receipt before he set it down in his book."

Owing to the resolute spirit which made him thus imperil his digestion, and owing also, no doubt, to the large assistance he received from the lady whose name has quite recently been disclosed, the Doctor's book was certainly—for the time when it appeared—a very good one, and as well calculated as any work could be to shake the obstinate belief of Englishmen in the cardinal virtues of a monotonous diet. He indeed hoped to do even

more than this, for he fondly thought that he had written so clearly and fully as to make it possible for any one who studied his book to cook well; and he stated, in a well-known passage, that "the most inexperienced student in the occult Art of Cookery" might work from his recipes "with the utmost facility." That he greatly overestimated what he had done, and totally failed to produce any such admirable result as he hoped for, need hardly be said. There is not very much danger in asserting that no one has ever become a good, or even a fairly good, cook merely from reading the *Cook's Oracle*. The excellent Doctor's fondest hope has not been in any degree realized, and his confident expression only serves to show how little the most earnest men can judge the value of their own achievements. If, however, he could be resuscitated, he might be reconciled to his failure by observing that, if he was no more successful than his predecessors had been, the many who have written since his day have been no more able than he was to teach people how to cook by means of written instructions. There were a large number of cookery books in existence at the time of the publication of the *Cook's Oracle*. Dr. Kitchiner says that he has gone through the "Herculean labour" of reading two hundred and fifty of them; and of very little use apparently were they found to be. There have been a great number of such works since, some of them of the most elaborate and pretentious kind; but complaints as to the uselessness of cookery books are still universal, and, judging from results, certainly seem to be well founded. The only people apparently who can make much use of recipes are very accomplished cooks. When one of these wishes to learn the composition of a dish which is new to him, a recipe will usually give him all the information he wants; but with ordinary cooks—or, at least, with ordinary English cooks—the study of instructions usually results in the spoiling of a considerable amount of good material. Cookery books are therefore useful in the same way that directions for money-getting might be useful to millionaires. It is not easy to understand why such works should be of so little practical value, inasmuch as it appears at first sight as though cookery was a kind of work which could to some extent be mastered from written instructions. In preparing food for the table certain substances have to be exposed to the action of heat until certain changes have taken place in them. The amount of material to be used for a dish, the degree of heat to be applied, the time necessary to bring about the desired conditions, can all be precisely stated. Putting aside very complex preparations, and others which require extreme quickness and promptitude, are there not a very large number of dishes for which written instructions might be given that could be followed without any very great difficulty and with the certainty of a satisfactory result?

In spite of the failure of cookery books innumerable, we are disposed to believe that a work which would be really useful in ordinary kitchens might still be written if the conventional method of drawing up recipes were departed from, and if very simple means of ascertaining temperature, which are now altogether neglected, were made use of. The fact that in an English kitchen a cookery book is nine times out of ten nearly useless is due to three causes—the stupidity of cooks, the ignorance of mistresses, and the want of clearness and fulness in the instructions given. The first difficulty, of course, which has to be overcome in getting a dish prepared is the dulness and apathy of the ordinary English cook. Given a recipe, she proceeds to interpret it according to a marvellous system of her own, the leading features of which commonly appear to be that materials having strong flavours are to be largely used, and that an intense heat applied for a short time produces precisely the same result as a moderate heat applied for a long time. To run counter, indeed, to the most simple and best established rules of cookery seems to be the special delight of the ordinary female domestic, and it may be thought that so dense is the stupidity of women of this class as to make anything but very simple dishes impossible in most English households. Perhaps, however, it might not be impossible to overcome to a certain extent their dulness and perversity, to introduce variety into daily meals, and to make dinner parties possible without putting an imperious and extravagant stranger in command of the kitchen, if only some intelligence and knowledge were brought to bear on culinary matters, or, in other words, if the mistresses of houses would take the trouble to learn their work, and would gain some acquaintance with the processes of French cookery. Ignorant people are not likely to be improved by ignorant supervision, and very ignorant is, commonly speaking, the supervision of the British matron. The mistress of a French house can generally, when a dish served at her table is unsatisfactory, say what is wrong with it. An English lady is hopelessly puzzled if her *entrées* are unfit to eat, and can only declare that the cook had very good recipes, but that in some unknown way she has departed from them. Not unnaturally perhaps the cook pays no attention to the fault-finding of an incompetent critic, and continues in a state of hardened sin. A very moderate amount of trouble in learning something about cookery would give the mistress of a house such knowledge as would enable her to criticize her cook's work to some purpose, and perchance, by pointing out the precise nature of shortcomings, to cause amendment; but this knowledge the mistress of a house does not, as a rule, think it worth while to obtain. The afternoon tea which adds so largely to her medical man's income makes dinner a matter of indifference to her, and, disposing of all difficulties by saying that people must not expect work like that of club *chefs* in private houses, she remains in a condition of wilful ignorance almost as lamentable as that of her servant. Clearly, where there is such apathy and indolence on the part of the superior, and such perverse stupidity on the part of the subordinate, cookery books are not likely to be of much service, and the consequences of attempting to use them may be painful in the extreme.

Where, however, things are differently ordered, where there is intelligence and goodwill, where the mistress of the house has some knowledge, and the cook is painstaking, the study of recipes is not always followed by satisfactory results. Great care is taken and directions are strictly followed, but nevertheless only insipid dishes are produced. The reason for this failure, which too often occurs, is to be found in the fact that recipes have generally been drawn up by men who thoroughly understood the practical work of preparing food, but had not the capacity necessary for giving written instruction. Recipes are usually wanting in clearness and fulness, and there are frequently such gaps in the description of cooking operations as can only be filled up by those who have a considerable knowledge of culinary work. As we have said, a recipe is often of use only to an accomplished cook. It would be easy to verify this by analysing the accounts given in some of the best-known cookery books of the principal processes followed in the preparation of food; but to do this would require a detailed and technical description of kitchen work. One shortcoming on the part of the authors of cookery books may, however, be pointed out, as showing how very narrow and dull they have been. Each speaks with contempt of his predecessors, and each follows precisely the same plan as his predecessors, failing to see what might be thought the most obvious improvements on their method of description. So far as we are aware, no systematic effort has ever been made to record the temperatures at which different sorts of foods are cooked. No doubt, with some kinds of cooking this, though not impracticable, would be extremely difficult; but with others, and amongst them the most important, it would be easy enough. It would be necessary only to state the precise quantity of fluid and of each solid, and to say how long certain temperatures were to be maintained. The use of a thermometer would remove all chance of error; but the idea of using one does not seem to have occurred to any cook who has published a book for the information of the world. It was, however, suggested by an amateur who wrote a very amusing work on the processes of the French kitchen and the titles of French dishes.

While writers on cooking are so careless as to overlook such an obvious aid to instruction, it can hardly be expected that their works will be valuable, or that much practical knowledge will be gained from the study of them. That cookery books should have been hazy in Dr. Kitchiner's time, and that he should have failed in his well-meant effort to give unmistakable directions, is not surprising; but it is certainly remarkable that now, when the subject has received so much attention, works of this class should still be so crude and confused. A really good cookery book yet remains to be written, and at a time when the desire for literary distinction is so general we would suggest this subject for the consideration of young and ambitious authors. The union of large natural gifts with great powers of labour would no doubt be requisite for success; but success, if attained, would be without a parallel.

MODERN DANCING.

AMONG the topics of small talk current in a modern ballroom nothing is more commonly made a matter of comment than the improvement which the last few years have developed in modern dancing, round dances only being understood by the term dancing. The self-complacency of the remark is tempered by the admission which it involves, that its author is personally included in the condemnation implicitly passed on the dancing of society in its unregenerate days. Usually there is no reluctance in confessing this, and the satisfaction of contemplating present excellence receives a sober tinge from the reflection that time was when this excellence was not. It is the prayer of the Pharisee refined; we congratulate ourselves, not so much that we are not as other men are, as that we are not now what once we were.

With each rising generation the novel charms of present practice outdazzle the sober attractions of memories of the past, and this must be allowed for in estimating at their true value modern praises of the modern waltz. But when all has been said and done, the broad fact remains that, within the last few years, waltzing has advanced from a form of exercise to something like an art. Passing over minor details of style, the principal points of improvement seem to be a keener appreciation of time, and a mode of motion more equable, more rhythmic, and hence more graceful. Both of these are in a great measure due to an alteration in the character of modern dance music. The uneven melody of waltzes like the "Mabel," and the rattle of the now almost obsolete galop, have yielded to a strain which, whether melting into languor or swelling into passion, is ruled throughout by an inexorable three-time which bends the wildest vagaries to its sway. This is certainly the cause of the added grace which the mode of motion in waltzing exhibits. There is a dreamy magic about the measure which the limbs of its votaries cannot long resist, and which has charms to soothe into sobriety even the frantic violence of a provincial *deux temps*. Contrasted with the style which it has supplanted, it is like the quiet might of an Atlantic

roller in mid-ocean compared with the choppy seas of the Channel. But the main cause of the improvement lies deeper than this, and is to be found in the keener musical sense of the age, which has at last brought people to recognize that true dancing consists in a motion of the whole body in time with the music, not in the execution of certain steps with more or less mechanical accuracy, to which the accompaniment of music is merely a superfluous luxury. Nor is it in this respect alone that the old order changeth; the uniform rotation which contented our simple forefathers has given place to a series of complicated movements, wherein no invidious preference is given to any particular form of progression. As fancy dictates, or the exigencies of steering require, the skilled performer glides forwards or backwards, or winds away in a "reverse." Upon this latter practice much abuse has been heaped, and not without some justice; but, on the whole, it must be reckoned a gain. The questionable taste of a person who, after a preliminary stagger, hurls himself and his partner in the teeth of the stream of other dancers, is probably obvious to everybody except the offender. Still, if the practice be used and not abused, the testimony is well-nigh universal which tells of the relief it affords to physical exhaustion and giddiness, apart from its merits as a means of avoiding collisions.

So far our strain has been one of almost unmixed eulogy; but there is another side to the picture. Μαθήματα παθήματα—greatness has its penalties as well as its privileges, and it may be doubted whether those who know the art best enjoy it the most. As a nation, we are supposed to take our pleasure sadly, and certainly our dancers furnish some brilliant examples of this national characteristic. Whether the pleasure is of that intense sort which is akin to pain, or whether some dim prescience of the future greatness of their art oppresses the minds of proficient waltzers with a sense of painful responsibility, we do not presume to decide; but certain it is that during their performances they usually assume an air of solemnity which approaches the lugubrious. Curiously enough the converse may often be noticed. Probably no one enjoys a ball more keenly than a dancer of the orthodox uncompromising *deux temps* school. Beaming with joviality, he bursts upon the throng; the wary and the forewarned are on the alert, and give him a wide berth; but woe to the luckless couples upon whom he falls, for they run no small chance of being ground to powder. Strips of severed raiment, and such facial contortions as genteelly suppressed agony permits, attest the resistless energy of his course. Fortunately his is a mode of motion which is rapidly converted into heat, and exhausted nature soon brings him to a standstill, exhibiting the plainest traces of a partial dissolution of his too solid flesh. Nevertheless he is game to the end, and between his gasps exclaims triumphantly to his partner, "That was a capital turn." To do him justice, he is perfectly unconscious that he is the curse of the ballroom; and he lays no claim to excellence in dancing, such enjoyment as he derives from it differing little from the pleasure that a healthy animal takes in exercise.

There is yet another type of bad dancer to whom dancing is a source of subtle joy, but with him the pleasure is due to a secret conviction of his own superiority. This is the man who regards with equal contempt the modern *trois temps* and the *deux temps* of ancient days; to him the latter is an exhibition of barbarous violence, the former is a lurch. His notion of waltzing is to circle stealthily round his partner at any pace which commends itself to his sense of fitness. He disregards time as completely as the *deux temps* dancer; but, as a sort of concession to popular feeling on the subject, he punctuates his movements by a series of curious dips. Of himself he will probably say that he dances the "old" *trois temps*, or more commonly the "real" *trois temps*; and, murmuring some such confidence to his partner, he begins his rather elaborate revolutions, at the same time composing his face into a smile which, for sweetness and play of feature, might rival the expression of a Chinese idol.

We have said that the prevailing tendency of modern dancing is in the direction of quiet grace. But, in opposition to this, the partial popularity of such dances as the polka and the schottische presents a strange anomaly which must not be overlooked. Dances of this description may be regarded as a reactionary impulse in which the forces of disorder find convenient expression. There is not much to be said on behalf of the polka as it is too often danced. But this is the fault, not of the dance, but of the dancers. A short time ago it was our privilege to have pointed out to us "the best polkist in London"; and the peculiar charm of this gifted person's dancing appeared to be the facility with which he flung his partner on the floor. Probably the dance owes some of its popularity to the fact that it can claim to be reckoned as a "round" dance. It is a sort of social compromise; and accordingly a lady is enabled to put off with a polka a partner whose feelings would be outraged by the offer of a "square."

The case of the schottische is rather different. In spite of being disguised under a foreign name, it is of genuine Highland origin, and is stamped with the genuine peculiarities of Scotch dancing. Broadly speaking, the distinction embodied in these peculiarities may be expressed by saying that, whereas the ideal of English dancing is a nearly horizontal movement, the salient feature of Scotch dances is the vertical motion of the steps employed. In their peculiar style these Scotch dances are capable of a high degree of artistic excellence, and with a proper environment are extremely interesting. On their native soil, and danced by persons among whom the associations with which they are linked still linger, the enthusiasm which they evoke is perfectly intelligible; but they seem somewhat out of place in a London drawing-room. There exists, moreover, in connexion with them a practice which we conclude is an inseparable accident of their proper performance; we refer to the barbaric yells in which the pent-up emotions of their votaries seek relief. These may have been most appropriate in the mouths of heroes of the Mic-Mac Methuselah type; doubtless the last moments of "ta great MacPhairson" were soothed by the chivalrous tribute of the "three warlike howls" with which his victorious enemy preluded the fatal blow at his vitals; but since the practice of disembowelling has ceased to obtain as a mode of expressing personal differences, such utterances lose much of their point.

What may be the future destiny of the waltz is a matter of some doubt. Its rapid development in the last few years has given it something of a professional character, which has caused it to be regarded with a certain amount of antipathy or distrust. Unfortunately, also, it is not always the best dancers who are in other respects the most socially desirable acquaintances. And it may be that a combination of some such considerations will banish waltzing, for a time at least, from the upper strata of society. While recognizing the possibility of such an occurrence, we think it would be one to be deplored. With us, as with most nations, civilized or savage, dancing has at all times found a place among the number of social accomplishments. Early in the century, the figure dances which then prevailed yielded the palm of popularity to the waltz, and we are probably safe in saying that their glory has departed for ever. And this is no matter either for marvel or regret. The correlation of bodily and mental phenomena is established beyond the possibility of question, and the law of causation, whether its action be obvious or obscure, applying alike to things great and to things small, regulates our most trifling physical movements no less than our profoundest intellectual judgments. And therefore, if we can but interpret aright, we may as surely look to find in the amusements of a nation some expression of its aggregate mental state as we may expect to see it adapt its clothing to its climate. Accordingly, if we take into account the amazing development which this century has seen in every branch of intellectual and æsthetic culture, we may cease to wonder that the stately but passionless beauty of the minuet should fail to satisfy the quickened emotional cravings of the present generation. If the waltz has lost something of the grace of the older dance, it has gained in what may be called poetic power; and this is the secret of its success. As an emotional outlet, it meets more fully the requirements of the age which has given it birth; or, as it may be expressed in the language of evolution, it supplies a more complete adjustment of our inner to our outer relations. And the truth of this is in no way affected by the fact that modern opinion condemns the older methods of waltzing as imperfect; for the same process of evolution which caused the minuet to be discarded for the waltz has effected, and will doubtless continue to effect, important modifications in the form of the latter. Therefore, that dancing as an art, in its latest expression, the waltz, should exhibit an increasing elaborateness in response to the increasing complexity of our mental organization, is at once both natural and proper. Indeed the wonder is that, as an art, it should be still so imperfectly developed. If a person ignorant of music, or wholly destitute of a voice, should assume to inflict upon society his crude efforts to sing or play, the act would justly be resented as an impertinent outrage; and it is not easy to see why the same social censure should not fall upon the head of the unskilled dancer, whose unlovely antics, besides causing serious physical inconvenience to his neighbours, are a gross desecration of the poetry of motion. That such things are tolerated is due to our relatively incomplete recognition of the æsthetic element in dancing, compared with that which we accord to the sister art of music. But, though we may admit this incompleteness as a present fact, we need not suppose that no improvement is possible, and still less lament any tendency in this direction.

To some persons the subject may seem too trivial to deserve serious attention; but such a view will probably in the long run give way to the growing artistic feeling of the age. Seeing that art is daily becoming more and more closely interwoven with the habits and surroundings of our existence, it seems scarcely too bold to predict that the future is not far distant when the eye shall grow musical as well as the ear, and the æsthetics of rhythmic motion shall receive some share of the cultivation now bestowed upon harmonious sound. Should this point ever be reached, we may have reason to be grateful to dancing for having added one more to the number of artistic interests whereby we seek to make gracious our lives.

THE FRENCH STAGE A CENTURY AGO.

IT is a trite remark that the theatre plays a far more important part in the life of an ordinary Parisian than of an ordinary Londoner; and proofs of its truth abound in such volumes as the *Soirées Parisiennes*, collected from the *reportage* of the *Figaro*, in the many sketches and biographies of actors and actresses which are constantly issued, and in the more solid records of the dramatic events of each year which are well represented by *Les Annales du Théâtre et de la Musique*. For the sixth issue of this, compiled and written by MM. Edouard Noël and Edmond Stoullig, a preface has been composed by M. Henri de Lapom-

meraye, who points out the value of such an undertaking as that of MM. Noël and Stoullig, remarking that it would be a very pleasant thing to have such a summing up of the dramatic events of 1779 as he here finds of the dramatic events of 1879. He then goes on to supply the deficiency as to 1779, as far as he can, from "des *almanachs* fort précieux mais dont la nomenclature sèche et aride ne dit quelque chose que si l'on complète et vivifie la statistique par l'histoire littéraire du temps; or c'est là toute une longue besogne." M. de Lapommeraye has, however, disinterred various interesting facts from these *almanachs*. He begins by contrasting the operatic events of 1879 with those of the corresponding year in the last century. Little happened at the "Académie Nationale de Musique" in 1879; but on the 18th of May in 1779 the same Academy produced Gluck's *Iphigenia in Tauris*, which excited as much enthusiasm and opposition as in later days Herr Wagner's operas have excited at other theatres. M. de Lapommeraye gives a story of the time for which many parallel stories of later date might be found. Some one remarked, "qu'il y avait de beaux morceaux dans cet opéra." To this the Abbé Arnaud replied, "Il n'y en a qu'un." "Lequel?" "L'ouvrage tout entier." M. de Lapommeraye might have added the somewhat interesting fact that Gluck was sixty-five years old when he composed *Iphigenia in Tauris*. Two days before the production of Gluck's opera (his masterpiece M. de Lapommeraye somewhat rashly calls it), there was given on the same stage "un intermède italien, dont la musique est de Piccini — *Il Vago disprezzato* ou le Fat méprisé." The writer goes on to say with rhetoric that verges upon the ridiculous, that the names of Gluck and Piccini are characteristic of their epoch just as were the names of Franklin and Lafayette. He might as well, writing according to his own ingenious idea for the next century, talk of MM. Gounod and Lecocq as characteristic of the present epoch. Piccini had this advantage or disadvantage over Lecocq that he wrote no less than three hundred operas, to say nothing of oratorios. One thinks with a shudder of Alexandre Hardy the French dramatist. M. de Lapommeraye gives a list, which it must have cost him some trouble to compile, of various operas produced in 1779, in which we find mixed such incongruous names of composers as those of Traetta, Anfossi, Gardel, Sacchini, Paisiello, and Christian Bach. A story which M. de Lapommeraye tells of Sophie Arnould, introducing it with a perhaps unnecessary reference to the conduct of a distinguished French actress on a recent occasion, is curious in more ways than one. Sophie Arnould, it seems, called out to Francœur, the conductor at the opera, "What is the meaning of this? There seems to be a mutiny in your band." "Mutiny?" replied Francœur, "We are all here on duty in the King's service, and the duty is a pleasure." "I should like to make my duty a pleasure," replied Sophie Arnould, "but your band interrupts me and prevents my singing." "Cependant, mademoiselle, nous allons de mesure." "De mesure, *quelle bête* est-ce là? Suivez-moi, monsieur, et sachez que votre symphonie est la très-humble servante de l'actrice qui récite." It might be well if some conductors of the present day would think over this somewhat unpolished, but not the less sensible, retort of Mlle. Arnould's. The function of the orchestra in opera always has been, and we trust always will be, to accompany the vocal parts. One of the many accusations brought against Herr Wagner is that he has subordinated the voice to his instrumentation, an accusation which is not supported by study of his scores. It is only on rare occasions and for special purpose and effect that he seems to think more of the orchestra than of the voice. Speaking roughly, he seldom if ever makes a solo voice passage the complement of the orchestral music instead of making the band act as a support to the voice. In his choruses he is more open to blame in this respect; but it must be said that few lovers of music would care to have the scoring of his choruses changed. The fault of which Sophie Arnould complained a century ago is but too common still; and now, as then, the responsibility for it rests with conductors, and not with composers. Few opera-goers (and here we mean by opera-goers people who go to the opera because they love music) have not suffered from the intolerable noise which, in many passages of many well-known operas, conductors produce, thus giving the singers the unhappy choice of either remaining practically silent or straining their voices to an unnatural and disagreeable extent in order to keep up with the horrible din of the band.

From the opera M. de Lapommeraye passes naturally to the Française, and speaks of Préville, Brizard, Molé, Dugazon, Des Essarts, De Larive, Vanhove, Courville, Dorival, Florence, and Ponteuil. Vanhove, "qui jouait les Don Diègue, le *vieil Horace*," taught the science of acting to his daughter, who afterwards married Talma, and with whom Robespierre fell in love. Préville was for thirty-three years the leading actor of the Française, and to judge from a quotation made by M. de Lapommeraye from Dazincourt he seems to have been a kind of mixture of MM. Delaunay, Got, and Coquelin. "Nouveau protée, nul avant lui n'a présenté au public plus de variété dans les personnages; *crispins, manteaux, financiers, amants, tuteurs, valets*, tous ces caractères ont été embellis de son génie créateur." To this general encomium Dazincourt adds, as a particular instance of Préville's skill, this anecdote. "He concealed his own identity so completely in that of whatever character he represented, that one night at Fontainebleau when he was playing Larisolle in the *Mercure galant*, the official stationed at the wing seeing him approach with his degraded appearance, met him half-way and told him to be off." Too much importance is perhaps attached to stories of this kind concerning actors of a past age. Garrick is the hero of many such anecdotes, and there are almost as many criticisms extant of his performances which tend to show that, great as he was in certain parts, he was not the supreme and perfect master of every branch of his art which popular estimation supposes him to be. It is indeed incredible that either Garrick, Préville, Talma, Macready, or, to come down to the present day, Mr. Irving, should be equally good in every part included in a wide range. To our thinking, an actor cannot be called great unless he possesses, besides a marked genius, a certain amount of versatility; but that any actor, however great, should be equally successful in the parts of "crispins, manteaux, financiers, amants, tuteurs, valets," is inconceivable. Molé, for instance, admirable as he was in a certain type of part, appears never to have attempted anything beyond the line in which he first obtained success. He was, as M. de Lapommeraye reminds us, "the type of elegance and high breeding and, to cut the matter short, the first and perfect Almaviva in the *Mariage de Figaro*." To this is added, with a strange air of vagueness, the statement that it was to Molé "qu'un jeune auteur remit un jour un rouleau de papier blanc qu'il développa devant lui, après que le comédien lui eut déclaré qu'il avait lu la pièce et qu'elle était détestable." Somewhat similar stories have been and are current in the present century, and people who know to what trials managers and actors are constantly exposed, in the matter of so-called plays submitted to them by writers who are utterly ignorant of the art of play-writing, may without much difficulty think that Molé's sin was venial. Of De Larive M. de Lapommeraye tells us that he was handicapped by succeeding Lekain and preceding Talma; "il est écrasé entre ces deux colosses de l'art tragique. M. Alphonse Royer, qui a connu Larive, nous conte que ce tragédien lui a déclaré, en 1823, n'être jamais retourné au Théâtre Français, même comme spectateur, depuis que *ce petit Talma* y régnait en maître." One of the most interesting of the events which M. de Lapommeraye has rescued from semi-obscurity is the account of the performance on the 31st May, 1779—the anniversary of Voltaire's death. On this occasion *Agathocle*, "tragédie en cinq actes, qui avait été composé en même temps qu'*Irène*," was given. Voltaire, forty days before his death, had suggested the cast for this play. On the 20th of April, 1778, he wrote, "It seems to me that Molé and Larive 'joueront bien les enfants d'Agathocle, qu'Yduesau convient fort à Montel, que les cheveux blancs et la voix de Brizard suffiront pour Agathocle, et que le rôle d'Ydace est beaucoup plus dans le caractère de Mme. Vestris que celui d'Irène, pourvu qu'elle se défasse de l'énorme multitude de ses gestes.'" The last provision shows a close observation of a common fault to which many comedians, French and English, might still pay attention with advantage to themselves and to their audiences. The cast which Voltaire designed was not completely carried out, and, unfortunately, the exact programme of the performance of *Agathocle* cannot be found. It is curious to find that, before its production (on May 31, 1779), Vanhove, who was *semainier* for the week, had thought it necessary to send a circular to all the other writers who had pieces waiting for production, and it is pleasant to learn that none of these writers claimed precedence. They order these matters differently, if not better, nowadays.

We have been led into dwelling chiefly on the many interesting subjects suggested by M. de Lapommeraye's preface to "Les annales du théâtre," to the exclusion of much curious and, to the student of the theatre, valuable matter contained in the book itself. We regret this the less because it would be impossible within the limits of an article to convey an adequate notion of the amount or quality of the information which the volume contains.

REVIEWS.

M. GUIZOT IN PRIVATE LIFE.*

MRS. SIMPSON is fortunate in the opportunity of presenting to English readers a singularly interesting book. Her translation is in accuracy and idiomatic grace worthy of the original and of the subject. There is scarcely a phrase in the book which betrays the translation from French to English. Mrs. Simpson appropriately quotes from a former publication of her own Mr. Senior's remark after a visit to Val Richer in company with his daughter that "M. Guizot is never greater or more amiable than in his own family." In another part of Mr. Senior's "Conversations" M. de Tocqueville says that "M. Guizot is always charming. . . . He is a perfect picture of an ex-statesman, *homme de lettres et père de famille*, falling back on literature and the domestic affections." As M. Guizot survived for nearly thirty years his retirement or exclusion from public life, he was happy in his faculty of occupying himself with literary pursuits, and in the domestic society of two or three generations of his descendants. His Norman home of Val Richer presents in Mme. de Witt's incidental sketches a singularly attractive picture of the kindly patriarchal life which is common in France and almost unknown in England. His two

* *Monsieur Guizot in Private Life*, 1787-1874. By his daughter, Madame de Witt. Translated by M. C. M. Simpson. London: Hurst & Blackett. 1880.

daughters with their husbands, their children, and at last their grandchildren, his son, and his son's family, resided either wholly or occasionally in M. Guizot's house; and a sister and an aunt of the sons-in-law also formed a part of the elastic and united family circle. The head of the house was the favourite and the confidant of more than one generation of children. While he directed the Government of France, he found time to choose dresses and buy ornaments for his daughters, who were then entering for the first time into society. The tenderness of nature which caused him to feel domestic sorrows deeply was inseparable from the chief pleasures of his daily life; but after heavy losses he was never free from anxiety for his surviving children. No fallen statesman has borne with more cheerful dignity the collapse of his schemes and his hopes. Fortunately for himself, he was an able and popular writer as well as an orator and a Minister; and he had no difficulty in resuming his early occupations. At eighty-seven years he had in the course of nature outlived the many friends whom he had loved and esteemed. In one of his later letters he remembers with especial affection the Duke of Broglie and Lord Aberdeen.

It is well that Mme. de Witt's domestic records stand wholly apart from M. Guizot's published Memoirs, which left a less agreeable impression. His apology for his political career was too monotonous in its complacent self-satisfaction. He had done great services to his country; he was above suspicion of personal meanness or obliquity; and he was through life consistent in his love of ordered liberty, and in his antagonism to anarchy and revolution. He also attached great and perhaps just value to the share which he had taken as Minister of Public Instruction in the promotion of national education. His conviction that he had preserved the peace of Europe was so far justified that he assisted the King in repressing the turbulent policy of M. Thiers in 1840, and that there was no war during his tenure of office; but his conduct of foreign affairs brought his country more than once to the verge of an unprovoked rupture with England. His defence of the Pritchard outrage disturbed even the calmness of Sir Robert Peel, with the characteristic result of qualifying M. Guizot's admiration of the great English Minister. "Peel," he said, "is not so perfect a statesman as Aberdeen, for Peel sometimes regarded me with suspicion, while I always possessed the unqualified confidence of Aberdeen." He may be pardoned for expressing after his own fall a natural satisfaction in the temporary overthrow of Lord Palmerston by his dismissal from office through the agency of Lord John Russell. There were faults on both sides, and, with or without reason, Palmerston, unlike the leaders of the Conservative party, habitually distrusted the austere French Minister, and took little trouble to conceal his opinion; yet Palmerston did him the service of providing the flimsy pretext by which alone M. Guizot attempted to excuse the worst act of his life. If Lord Aberdeen had been at the Foreign Office, M. Guizot might perhaps have declined to forfeit his good opinion by the monstrous Spanish marriage. His domestic policy admitted of a better defence, for subsequent events proved the weakness of the dynastic Liberals and the incapable violence of the Republicans. Yet M. Guizot ought to have been convinced by experience that he had made a mistake in refusing any modification of the electoral system. Not only was the constitutional base too narrow for the superstructure, but the methods by which the King and his Minister controlled the elections necessarily involved corruption. M. Guizot would have been too proud to profit by a job, but he had no scruple in offering to his supporters inducements which were scarcely distinguishable from bribes. But for the weakness of the King the miserable outbreak of 1848 might have been suppressed; but it was scarcely possible that M. Guizot and his knot of electors should continue long to rule the country. It is true that the ability of the representatives, as in some other countries, bore an inverse proportion to the number of their constituents. No later Assembly has been equal in eloquence or general capacity to the Chamber in which Guizot contended with Thiers, with Berryer, and Lamartine. Of all the great competitors, Guizot was, in the judgment of many competent critics, the first. Not only an orator, but a debater, he held a position in the Chamber scarcely inferior to that which had once belonged to Pitt in the House of Commons. Others preferred the vivacious ease of Thiers, but no third rival was placed on a level with either.

It is pleasant to turn from political controversies to a private and domestic life which, if Mme. de Witt's loving testimony may be accepted, seems to have been faultless. His father and mother, André François Guizot and Sophie Elizabeth Bonicel, were both descended from old Protestant families; and by one of the strange anachronisms which partially explain the excesses of the Revolution, they were married in 1786 by a pastor whose ministry was still proscribed, so that neither the marriage nor the birth of their famous son, François-Pierre-Guillaume, in the following year could be legally registered. It is not surprising that M. André Guizot, an able and rising advocate, eagerly welcomed a revolution which at least put an end to the relics of obsolete tyranny. Not less in accordance with the course of events and the spirit of the time was his judicial assassination under the more brutal and more murderous despotism of Robespierre and his accomplices. Mme. Guizot remained for fifty-four years so faithful to his memory that, although she devoted her life to her children, and afterwards to the children of her son, they seem never to have engrossed her whole attachment. She was in narrow circumstances; but she contrived to give her sons a complete education at Geneva under her own inspection and with her constant aid. Her eldest son at the age of eighteen left her to study law at Paris, though he wished to devote himself exclusively to literature. After a time Mme. Guizot acquiesced in his wishes; and he soon made himself known, and mixed with the best literary society. At the age of twenty-five he was appointed to the chair of Modern History, specially created for him by M. de Fontanes, then President of the University. On the Restoration he was, on the recommendation of M. Royer Collard, made Secretary to the Ministry of the Interior under the Abbé de Montesquiou; and after the flight of Louis XVIII. he accepted a mission to the King at Ghent on behalf of the party of Constitutional Monarchy. In after years his opponents never ceased to hold him up to popular odium as "the man of Ghent." Another denomination which he shared with many of his friends receives from Mrs. Simpson an explanation which will be new to most readers. The name of *Doctrinaire* was given to the followers of Royer Collard, because in his youth he had been educated in a college of *Prêtres Doctrinaires*, belonging to a secular congregation called the *Doctrine Chrétienne*. Soon after the second Restoration M. Guizot, during the ascendancy of the extreme Royalists, retired from office, and resumed the historical lectures on which his early reputation was principally founded. M. Decazes in 1819 created for him an important office under the title of Director of Commercial and Departmental Affairs; but in the reaction which followed the assassination of the Duke of Berri in the following year, M. Guizot was deprived of his office and of the rank of Councillor of State. His lectures were in 1822 prohibited for several years; but they were resumed in 1828, when M. de Martignac was making the last attempt to induce Charles X. to reign as a constitutional king. In the previous year M. Guizot had been elected Deputy for Pont l'Evêque and Lisieux; and he soon became one of the leaders of the party which was equally opposed to absolute monarchy and to revolution. No politician has been through his whole life more thoroughly consistent. During his mission to Ghent, in his books, in his chair as a professor, in Parliament, and in office, he never wavered in his devotion to constitutional monarchy, though he cultivated no sentimental feeling of personal loyalty. A Republic, he said, after his fall from power, would have suited him well enough, if Republics in France had not been associated with democratic revolution. On the accession of Louis Philippe M. Guizot entered his first Cabinet; and thenceforth his career forms a part of the history of the time. In private life, his happiness was only disturbed by the deaths of members of his family.

M. Guizot's first wife, Mlle. de Meulan, was a lady of noble family many years older than himself. Their acquaintance began with assistance which he afforded her in literary employments by which she eked out a slender income. By a natural process intellectual sympathy ripened into a warmer feeling, and their marriage, notwithstanding the disparity of years, was thoroughly happy. Within a year after her death, in 1828, M. Guizot married her niece, Mlle. Dillon, of whom her daughter says that "true happiness is a rare and salutary spectacle, and it was afforded by Mme. Elisa Guizot to all who approached her, as long as God permitted her to live. . . Even her best friends can hardly call to mind or separate the details of her individual life; it was henceforth so entirely absorbed in that of her husband, so devoted to his interests, his affairs, and his occupations. She worked for him, she observed for him, she read and talked only for him." Unfortunately, she died in 1833, leaving two daughters and a son. His eldest son, by his first wife, Francois Guizot, had become at a very early age the confidential friend and companion of his father, when he also died. M. Guizot survived his wife and son for forty years, but his grief for both always retained its freshness. To his son he sometimes applied the well-known saying of the Duke of Ormond, that "he would rather have his dead Ossory than the best living son in Christendom." One of his consolations for his domestic losses was found in assembling round him all that remained of the Meulan family. His first wife's sister-in-law, his second wife's stepfather and his son, and his second wife's nephew, lived under M. Guizot's roof, which was afterwards to shelter and unite a younger generation. None of the letters in the present volume are more interesting than those which he wrote to his daughters while they were still children. One letter contains an account of a visit to Windsor while he was Ambassador in England. His girls must have been delighted with his account of winning a lottery on the Ascot Cup, and of his missing his way at night in the Castle, and mistaking the Queen's room for his own. His mother, after the death of his second wife, undertook the care of his children with a zeal and devotion which verged on austerity. When M. Guizot, in consequence of the revolution of 1848, was forced to take refuge in England, Mme. Guizot, then at the age of eighty-four, at once joined him; but the agitation and the fatigue of the journey proved fatal; and she died within a few days of her arrival in London. During his enforced exile of a year and a half, M. Guizot occupied a small house in Brompton. One of his daughters, who had lately lived in the splendid Hotel of Foreign Affairs at Paris, said in answer to an enquiry by an English friend whether she often went into the Park, "No, they won't admit our carriage, the omnibus." To M. Guizot's great satisfaction, his daughters, soon after his return to France, married two brothers, M. Cornelis de Witt and M. Conrad de Witt, with both of whom he formed a cordial friendship. His son William also married some years afterwards; and the children of the three families formed a constant subject of interest to the grandfather. He had the misfortune to survive his elder daughter, Mme. Cornelis de Witt,

whose death was caused or accelerated by her sufferings and anxiety while she was shut up in Paris during the siege without the means of communicating with her family. Though she was only forty-three, her hair turned white in the interval; and after several attacks of illness she died in the following year. Mme. Conrad de Witt has done justice to his memory in an admirable record of his life.

A STUDY OF SHELLEY.*

PEOPLE who take pleasure in the thought of what they call "subjective immortality," that is, of life prolonged in the minds and memories of men, can scarcely be comforted by the posthumous fortunes of Shelley. Queer and third-rate were too many of his friends in his mortal days; he was the intimate of vegetarians and crotcheteers, as well as of Byron and Trelawny. His "subjective immortality" in the writings of commentators, bibliographers, anecdote-mongers, has scarcely been more happy. One can imagine the wronged spirit crying to his admirers, "Can you not leave my commas and my private affairs alone, and permit the literary sins of my nonage to perish unnoticed?" But Shelley's private affairs, punctuation, and rude early sketches now furnish occupation to a tribe of industrious scribblers. Subjective immortality has its purgatories as well as its paradises.

It would not be difficult for a hostile or unfair reviewer to make fun of Mr. Todhunter's *Study*. The style of Mr. Todhunter is often that of a poet who has not quite made up his mind to be a critic. The swan is scarcely accustomed to walking on the dusty highway. Thus, especially in Mr. Todhunter's earlier chapters, there is a bewildering profusion of metaphor and of simile. Scriptural and poetical quotations are too frequent, and we grow particularly tired of "the new wine" of democratic ideas. The new wine is uncorked at least three times in the first forty-four pages. We must complain, moreover, that Shelley is compared to too many atmospheric and other phenomena. On page four he fills our sky with the golden light of dawn. On the same page his poetry is like vivid sheet-lightning, than which few things, except the electric light at the British Museum, can less resemble the golden light of dawn. On page 29 the poet's "moonlight seems to reflect the beams of some yet unrisen sun; and his sunlight has all the ethereal exhilaration of that of the first hours of a glorious day." Perhaps these meteoric inconsistencies are caused by Mr. Todhunter's own speculative uncertainty. He speaks of Shelley as a poet of democracy, and we have not succeeded in discovering whether Mr. Todhunter thinks democracy all moonshine, or whether he regards it as an intermittent force—like sheet-lightning—to be observed at general elections; or whether, lastly, and probably, he considers it the dawning power of a golden future. Mr. Todhunter is not at all the dupe of a belief in Shelley's, or apparently, in any other philosophy. He is perfectly aware, as we shall see, that the poet's optimism was crude and unpractical. But as he himself (p. 251-252) speaks about marriage as if it might be a merely provisional institution, it can hardly be wrong to look on him as a sympathizer with some, at least, of Shelley's wilder notions. But this passage is not very distinct, and Mr. Todhunter certainly looks forward to no immediate change in the constitution of the family. As an example of a milder inconsistency, it may be noticed that Mr. Todhunter speaks of Shelley's poetry culminating "in one keen, insistent, feminine shriek from the violin, strained up to a terrible pitch" (p. 5); while (p. 7) "his song is childlike rather than feminine." We can hardly agree with both propositions, but we especially dissent from the latter.

It will be observed that Mr. Todhunter's style, manner, and ideas are more or less immature. This is, perhaps, the chief fault in an attempt at "a philosophical study of Shelley's works, which shall assign him his true place in our literature." Mr. Todhunter has endeavoured "to study each poem as I believe Shelley himself would wish it to be studied, with a serious effort to comprehend the ideas which he desired to express in it." This effort is perfectly legitimate, for it is certain that Shelley did not pursue art for art's sake alone. He was possessed of certain notions on social and political matters, certain "criticisms of life," which, with a more or less consciously didactic purpose, he endeavoured to embody in poetry. But we cannot feel so sure that the best way to enjoy Shelley is to search for these ideas which the poet thought so valuable. It is quite certain that the ideas, the philosophy of Shelley, were valueless. They were the combined result of an extraordinary temperament and of extraordinary circumstances. Mr. Todhunter does not conceal his opinion that Shelley knew very little "of what is in men"—that is, of human nature. He judged the world by himself, and no man was ever less the "measure of the universe." At Eton (as a school companion of the poet's informs us) Shelley liked to go about alone, and he would constantly break into violent spurts of running, as if he were impatient of ordinary movement. This lonely, impatient, and objectless haste characterized all his early speculations, all the matter of which his first poems are the form. To this temperament the optimistic ideas of Rousseau and the theories of Godwin were congenial, and out of the current "advanced" notions of his time, Shelley framed his own vaporous philosophy. Mr. Todhunter speaks of Shelley's ignorance of "the natural history of man." That ignorance is at the bottom of all theories of man's original and natural perfection, now warped by "convention." Thus the ideas which Shelley meant to express are perhaps best disregarded.

In reading the *Revolt of Islam* or *Prometheus*, we prefer to be delighted by the music and the images of the poetry rather than to reflect carefully on the theories which Shelley meant his poetry to embody. It is not that we think ideas out of place in poetry, but that Shelley's ideas are of scarcely any but historical worth or moment. It is interesting, historically, to observe that a man of great genius thought thus and thus, but we may be allowed to let his notions blend and vanish in that aërial procession of beautiful form moving to beautiful music which is the poetry of Shelley.

Mr. Todhunter has thought otherwise, and has carefully analyzed Shelley's notions. His first chapter discusses, in language which might be less ornate and more clear, the "Personality of Shelley." The poet is contrasted with Mr. W. Whitman (we are sorry to see him in such company), with Blake, Victor Hugo, and the late Mr. J. S. Mill. Shelley has not "the savage sensuality" of Mr. Whitman; he is "the apostle of a new, if rather vague, religion," he "converts his impulses into principles," and "his actions have something of the beautiful unaccountableness of those of Goethe's Mignon." "Shelley ravishes us away, in a whirlwind of passion, into a region where the moral virtues appear to us much as small garden-plots might appear to Elijah in his fiery chariot." We regret that Mr. Todhunter has been ravished away into analysing *Laon and Cythna*, instead of the mature published work, the *Revolt of Islam*. *Laon and Cythna* was, we believe, suppressed by Shelley almost before it saw the light. The prodigious error which defaces it, Mr. Todhunter of course recognizes and deplores. That error is perhaps as much to be traced to a morbid quality existing for a time in Shelley's mind as to an explosion of his absurd philosophy. And as Shelley gave the world, not *Laon and Cythna*, but the *Revolt of Islam*, it was Mr. Todhunter's business to comment on the latter poem. A Shakspearian critic would not give his space and attention almost solely to the earlier version of *Hamlet*.

This necessary protest has led us away from the analysis of Shelley's philosophy. It was originally composed of a strong reaction against custom and convention, and that reaction, again, was the result of a belief in man's "natural" goodness, and in man's power of returning to natural perfection by a momentary exercise of the will. To open men's eyes, to awaken and stimulate the will to be natural and good, was the province of eloquence like Cythna's, of poetry like Shelley's. There are moments when Mr. Todhunter almost seems to think that Shelley's hopes have been fulfilled. "A faith such as his is a miracle-working power even in the real world; it makes the impossible possible. The poet who creates a new ideal, and fills men's hearts with the flame of a new desire, is a practical force in the stream of human development—and this Shelley has done." Has he? We are aware of no facts that prove it. Mr. Todhunter himself cannot help smiling at the rapid and complete moral conversions which reward the eloquence of Shelley's prophetesses and hermits. He says:—

> Shelley regards the miseries of mankind as due to some comparatively trifling aberration from an aboriginal state of perfection, to which all are capable of once more attaining. This aberration he accounts for on the hypothesis that some mysterious abstraction called Custom produces concealment, which produces hypocrisy, vice, and lust, which produce priests and kings, who in their turn produce all the evils of life.

And he adds that Shelley expected human regeneration "when the equator coincides with the ecliptic," while he frequently smiles at Shelley's belief in the sudden moral action of the will. He has no faith, or very little, in the Shelleyan creed that

> Love and joy can make the foulest breast
> A paradise of flowers where peace might build her nest.

On this theory, "when the enterprising burglar is not burgling," he may be a very moral man. But doctrines of this sort do not "create a new ideal," still less prove "a practical force in the stream of human development," and so they seem to us the worthless part of Shelley's work, the part of that work which scarcely deserves serious attention. In short, we fail to see that Shelley is "an awakening spiritual force," though he remains a poet almost solitary, and quite unsurpassed in many poetical excellences. But, as it appears that Shelley does spiritually awaken many undergraduates, there may be something in his verse which is concealed from our criticism. There is certainly something moving and pathetic in his theory of what may be called passive revolt:—

> And if then the tyrants dare,
> Let them ride among you there,
> Slash and stab, and maim, and hew,
> What they like, that let them do.

But no advice was ever less practical. We cannot follow Mr. Todhunter through his separate analysis of each poem. He neatly remarks that the didactic strain of *Queen Mab* is abandoned by Shelley for the mythical manner, which may be likened to the mythical manner of Plato. Ideas too exalted for daily life or for common comprehension Plato embodies in myths, like those in the *Gorgias* and the *Republic*. Shelley does the same in the *Prometheus Unbound*. We quote Mr. Todhunter's summary of the philosophy of the poem:—

> In this poem Shelley appears to have conceived of evil as arrest, abortion, retrogression, anachronism; the persistence of an obsolete something, a lifeless husk, a withering leaf upon the Tree of Life, which must disappear when the flowering time of Eternity is fully come. Accordingly, we find that there is a terrible slumbering power, lying in wait for Jupiter some-

* *A Study of Shelley*. By John Todhunter. Author of "Laurella; and other poems." London: C. Kegan Paul & Co. 1880.

where in the dark abyss of Eternity: *Demogorgon* (which Shelley might possibly translate, according to an obvious, though unsound, etymology, "the grim one of the people"), begotten by Jove himself—a spirit of rebellion stirred up by the spirit of tyranny, and disappearing with it for ever when it has dethroned its father. But this grim one is something more than this. Jupiter has apparently begotten him; yet he tells his father that his name is Eternity, and bids him "demand no direr name." He is, if we dare conjecture, nothing less than Divine Justice itself—the eternal Nemesis which pursues crime—that Something in the universe which inexorably decides that *this* has fallen short of typical perfection and must perish, that *that* has had its season and must pass away; and we may probably connect him with that all-powerful "reason," or moral necessity, which plays such an important part in Godwin's *Political Justice*. In the end he reappears as "the perfect law of liberty"—that law of which no jot or tittle shall pass till all be fulfilled, but of which love *is* the fulfilment; and it is as such, and not as the mere spirit of rebellion, that he dethrones the tyrannic and slavish law of the "Prince of this world," whose motive force is fear.

Probably the lyrics in the *Prometheus* give pleasure enough to readers who are content to do without "the meaning of this intense yet delicate breath of music, unearthly as a strain played in the highest register of united violins." We wish Mr. Todhunter would explain this explanation. His criticism of the *Cenci* is much more naturally expressed. His book is written, we think, in perfect good faith, and he has industriously attempted to qualify himself for his task. His faults of style are the faults of youth and of our time, and it is probable that in a few years they will amuse the author. Simplicity is one of the latest learned of literary lessons.

PROBLEMS OF LIFE AND MIND.*

IN this volume of some five hundred pages we have all that remains of Mr. G. H. Lewes's manuscripts in a state fit for publication. The chapters here presented were not written out for the press by their author, nor had they received his final corrections. Even the arrangement of the parts has been the work of the editor—the same editor under whose supervision the former volume, reviewed by us last year, was prepared for publication. And the last forty pages, dealing with the "Sphere of Intellect," are only a fragment of a Problem—a fragment possessing a personal interest from the fact that it was written hardly more than three weeks before the author's death. Under such circumstances, even when the hand of the most careful editor has done all that was possible for the notes consigned to him, it was inevitable that there should be some repetition, some want of sequence and connexion, some displacement and disorder. Parts of this volume are like the further workings of the author's mind upon problems raised and discussed before, and to which he felt the necessity of returning, not to unsay what he had said, but to try to say it otherwise. For instance, we have some fifty pages in the present volume on the nature of consciousness and unconsciousness. This discussion, here placed under the heading "Mind as a Function of the Organism," is a resumption of an exposition of the same view in the volume published in 1877, where it formed part of the refutation of the doctrine of "animal automatism." The restatement in the later volume even reproduces the same illustration—the antithesis of the feeling of light and the feeling of darkness—which had been employed before, though this is now reinforced by a second exemplification, drawn from the mathematical negative, which is not a denial or obliteration of the positive, but its other-sidedness.

But the circumstance that these sheets have necessarily wanted their author's last revision is not the sole cause of their detached and fragmentary character. It lay in the nature of Mr. Lewes's plan and method of working out his ideas, that there should be no attempt to present a complete scheme of thought, or to give his volumes the form and framework of a system of philosophy. That he himself knew and intended this we may infer from the title which is common to all the three series of which his work consists—*Problems of Life and Mind*. The generality, not to say looseness, of this title, which Mr. Lewes borrowed from Aristotle's well-known work, left the author as free and uncontined as he could wish to be. It was open to him to take up or to leave alone exactly as it might suit him. He did not on his title-page undertake to exhaust his subject, or to connect one chapter with another, or even to be consistent with himself. By this plan something, no doubt, is lost in connectedness of thought, in thoroughness of survey, and in that testing process which is supplied by reapproaching our pet view from ever-new sides, and looking at it again and again in all its possible relations. But, if something is lost, more is gained in the deliverance from the bondage of system-making and from the waste of thought occasioned by the attempt to give subjective harmony to our knowledge. And, in the present state of psychology, a treatise which should aim at being systematic would have to fill up gaps between the certainties of the science with many conjectural or hypothetical statements. Much of the freshness and originality of Mr. Lewes's volume is owing to his having adhered to the line of his own investigations, and not attempted an entire scheme of mind, or a chart of all the known and unknown regions of the human microcosm. The injury done by any dogmatic scheme of thought to the thinker lies not so much in any possible erroneousness of a single doctrine, as in the necessity under which he feels himself of trying every new impression by its capacity for being fitted into a place in the unalterable framework.

It must not be concluded from what is now said that Mr. Lewes's present volume is a rhapsody of unconnected fragments. It has, in an eminent degree, what critics are fond of calling "the higher unity" which springs from its being the genuine product of his own investigation, and not culled from the books of others. Nay more, though there is an absence of system, there are controlling ideas which focus the special and partial lines of inquiry. One such governing conception, which is fundamental to Mr. Lewes's psychology, and serves to combine his otherwise unconnected discussions, is that of the unity of all psychical processes. He is never weary of insisting that *parts* of the neural mechanism are analytical fictions, and that the sensorium is not any one fixed and defined organ of the central mass located in the brain, but the ideal conception of a movable centre. It is not the brain which thinks and feels, but the man. A feeling is the resultant of a complex of changes affecting the whole organism, changes in which present stimulations are blended with revivals of past stimulations. Every impression from an external source gives its particular direction; this is encountered by a variety of cross-impressions pouring in in a continuous stream, and blending into a group or total result. This final issue is the attitude of the organism. The total of such attitudes, the residual effects of past stimulations and reactions, constitutes the personality of the man, is the Ego. As experiences are multiplied and repeated, and more and more residua are stored up, there arises a co-ordinating system which renders us more and more independent of the immediate stimulus, more and more masters of the external. It modifies, annuls, or magnifies the impressions received, so that at one moment we are undisturbed by the roar of crowded streets, at another are distressed by the buzzing of a fly. Parodying the words of Tennyson, we may say, "I am the product of all that I have felt."

The necessity for insisting upon this unity of the inner life of the soul arises from the contrary practice which so long prevailed, and still prevails, with both biologists and psychologists. The distinction of the five senses, one of the oldest observations of a rude physiology, has not ceased to exercise an influence on biology; and though the truth of the oneness of the organism is admitted, it is often forgotten in the working language of biologists. And psychologists, though they no longer map out the mind into a score of separate "faculties," as used to be the case half a century ago, still insist upon certain main lines of demarcation as constituting generic differences among the mental functions. Herbart, for example, than whom none of the system-makers has more strongly insisted upon the oneness of the primary element, or primitive mental state, still makes sensation, feeling, intellect, and volition, distinct parts or energies of mind.

The truth which Herbart thus seized by happy conjecture, and speculatively only without inductive confirmation, is now arrived at by physiology along the sure road of experiment and observation. It is in this volume adopted and expounded by Mr. Lewes with a rich variety of evidence, and carried with thoroughness into every psychological problem, the investigation of which it transforms, as it could not fail to do. The contrast between intellect and feeling seems obvious enough, and is well understood in practice and in speech. The psychology of the Greek schools was based upon the assumption of this fundamental antithesis, which was driven to an extreme point in the Peripatetic doctrine that the emotional soul was subject, along with the body, to decay and death, while the intelligence might continue to exist in a separate state. Such an hypothesis of a dual soul was very convenient for speculation, and corresponded roughly with a great number of the most common phenomena. But whenever philosophers made the attempt to approach the distinction more closely, and to assign the specific marks by which the ultimate facts of consciousness could be thus classified under the two heads of feeling and intelligence, they were always baffled in the attempt. In Mr. Lewes's treatment of life and mind the distinction between thought and feeling entirely disappears. For many practical purposes he will allow us to continue to speak of thought as if it were something wholly different from feeling; but the ultimate analysis of the facts of consciousness reveals a series of states, beginning with a stimulation and ending with a movement, each state in the series being compounded of the same elements, the difference between one state and another being constituted partly by succession in time, partly by the different proportions in which the elementary factors are combined. First the sense organ receives stimulation from without; upon this stimulation the organism reacts, the reaction taking its specific determination from the organ stimulated. A reflex of attention is excited, an act of discernment or consciousness of the difference of one group of neural units from the others which are present and crossing each other at the time—and the resultant is a sensation. The reaction of the sensitive organism is conditioned by the level of tension of the organism, and by its contents at the moment; these contents being all the residual effects of experience, together with all the neural processes still in action from past stimulations. Every fresh incident force which disturbs the existing balance of forces has a resultant sensation, emotion, or idea. This is the series—Sensation, Perception, Thought—which are thus seen to be merely stages in one process of neural agitation.

So far Mr. Lewes's exposition follows on the lines laid down by previous investigators, and especially by Professor Bain in his work, *The Emotions and the Will*. At this point comes in that which Mr. Lewes regards as original in his own view, and as

* *Problems of Life and Mind*. Third Series (continued). By George Henry Lewes. London: Trübner & Co.

necessary to complete the conception of the unity of all mental action. This is the doctrine that volition, external act, or movement, is only another point in the same series whose stages we have traced above. Mr. Lewes regards the presence of a motor element as necessary to every feeling whatever. This element varies, as the other elements of sensibility do, in the degree of its energy; it is sometimes dominant, is sometimes only unconsciously present. Muscle and motor nerves are necessary components of the mechanism of muscular sensation. Though the ingoing nerve which innervates the centre is distinguished from the outgoing, or motor, nerve, by being called sensitive, this is only in virtue of its dominant function. All nerve has common properties. Motor discharge is only the last stage in the series which began in impact, impression, or local excitation, and through all the stages of which one and the same sentient organism has been employed.

From what has been said it will be seen that in the view of mental association, as expounded by Mr. Lewes, the central operation between impression from without, with which the series commences, and motor discharge, with which the succession terminates, is intended to be resolved into the same elements of neuro-muscular action and reaction of which all the other stages of the series are composed. The facts designated by the terms Sense, Intelligence, Volition, are taken as different modes of manifestation of one and the same sentient organism, in each of which is found the triple process of stimulation, grouping, and motor-impulse. It is in the reduction of intelligence to a mode of sensibility that lies the strength, and also the novelty, of the exposition as given by Mr. Lewes. All past philosophy has assumed as fundamental the antithesis between thought and the sensational and emotional states of the soul. The first breach in the prevalent belief was, indeed, made centuries ago by the Nominalist logic, which cleared away the mist that had gathered round general terms by discovering these to be but shorthand marks for the purpose of recollecting, and speaking about, an indefinite number of individual things which resembled each other. Mr. Mill has, in our day and country, the credit of having applied this nominalism in a thoroughgoing way to the mystery of reasoning. All reasoning Mill declared to be from particulars to particulars; from the cases known to us to other cases unknown, passing through a universal, not as a part of the process, but as an abridged sign of the process of inference. The universal was not essential to the inference, but was only a sign that it was being made. But this doctrine, as stated by Mill, was a mere logical position: it rested on no foundation except that of its simplicity and clearness. No proof was, or could be, given of it; it was as if Mill had drawn it from his own inner consciousness.

The same phenomena of inference are approached by Mr. Lewes from another side, the physiological. What in nominalist logic was merely an opinion recommending itself by its simplicity is now shown to us as a physical fact. The sentient tremors are the only units of the psychical substance. As the sentient organism in virtue of its constitution can never be wholly passive, it cannot receive an impression without reacting. Each impression received combines with the residue of preceding impressions, and the groups thus formed constitute first sensations, then perceptions, then judgments. Or rather perception is a judgment, and every judgment is inference. Intelligence is the sum of the nervous adjustments which determine the secondary nervous adjustments on which actions depend; or, in terms of psychology, intelligence is the sum of organized experiences which determine conduct. The differentiation of intelligence from sense is the result of an ever-increasing complexity of the organism and its experiences. In the simple organisms the two are one, and motion follows on direct stimulation. As organisms rise in the scale of complexity, direct stimulations become compounded with conceptions formed out of the residua of previous direct stimulations. Ideas are formed which are representative of sensations. Intelligence is only the most comprehensive expression for the total of very numerous concrete processes. By thus classing the phenomena of intelligence under the general head of feeling, we restore the unity of mental phenomena, which had been put out of sight by the traditional dualism of current metaphysics.

Nothing can be more clear or thorough than this explanation of the whole circuit of mental processes. Nor is Mr. Lewes's exposition to be set aside by saying that it is physiological and not psychological. He offers it as an account of the whole of the phenomena which are commonly called phenomena of mind. But names do not make things. If neural tremors are the only psychical units, and all the operations of intelligence are only groupings and co-ordinations of these units, then the mental mystery is entirely resolved into a physical series of facts, obscure indeed, but still capable of experimental verification.

But if this satisfactory result has been arrived at, we must ask why does Mr. Lewes impair the complete triumph of physiology by keeping up the old nomenclature derived from the hypothesis of the existence of a spiritual substance called mind? To continue to speak of "mind" and "soul," of mental and psychical, as Mr. Lewes does, is only to perpetuate the exploded dualism of an obsolete metaphysics. One of his most daring appropriations of the old style to express something quite different from its original meaning is in his use of the word logic. Mr. Lewes speaks habitually of the "logic of feeling." He justifies this violent association of two opposites in one phrase by an etymology which is false, and by the expression "logic of events," which, whoever first coined it, has got itself adopted in common parlance. "Logic" is not "derived" from *legein*, to bind together, and "logic of events" is a highly-strained metaphor, permissible indeed in rhetorical writing, but still a metaphor, and not therefore qualified to bear the weight of a scientific system and to justify the identification of what in the superseded psychology were the opposite poles of mind—thought and emotion. Nor does Mr. Lewes help his new terminology by telling us that "in the language of the schools a judgment is said to have three *terms*, subject, predicate, and copula." It is true that "term" is used by newspaper writers to mean no more than "word." But it would be impossible to produce a single scholastic logician who had so far forgotten his Latin as to speak of the *copula* as a "term," and not to remember that "term" (*terminus*) is only applicable to the two ends of a longitudinal series. It would not be becoming to insist upon such minutiæ of expression if they had the appearance of being mere lapses of attention. But they are not so. This new use of "logic" is deliberately intended by the author, if not to substantiate, at least to cover and recommend, his position that the process of grouping by which two judgments are integrated in one conclusion is the same process as that by which present and past impressions are integrated in one sensation. As this unity of all psychical phenomena is the special doctrine of the modern science of mind, the discovery in virtue of which it can claim to have revolutionized psychology, it would surely have been better to have signalized it by an appropriate nomenclature, instead of letting it pass under names indissolubly associated with the old dual system in which thought was made the antithesis of feeling, the very system against which Mr. Lewes's whole book is a protest.

We must not omit to mention that, in connexion with the main thesis of the third and fourth Problems, there are many subordinate discussions in which Mr. Lewes's abounding knowledge and fertility of illustration are shown at their best, and which make the present volume, in spite of a certain want of method and arrangement, one of the most interesting to read in his whole series of "Problems." Such is the thorough investigation of the theories of the Muscular sense; and, again, the chapter in which he assigns the distinctive marks of sensation as produced by objective stimulation, and the reinstatement of that sensation after the object has been removed, a state for which he proposes the name of "after-sensation." Double sensation is illustrated by a collection of cases either supplied by the author's own experience or drawn from foreign medical journals little known in this country. The chapter on Images, in which the resemblance between sensation and image is dwelt upon, and the fact brought out that the organic conditions of production are the same in both, may be cited as instancing what was said above, that this volume, amid seeming disorder, possesses a higher unity obtained by its constantly impressing the continuity and uniformity of all psychical phenomena.

WAIT A YEAR.*

WHEN we have said that *Wait a Year* is a novel which cannot by any chance do any one any harm, we have, we fear, exhausted all the praise that we can honestly bestow. One of the characters to which the author introduces us begins, as we read, under the influence of the life on the Riviera, to drift from his moorings, to think lightly of the obligations of the Sabbath, to forget the parental instructions, to frequent Sunday receptions, and to indulge in other laxities. Whether among these laxities he took to novel-reading we are not told, but we hold it by no means impossible. He might, however, with a safe conscience have read *Wait a Year* on any Sabbath in the year. It is a book that we could honestly recommend for mothers' meetings, and for reading aloud to a sewing-class in a young ladies' selectest of schools. It is moral from first to last. Its high tone is not once marred by any ill-timed levity. It can be read not only without a smile, but even without the slightest temptation to mirth. It is as good as a sermon—and as bad too. The lesson that it teaches is admirably adapted to lead young people in the path of virtue, if only they can keep awake. The heroine is laborious, meek, and patient. She bears her trials with admirable fortitude, and she is rewarded by marrying a man who has 6,000*l.* a year, is the owner of an abbey, and moreover a Rector with a good living and sound evangelical views. She has a younger sister, who, though pretty enough, is idle, vain, and impatient, and therefore is very properly left at the end of the third volume without the most distant prospect of even a curate for her husband. There is a brother, the foolish and weak young man who frequents Sabbath receptions, and is led astray by the sinners at Nice. He dies of the effects of an attempt that he made on his own life, after losing his money in the gambling saloons at Monte Carlo. He might have recovered from the wound that he had given himself, but the poison of remorse consumed the little strength obtained by judicious nursing. On the other side there certainly is a set-off in the fact that the heroine's rival—a young lady by no means so good as she ought to be—marries a man who has also 6,000*l.* a year. This is, at first sight, somewhat discouraging for virtue; but the reader is comforted by reflecting that her husband had neither a rectory nor an abbey, was not sensible or refined, but was merely a *nouveau-riche* who had

* *Wait a Year.* By Harriette Bowra, Author of "Redlands," "Una, or the Early Marriage," &c. 3 vols. London: Sampson Low & Co. 1880.

made a large fortune in trade, and desired to dazzle his less fortunate neighbours. However, it might have been more prudent had not the author given him exactly the same number of thousands a year as she gave to the virtuous hero. We once used to find that the wealthy men in stories had all alike just 10,000*l.* a year. Are heroes coming down in the world, or has there been a general fall in values? Is virtue more easily satisfied, or will money buy more?

It is time, however, for us to turn from these general reflections and introduce our readers to our admirable heroine. When we first make her acquaintance it is at her father's breakfast-table in Hillesden Rectory. He, good man, was chipping his second egg. Let not the hasty reader draw rash conclusions as to the robust state of the Rector's health. He took, indeed, two eggs to his breakfast; but this fact, we believe, is only mentioned to give an air of life and reality to the scene. In like manner, we have the Rector's wife placidly sipping her tea, and then we come to the point when the Rector put aside his empty cup, cut open the cover of a letter which he received, and read it with satisfaction. He was not equally well pleased by another letter which was brought by the same post. From it he learnt that the patron of the living, the Rev. Warren Sinclair, called upon him to resign it, in accordance with the understanding on which he had been presented to it twelve years before. This is, the reader will admit, a discouraging introduction to a man whom we in a moment recognize as the good hero. That he should wish to turn a virtuous priest out of a comfortable living, in which he had faithfully done his duty, was anything but heroic or even clerical. But Mr. Sinclair was acting from a mistaken sense of duty, as he clearly saw when, by great good luck for his moral character, he tumbled into a crevasse on a glacier near Chamounix. He had hitherto lived the life of a rich bachelor, who was rendered too popular by the dinners served up by his first-rate cook. Nevertheless, he had "the better qualifiction (*sic*) of being honestly desirous to act up to his conscience, notwithstanding the lions in his path." He was a tender-hearted and a benevolent man, but up to his thirty-fifth year he had known nothing of those softer emotions, "which," in the author's words, "by adding the gentler qualities to mental power, often give the *fleuron* of beauty to manly strength." He had, however, spent a winter at Cannes, and there he had met a beauty of a very dangerous sort. Helen Lestocq had a radiant beauty which is at one time described as being a little Juno-like in character, and at another time as being imperial in its undimmed splendour. The blue eyes were brilliant, sparkling, lustrous, and laughing. They won the heart of the rich clerical bachelor, and, as she was poor and worldly, he was at once accepted. The reader, however, is not greatly disturbed by this engagement, which is formed almost at the very opening of the story. He has already made the acquaintance of Mona Moreton, the real and undoubted heroine, though the hero has not, and he has already seen, with that quick glance in which the practised novel-reader far surpasses the most match-making of mothers, that, in spite of engagements, it is she, and not Helen, who is to marry the virtuous but misguided Mr. Sinclair. Scarcely had the engagement been made when the lover, on hearing a sermon, is suddenly struck with remorse at the idle life he had hitherto led. He sees that it is his duty to begin to work, and therefore he gives Mr. Moreton notice to quit. Some time after he had escaped from the crevasse, he owned that he "had been brought up to value what may best be expressed by the word 'externalism'—that is, I was disposed," he said, "to give an exaggerated attention to the trappings and framework of religion." This disposition, no doubt, had greatly influenced him when he resolved to displace Mr. Moreton, who belonged to the opposite party in the Church. Having made his resolution to devote himself to parish work, he wrote to inform the worldly Helen. When she received the letter "she was presiding over her mother's breakfast"; in other words, she was sitting at a table with a coffeepot or a teapot, as the case might be, a milk-jug, and a sugar-basin in front of her. "If the purport of these few lines," the fond lover had written, "takes you entirely by surprise, I shall be obliged to reflect upon myself," &c. The lady was indeed taken by surprise. Passionate anger glittered in her eyes, which, if bright as steel, were now as hard, and she tore the paper in two. Her mother prevailed on her not to give up Mr. Sinclair altogether; but she resolved to show her displeasure by leaving his letter unanswered. At last, when he came to see her, she assured him that she must wait a year—hence the title of the story—before she would declare her intentions. For a whole twelvemonth he was not to see her, or even to write to her.

Meanwhile the good Mr. Moreton suddenly died, leaving his widow and children but very ill provided for. The heroine became a daily governess. The hero meanwhile had had his tumble into the glacier, and had, not unnaturally, been for a time affected by "cerebral agitation." During his recovery "a great revolution was going on in his mind; not only the hinges on which it turned, but the very foundations of principles he before considered solid were changed or changing." What it is, by the way, that turned on the hinges is not so clear as we could desire. It may have been the revolution, or it may have been the mind. Moreover, when the very foundations are changed, it would not seem to be of much importance what happened to a pair of hinges. The result, however, of the change of foundations and hinges was that, as soon as he was strong enough, he set off to enter upon the duties of his living. There he meets the heroine, who from hard work, anxiety, and the peevishness of her mother and sister, had got into a very sad state. She even faints in church during the service, and is carried into the vestry. The Rector, when he entered, "approached at once, without waiting to remove his canonicals." This most unclerical, but lover-like ardour on his part, fills the mind of the reader with the fullest convictions as to his own sagacity, in prophesying at the beginning of the story that they were made for each other. Another day she is caught in a storm, and takes refuge in the cottage of an old woman, who is confined to her bed by an attack of rheumatism. The Rector comes in, and insists on using the old woman's whole store of wood in lighting a fire to warm the heroine. He writes a note for his brougham to be sent, and asks her whether there is anything else which he should order. Thereupon follows a short dialogue which at once shows her amiability and his affability, and at the same time affords a fair specimen of the author's style of writing:—

"Anything else," he said, after reading what he had written.

"We have burnt all her wood, every bit of it; there will be none left to boil her kettle to-morrow morning."

Mr. Sinclair smiled, and added, "Send a basket of wood, and charge the coachman to keep it dry."

"Small wood also to light the fire," continued Mona; "a faggot would be difficult to transport."

"You know how to think for others," he observed, approvingly. "So whilst I am gone be kind enough to make a list of the dilapidations we have made of Mrs. Horwood's stores, and also of such articles as would be most acceptable to her. We have been housed and refreshed, and will pay the scot."

It must not be for one moment supposed from this conversation that the Rector was always a man of many words. He could be brief enough when the occasion arose. Thus we read that he was one day sitting in his study when the maid-servant announced that Mr. Edward Moreton had come to see him. "'Show him into the drawing-room,' was the laconic reply." Having thus guarded the good man from any groundless reflection that might be made on his character, we must return to the heroine. She is engaged before long by the Rector's sister as governess to her daughter, and accompanies them to the Riviera. There among the gay idlers of Nice, who, oblivious of dust or damage, trailed their long skirts over the gravelled walks, in the midst of feathers and silken sheen she meets her rival. She discovers that this bad woman is so forgetful of the good man to whom she is engaged, that she has fallen in love with his flighty half-brother. "Marriage," says our author, "comes next to death in the seriousness of its character, and to err in the choice of a wife is misery, the die thrown being irremediable in its results." However, the bad Helen cared nothing about the irremediableness of the throw of a die, and, rather than marry a poor man, was prepared to hold Mr. Sinclair to his engagement. The unhappy Rector, true to his promise, though he had long repented of it, goes so far as even to write to an upholsterer in London about furnishing his rectory for the reception of his bride. By the greatest good luck, however, he and the good heroine, a very short time before the day fixed for his marriage, both get nearly burnt to death in a fire, which broke out in a Swiss hotel. He is wounded, and she raves. In her delirium she lets out some secrets of importance. At the same time, the half-brother arrives. Time has been gained, and the ill-fated engagement is soon broken through. Before long the heroine leaves off raving, and coming back to her senses finds that the hero is free to offer her his hand. They have nothing to do but to repair to the British Embassy in Paris, where they are happily married. A year later the bad heroine also repairs to the same Embassy, and is likewise married; but, we undertake to say, by no means happily. However, the story is brought to a very creditable conclusion, seeing that each of the brides has, as we have said, a husband who is worth 6,000*l.* a year.

ITALY AND HER INVADERS.*

ENGLISH historians have given singularly little attention to that interesting and difficult period which lies between Constantine and Charlemagne, the period of the death of the old Roman Empire and civilization, and the birth of the new nations of modern Europe. It is a century since Gibbon dealt with it in a way which might have been expected to stimulate many others to take up and work out in their details those great movements which he sketched in outlines. Yet while since his time Germany has done much, and France something, English scholars have scarcely touched a subject full of life, variety, and novelty. Perhaps they may have feared comparison with a predecessor whom they could not hope to rival, or may have thought he had left little to be said that could charm the general public for whom, rather than for the limited circle of scholars, English historians are sometimes accused of chiefly writing. If this has been their notion, it is an ill-grounded one. Gibbon, full and splendid as his treatment of these centuries is, has by no means exhausted them. Many new sources of information have been opened up since his time; and the topics he handled are capable of being set in a very different light from that which he threw upon them.

Mr. Hodgkin's book is an excellent proof of this, and an encouraging testimony to the growing interest which English students are now beginning to take in the borderland of ancient and modern history. It goes over the same ground as Gibbon, but it is not in

* *Italy and her Invaders*, 376-476. By Thomas Hodgkin, Fellow of University College, London. Oxford: Clarendon Press. 1880.

the least like Gibbon in manner or style, and even in substance is less like him than any one who knows how thoroughly Gibbon worked up his materials could have expected. The idea of the book is to describe the process by which the old government and civilization of Italy were destroyed, and the foundations laid for the new development of her mediæval life. This Mr. Hodgkin proposes to do by writing the history, not only of the Italians from the time when the first Northern invaders appeared among them in the beginning of the fifth century, but also of each tribe of those invaders—West Goths, Huns, Vandals, East Goths, Lombards. In the two volumes that lie before us he has completed the first half of his task, having carried the narrative down to the fall of the Western Empire in 476 A.D., and the rule of Odoacer, which followed. The conception is a fine one, worthy of the long and serious study which Mr. Hodgkin has evidently given to it. It is, however, extremely difficult to carry out, not only because the data for many parts of the subject are very meagre, but also because the state and fortunes of Italy are so intermixed with that of other parts of the Roman Empire that her historian is inevitably drawn into a general narrative of the events of the time. Mr. Hodgkin has not succeeded in overcoming this difficulty. He has been driven to depart pretty widely from his original scheme, and has really given us not so much a history of Italy and the Teutonic nations that invaded her, as a series of pictures from the fourth and fifth centuries. They are no doubt connected by a thread of narrative, but they constitute not so much a regular history as a group of studies, some descriptive, some philosophical, on the great men and great movements of the time. First we have a sketch of the dynasty of Valentinian I.; then an account of the early wanderings of the Goths and of their great invasion of Thrace; then a full description of the reign of Theodosius I., followed by an abstract of the Notitia Imperii; then a very detailed history of the reign of Honorius, in which the careers of Stilicho and Alaric are vigorously handled. On the death of Honorius, the fortunes of his sister Galla Placidia are made the centre of the narrative, which digresses into a series of notes on the buildings and legends of Ravenna. The second volume opens with a sketch of the earlier history of the Huns, followed by a very detailed account, taken from Priscus, of the famous embassy of Maximin and Priscus to the Court of Attila, and a description of Attila's invasions of Gaul and Northern Italy. From Huns we are led to Vandals; but this tribe, for whose earlier career there remain indeed hardly any trustworthy data, is treated in a rather summary way. Next comes a long and characteristic digression upon the life and writings of Sidonius Apollinaris. Mr. Hodgkin justifies the eighty pages which he expends on the literary bishop by remarking that his correspondence is our best authority for the inner life, social and intellectual, of the period. We so far accept the justification as to admit the value of the matter which this digression gives us, but though the book gains in interest, it suffers in consecutiveness. Four chapters are then given to the last eight Emperors of the West, another to Odoacer, and a concluding one to an inquiry into and reflections on the causes which produced the fall of the Roman Empire.

The book is not only illustrated by coloured engravings of some of the Ravenna mosaics; but admirably equipped with a series of maps showing the political changes of the fourth and fifth centuries, and endeavouring to localize the original seats of the Barbarian tribes. There is perhaps no point in which our new books of history show so decided an improvement on those of the last century as in the number and execution of the maps they contain.

Besides the disproportionate length of its digressions, the plan of the treatise is defective in not keeping clearly enough before the reader the general succession of events through the Roman world, and especially in the eastern half of the Empire. Every now and then Mr. Hodgkin gives us a reference to the wars, the palace intrigues, and the violent ecclesiastical struggles which threatened or distracted the Court of Constantinople. But it would be difficult to get from his pages a connected view of the march of events in the Empire as a whole. Nor does he tell us nearly enough about Italy and her inhabitants. The materials are no doubt scanty; yet by putting together all that exist some more detailed picture might surely have been presented of the economic and social, as well as the political condition, of the Italian population. Especially ought he to have dwelt more fully on the ecclesiastical movements of the time. He knows of course how the bishops of Rome were building up their power, how paganism was vanishing, how a new religious world was coming into being, but he seldom refers to such matters, and refers even to Pope Leo the Great only when he has to deal with the invasion of Attila. Even for the history of the Teutonic nations he has not used all the books which one might have expected to see referred to. To take one instance only, Dahn's admirable treatise on "The Kings of the Germans" is not, so far as we remember, once quoted by him. And consequently the notices of the government, laws, and organization of the German invaders are meagre and unsatisfying.

Despite these and some smaller blemishes (such as the use of modern local names in a way likely to perplex the ordinary reader), the book is one of great and uncommon merits, worthy both of the long labour which has evidently been spent on it, and of the University which has published it for an author who, as he tells us in the preface, is not himself an Oxford man. There is a freshness and heartiness about it which makes it pleasant reading from the first page to the last. The author has lived so long among the men of whom he writes that they have become quite real and living to him, and his interest communicates itself to his readers. Now and then he gives us an admirably forcible and vivid study, whether of a man's character, or of a particular event. Such, for instance, is the description of the great battle at the River Frigidus (between Trieste and Laybach) by which Theodosius won Italy, a description which has all the appearance of having been written on the spot. His style is always simple, lively, graphic; and if his treatment, and the reflections or illustrations which he throws in, become occasionally somewhat more familiar than the last generation would have thought compatible with the dignity of history, this is, after all, an error on the right side, an error which one is disposed to praise when the subject is so remote and little known that a dry and pragmatic handling of it is more than usually certain to repel most people. The poetical and dramatic aspect of history is always present to his mind, yet he avoids the common faults of those who make history popular by dramatizing it; he is neither inaccurate in details nor rhetorical in language. He has a real gift for telling a story, never missing those little touches in which the effect of a story lies, and can bring out the humour of a situation in a way which is all the better because it is quiet. Such faults as the book has—and the defective construction is the chief of these—seem to us to be faults of inexperience; while the merits are great and genuine, likely to ripen with further study and the practice of composition. From one frequent defect of a new writer he is free. He has not taken up this subject in ignorance of history before and history after, but shows by his illustrations and parallels—far-fetched as we may sometimes think them—that he has been an earnest student of history as a whole.

The book covers so wide a field that one cannot do more than indicate two or three of the points in which its views are likely to be most serviceable to the general reader. In the first place, it brings out very clearly the Teutonization, so to speak, which was going on in the armies of the Roman Empire concurrently with the decline of the native population, and the steps by which the military leaders, from the time of Stilicho onwards, stepped into the place of the emperors, and made the nominal sovereign little better than a puppet in their hands. It is a remarkable fact (though our author, touching so slightly on the Eastern Empire, is not led to discuss it) that the symptoms of the same process which appeared at Constantinople cease after a time, and ultimately leave the Eastern Empire defended by a national army under national leaders. Secondly, Mr. Hodgkin grasps adequately and explains fully the cardinal fact that, when the Western Empire came to its end in A.D. 476, nobody living at the time realized that it had done so or regarded that year as forming an era. There had been so many interregna in Italy, the emperor himself, exalted as his place remained, had come to be practically so unimportant, the notion of the continuity of the Empire was so completely maintained by the existence of a Roman monarch at Constantinople, that it did not occur to people that the cessation of the Imperial title at Rome made any considerable difference. No doubt the strange condition into which the outlying provinces, like Gaul and Spain, had fallen, contributed to this. No one ceased to consider them Roman, though in point of fact they ceased to send taxes to the capital or receive governors from her. Just so, no one was startled by the inconsistency of an Empire surviving in Italy without a resident emperor. The time was out of joint altogether, facts and theory not agreeing with one another, but having got into this disagreement so gradually that no one could quite tell how the change had come, nor what was its significance. If the interruption of the Imperial succession in Italy had coincided with such a great event as the capture of Rome by Alaric, people would have felt its importance. But it coincided with nothing more than the rise into predominance of one general in the Imperial service, the Herulian Odoacer, and the fall of another, the Illyrian Orestes. Mr. Hodgkin has illustrated this well in a passage we may quote:—

> Looking back as we now do over an interval of fourteen centuries at Odovakar's position in history, we find it impossible to assign him a place exclusively in the old order of things, or exclusively in the new, to say whether he was in truth the successor of Aetius and Ricimer, or the forerunner of the Kings of Italy, Pepin, Boso, and Victor Emmanuel. And if this be our doubt now, we may be sure that at least an equal doubt existed in the minds of his contemporaries, not lessened by the fact that there was always for the space of at least one generation, a chance that the old order of things might after all be restored, and that the rule of the Teuton king might turn out to have been only an interregnum between two emperors, such as had occurred more than once under the ascendancy of Ricimer. At the time of the Embassy to Zeno there were still in the world three men who had worn the Imperial purple and coined money as Emperors of Rome. We have reason to believe that one at least of these deposed Emperors lived through the reign of Odovakar, perhaps to a much later period. Let us transfer now to the subjects of the new Teutonic king some of the feelings of unsettlement and of half acquiescence in change with which a large part of the English nation regarded the Protestant Succession during the reigns of Anne and the First George, or the feelings with which we ourselves have witnessed the establishment of a new French Republic, with three hostile dynasties sitting as angry watchers by its cradle: and we shall a little understand the mental attitude, partly of perplexity, partly of listless unconcern which contemporary statesmen assumed towards an event which seems to us so momentous as the fall of the Western Empire.
>
> For in truth the facts of the final struggle had little in them to attract the attention of bystanders. The sack of Rome by Alaric in 410 sent a shudder through the whole civilized world, and the echo of her dirge was heard even from the caves of Bethlehem. The nations held their breath with affright when in 452 Attila wreaked his terrible revenge upon Aquileia. In comparison with these events, what was the short flurry of the citizens of Pavia, or the death of Paulus in the pinewood by

Ravenna? Indisputably we ourselves have witnessed catastrophes of far greater dramatic completeness than this, far better calculated, according to the old definition of tragedy, "to purify the emotions by means of Pity and Terror." It is not a storm, or an earthquake, or a fire, this end of the Roman rule over Italy; it is more like the gentle fluttering down to earth of the last leaf from a withered tree.

And yet the event of 476 was in its indirect consequences a revolution which affected most powerfully the life of every inhabitant of mediæval and even of modern Europe. For by it the political centre of gravity was changed from the Palatine to the Lateran, and the Bishop of Rome, now beyond comparison the most important person of Roman descent left in Italy, was irresistibly invited to mount the throne and to wrap himself in the purple of the vanished Augustus.

Finally, our author has indicated the position of the Christian Church in the Roman Empire much more sympathetically, and therefore more instructively, than Gibbon has done, or indeed, with his habitually scornful attitude, could have done. He has not perhaps worked its history with sufficient fulness into the political history which he relates. But he makes his readers feel its presence and its action both as helping to save and as helping to destroy the Empire, strengthening the moral influence of the Roman society as much as it diminished the material strength of its armies. In this last point Mr. Hodgkin perhaps overstates his case. Even without the rise of the new faith, the fall of the Empire was certain. Monkery did not withdraw from the armies of the West a sufficiently large military element to have made a practical difference, nor had persecution raged sufficiently, unless perhaps against the Donatists in Africa, to alienate any part of the provincial population; while, without the bond of Christianity, it might have been impossible to organize that league of Romans and Germans which arrested the march of Attila.

It is long since we have come across a book more likely to make history popular, by true and honest methods, than Mr. Hodgkin's. We wish him success in completing it, hoping that while he gains in symmetry and closeness of treatment, he will preserve the simplicity and earnestness which have won our regard.

IN PASTURES GREEN.*

IT seems to be rather the fashion at present for novelists to republish collections of short stories which have, presumably, seen previous service in magazines. Possibly it may put some money in the pockets of the authors, but assuredly it rarely adds to their reputation. Brilliancy and brevity, so far as our experience goes, are very seldom to be found in combination; and, looking at romance-writing from the professional point of view, there are reasons, as we have remarked before, why these short stories should be failures. It needs no ordinary gifts to convey definite conceptions of character in a few cursory touches; while the writer who has got a really good notion in his brain is not inclined to dispose of it summarily in a severely Procrustean process. But we do not think that Mr. Gibbon need reproach himself with any wasteful expenditure of material that he might have used to more profitable purpose. The six stories that are bound together under the deceptive title on the back of the volume, which only applies to the first of them, are as slight as may be; nor do we see that a practised novelist should have any difficulty in multiplying work of the kind to any extent. The ideas, where there are any, are commonplace in the extreme; and the "plots" are such as would naturally suggest themselves to any Oriental storyteller or Italian improvvisatore with the smallest aptitude for his profession. There is scarcely an attempt at the suggestion of character; there is a want of finish and some slovenliness of style, while perhaps we should be grateful for the occasional abruptness of their beginnings, as it prepares us for a "lame and impotent" *dénouement*. If we appear to speak of unpretentious work with undue severity, Mr. Gibbon has only himself to thank for it. Four out of the six of these unconsidered trifles of his might have passed muster fairly well in the pages of a magazine, though they would scarcely have been remarked as "a feature" even in a second-rate number. But when he implies that they deserve the honours of republication in a volume, we take leave to join issue with him decidedly, although undoubtedly they may hope for a certain circulation at a season when unfortunate people in wet weather by the sea are thrown back upon the resources of the local libraries.

Though "In Pastures Green" is one of the stories that has an end without an ending, it is nevertheless the best of the series. We know that Mr. Gibbon can write a charming country prose idyl—it is not very long ago that we had an opportunity of praising his *Queen of the Meadow*—and in green fields and in a picturesque rural parish he finds himself on his own favourite ground. We have pretty touches of rural description, beginning with Milly Arnold, the heroine, as she stands between her father's church and quaint old parsonage, framed in an arch of honeysuckle and red berries. Milly is the vicar's eldest daughter, the mistress of his household and of his youthful family; a simple, sweet, and unaffected girl, with no particular story, so far as we are given to understand. Yet, apparently, there is more of mystery in her lot than we are inclined or intended to suspect; for while she had "for seven years filled the place of their lost mother" to her little brothers and sisters, we are informed, at the same time, that the youngest of the children was only aged four. How we are to reconcile those conflicting statements is a difficulty which fairly staggers us. The solution might have given an original interest to the tale; but then, unfortunately, Mr. Gibbon vouchsafes no solution at all. Milly, like so many of Mr. Trollope's maidens, has a couple of rival admirers; and the social position and domestic relations of one of them make us surmise that the parish she graced with her presence must have been primitive indeed. We should have thought that the vicar's pretty daughter might have looked higher than young Eben Tyler, stalwart, good-humoured, and well-to-do as he For Eben's father, as he had made himself, could hardly have made much of a fortune by farming; the worthy woman the elder Eben espoused had been in service in her younger days; and the niece who lives with them, and whom they design for Eben, had always, as a matter of course, done the hardest work on the farm, even to rubbing down the horses. Yet when Eben makes his proposal Milly practically accepts him, though he stupidly takes her "No" for an absolute refusal; and the vicar would gladly have approved the connexion, though he will put no constraint on his daughter's inclinations. Milly's other lover, or rather dangler, has some sanguine notions of his own as to life and the manner of succeeding in it. Being the son of an eminent barrister and Q.C., Mr. Montague Lewis "had a vague idea that some day he would take to work in earnest—not in the plodding way of his father, but in a grand way. He would go into Parliament and obtain some appointment which would develop his genius and conduct him straight to the woolsack." But he breaks down in the solitary case in the English courts which had been confided to him through his father's influence, and goes to India and to the Indian Bar, where he actually gets on and makes money. Though this Mr. Lewis had been smitten by Milly's charms, she did not seriously reciprocate his admiration; and his attentions to her weighed for nothing at all when she rejected poor Eben Tyler's proposals. She refuses Eben simply for the reason she assigns—that she could be ill-spared from her duties at the parsonage. The amorous Eben being matter of fact enough to take her dutiful and doubtful answer as final, in due course marries his cousin Sarah, who can at all events be relied upon to rub down his horse when he brings the animal in over-heated. He pays a tribute to the memory of his youthful romance by naming a little girl Milly after Miss Arnold, who is her godmother. Miss Arnold resigns herself to revolve in her monotonous sphere of usefulness at the parsonage, while living on the most friendly terms with the Tyler family at the farm; and Mr. Lewis, after a fifteen years' absence, comes back from India with a liver complaint, to feel some languid awakenings of his old admiration, and to condescend to be present at the birthday *fête* given in honour of Miss Arnold's godchild.

"Cancelled Engagements" is a game at cross-purposes, which ends, through singularly lucky coincidences, far better than the gentleman who relates it deserves. Intoxicated with wine, warmth, waltzing, and a fascinating face, he breathes a proposal which is promptly accepted. Next morning he awakes, very likely with a headache, and certainly in the pains of tardy repentance. How he had known so little of Miss Julia Harmond is hard to comprehend, seeing that her failings were conspicuous enough, and that he had apparently been a friend of her father and her family. At all events, a more tender and intimate acquaintance with her fully confirms his morning's misgivings. He finds her vulgar and commonplace; and her letters are even more disenchanting than her conversation. They are badly written and ill spelled, while "the matter was of the most insignificant nature"; and this is the more remarkable as Miss Harmond's father is an exceptionally cultivated and intelligent man. Besides the lover finds out that his betrothed had been deceiving him, in maligning her own half-sister. Myra, whom Julia had misrepresented as old, plain, and ill-tempered, proves to be young, beautiful, and bewitching. The lengthening chain the victim drags begins to gall him more intolerably, when matters are more unpleasantly complicated by his slipping into love with the elder sister. Sympathetic hearts are quick to understand each other; but of course Myra, who is a paragon of self-abnegation and perfection, does her utmost to stifle her responsive passion. By sustained effort she has suppressed all signs of it, when relief comes from an unexpected quarter. A gentleman who is understood to have shamefully jilted her turns up in the bosom of the Harmond family, professing to be in a position to explain his conduct. He finds Myra resolved to let bygones be bygones, and by the magic of the kindly name of brother she defines at once their future relations. Mr. Marby accepts the fraternal position, with something more than *empressement*; in fact, he takes immediate steps to make the title of affection a reality. He conveniently transfers his attachment to Julia, who is willing to meet him more than half way. And it may be imagined with what courtesy the narrator accepts Mr. Marby's apologies for relieving him of the woman he had rashly committed himself to. The sisters are married simultaneously to their respective lovers, the curtain falling on the close of the drama amid general family jubilations.

The last three stories are Scotch; and "Daft Tam" is the most sensational of the six. It is a tale of love, lunacy, and murder, wrought out upon the old melodramatic lines. The introduction, which strikes us as irrelevant, is in the style of one of Dickens's collections of Christmas novelettes. The narrator and some carriagefuls of companions in misfortune are snowed up in a railway cutting in the "Howe of the Mearns," where they have the good fortune to find refuge in a village inn, with an entertaining host, and a well-furnished larder. They had a famous opera singer in their society, who cheered them with songs from her répertoire

* *In Pastures Green; and other Stories.* By Charles Gibbon, Author of "Queen of the Meadow," &c. London: Chatto & Windus. 1880.

after supper, her voice having happily suffered nothing from the exposure. Then their landlord volunteers to cap their contributions of anecdotes with his story of "Daft Tam," which is meant to point a moral. Tam had been a gentleman, who, having made a miserable marriage, had taken to drink to drown his sorrows. He meets his wife and murders her in a fit of frenzy, and suspicion falls on an unlucky young man, who is found standing over the bed of the murdered woman with a blood-stained razor in his hand. The presumptive evidence is overwhelming, and the youth has not a word to say for himself. He would have suffered undoubtedly on the strength of false appearances, but his mother comes to prove that he is a confirmed somnambulist, while the landlord discovers a razor-case and footprints which bring home the crime to the actual culprit. "Dominie Barclay" is another case of unhappy love and seduction, which ends in a marriage seemingly even more ill-matched than that of Eben Tyler and Milly Arnold would have been, though the author leaves us to understand that it holds out fair prospects of happiness. The title of "Paction wi' the Deil" sounds like broad Lowland Scotch; but the story is told in a dialect of broken Celtic, somewhat more exaggerated than that with which Mr. Black has familiarized us in his Hebridean romances; and we candidly own that we found it such crabbed reading that the interest failed to carry us further than the middle. As a rule, when we set ourselves to the reviewing of fiction, we are grateful for anything that is shorter than the ordinary three-volume novel. But we have enjoyed three-volume novels by Mr. Gibbon; and we are very sorry that we cannot honestly say as much for this haphazard collection of fugitive fancies.

GREEN'S HISTORY OF THE ENGLISH PEOPLE.*

MR. GREEN'S *History of the English People* has now reached its conclusion. With the battle of Waterloo and the restoration of Louis XVIII. the author arrives at the limit which he has assigned to himself. He leaves untouched that great chapter of English history which, beginning with the settlements of Vienna and Paris, closes at the outbreak of the Crimean war. It is thus not very far into "Modern England" that he carries us; but he could hardly have found later on so good a wind-up of his tale as the battle of Waterloo, unless indeed following the example of Charles Knight, he had gone on to the abolition of the Corn Laws, an event which at the time seemed to enthusiastic Liberals to be almost equivalent to the opening of the gates of Eden. But the present generation, agriculturally depressed, wavering in the faith of political economy, and almost as far off Eden as ever, is not so easily stirred to enthusiasm about the Corn Law struggle, and for it the fall of Napoleon makes a more effective conclusion of the long drama of history.

Taking a general survey of the four volumes, we should be inclined to say that Mr. Green is at his best as an historian of mediæval times. A disciple of Mr. Freeman and Canon Stubbs, he yet brings to his task some powers peculiar to himself. Canon Stubbs is the anatomist of history; it is his part to lay bare to us the hidden organization of mediæval life. Mr. Freeman's work is that of the sculptor; while Mr. Green holds rather the place of the painter. And even as painting is more popular, and appeals to a wider range of sympathies, than sculpture, so does Mr. Green's work attract a wider range of readers than that of Mr. Freeman. Clearness, strength, majesty, definite form, truth of outline, and purity of art belong to the sculptor-historian; his disciple gives us colour, movement, light and shadow, sunshine and haze—not always without the painter's tricks of effect, the exaggeration here, the intentional vagueness there. But, however the effect may be produced, the picture as a whole is true; and few men have done as much as Mr. Green to make mediæval history real and interesting to the popular mind. Nor would we confine his powers to mediæval history alone. In any age his strongly sympathetic imagination makes him at home in dealing with great religious movements, such as the Reformation and Puritanism. Of his treatment of periods such as these we have already in earlier notices expressed our admiration.

Our readers will probably infer that we consider this last volume hardly on a level with its predecessors. No man can be equally in sympathy with all centuries, and, on the whole, the eighteenth and early nineteenth centuries form the period with which Mr. Green has least in common. The present volume, notwithstanding its many and great merits, reads somewhat like task-work when compared with the preceding ones. The very style is less suitable to the eighteenth century than to earlier ones. We feel that the eighteenth century should be treated in the manner of Gibbon; the historian should powder his hair and put on lace ruffles before sitting down to his desk, and should never forget that "enthusiasm" to the eighteenth-century mind meant something distinctly foolish, if not wicked. Mr. Green's style is emphatically that of the later nineteenth century. He is "passionate," to use his own word in his own sense, earnest, emotional. He has a weakness for the expressions of the modern novelist. "It was the dim, feverish sense of the drift of these efforts"—of Spain to restrict trade with her colonies—"that embittered every hour the struggle of English traders with the Spaniards in the Southern seas." This is the poetic way of looking at the contentions of rival traders, and the rows between British smugglers and Spanish coastguardsmen. We think of Captain Jenkins and his like trying to run cargoes past the guarda-costas, and now and then getting an ear torn off in the process, and wonder whether they were ever troubled with "dim, feverish" presentiments, except perhaps after a drinking-bout. We are told how the nation was always getting involved in war, "passionate as it was for peace"—an expression which seems suitable to some "Passionate Pilgrim," or Euphuistic lover, rather than to prosaic Britons grumbling at war-taxes. So the England of 1790 is described as a nation "whose passionate love of personal liberty was only equalled by its passionate abhorrence of bloodshed in civil strife." One is not prepared for so much "passion" after having been told in the very same sentence that it was a nation "whose temper was sober." Our objections may be fanciful; but we own that to us the robust eighteenth century seems to demand a robuster style. At any rate, we may ask for something clearer than this:—"Pitt was the grandson of a wealthy Governor of Madras, who had entered Parliament in 1735, as member for one of his father's pocket-boroughs." Nothing but a previous knowledge of the dates will assure the reader that it was Pitt, and not his grandfather, who entered Parliament in 1735. Mr. Green's style is one of his greatest charms; but he should be on his guard against affectation and carelessness, sometimes in construction, sometimes in his use of figurative language, as when, speaking of Addison's writings, he observes that "the strife of politics loses something of its fictitious earnestness as the humourist views it from the standpoint of a lady's patches." Ariel or his fellow-sylphs might indeed find standing-ground on Belinda's patches, but it could be done by no being more substantial.

Though we think Mr. Green is on the whole strongest in earlier periods of history, still it is only by a little that this volume comes short of its predecessors. In the chapter headed "The Fall of the Stuarts" Mr. Green has the inevitable disadvantage of travelling over the ground occupied by Macaulay. Although the influence of that writer can be plainly traced, Mr. Green's style and method of treatment are so entirely his own that the narrative does not lack freshness. In his vivid account of that strange tragicomedy, the deathbed of Charles II.—for both tragedy and comedy meet in the ghastly incongruities of the scene—he deviates from Macaulay in adopting Burnet's story that the dying King accepted Ken's absolution *after* he had been secretly reconciled to the Church of Rome. Macaulay and Lingard have preferred the account, less discreditable to Charles, that Ken's absolution was given and accepted before the secret interview with Huddleston. We may pass rapidly over the rest of this chapter, which ends with the death of Anne, because the period is familiar to all who have read aught of history. At the accession of the House of Hanover Mr. Green pauses to explain how the effect of the Revolution was to remove England from her isolated position as regarded Continental politics, and how it came about that she found herself the especial guardian of the "Balance of Power." The passage is too long to quote entire—here and elsewhere Mr. Green's thoughts would often gain by condensation—but we give a few extracts from the latter portion, in which he traces the moral effect of the policy of the Georgian statesmen:—

> Diplomacy spent its ingenuity in countless choppings and changings of the smaller territories about the Mediterranean and elsewhere; but till the rise of Prussia under Frederick the Great it secured Europe as a whole from any world-wide struggle. Nor was this maintenance of European peace all the gain which the attitude of England brought with it. The stubborn policy of the Georgian statesman has left its mark on our policy ever since. In struggling for peace and for the sanctity of treaties, even though the struggle was one of selfish interest, England took a ply which she has never wholly lost. Warlike and imperious as is her national temper, she has never been able to free herself from a sense that her business in the world is to seek peace alike for herself and for the nations about her, and that the best security for peace lies in her recognition, amidst whatever difficulties and seductions, of the force of international engagements and the sanctity of treaties. The sentiment has no doubt been deepened by other convictions, by convictions of at once a higher and a lower stamp, by a growing sense of the value of peace to an industrial nation, as by a growing sense of the moral evil and destructiveness of war. But strong as is the influence of both these sentiments on the peace-loving temper of the English people, that temper itself sprang from another source. It sprang from the sense of responsibility for the peace of the world, as a necessary condition of tranquillity and freedom at home, which grew into life with the earlier years of the eighteenth century.

Every reader of English history must often have been struck by the amount of Tory feeling in a nation which yet was proving its essential Whiggism by upholding William and the House of Hanover. As he notes one outbreak of popular Toryism after another, he is tempted to think that the Revolution settlement must in some unexplained manner have been imposed on the nation against its will. Mr. Green gives the solution of the problem. The nation desired the Revolution, but had not desired all the consequences it entailed.

> In making the revolution it had meant to vindicate English freedom and English Protestantism from the attacks of the Crown. But it had never meant to bring about any radical change in the system under which the Crown had governed England or under which the Church had been supreme over English religion. The England of the Revolution was little less Tory in feeling than the England of the Restoration; it had no dislike whatever to a large exercise of administrative power by the sovereign, while it was stubbornly averse from Nonconformity or the toleration of Nonconformity. . . . And yet every Englishman knew that from the moment of the Revolution the whole system of government had not been Tory but Whig. . . . . Every year saw the Crown more helpless, and the Church becoming as helpless as the Crown. The country hated a standing army, and the standing army existed in spite of its hate; it revolted against debt

* *History of the English People.* By John Richard Green, M.A., Honorary Fellow of Jesus College, Oxford. Vol. 4—The Revolution (1683-1760), Modern England (1760-1815). London: Macmillan & Co. 1880.

and taxation, and taxes and debt grew heavier and heavier in the teeth of its revolt. Its prejudice against Nonconformists remained as fanatical as ever, and yet Nonconformists worshipped in their chapels and served as aldermen or mayors with perfect security.

"Revolt" is perhaps too strong a word to apply to petty outbreaks of discontent against new and heavy taxation—even Walpole's Excise scheme did not produce a revolt, though, no doubt, it might have done so if it had been persevered in. There was, Mr. Green goes on to point out, only one course—the recall of the Stuarts—open to the malcontent Tory. But then this course, though it would have brought about much that he wanted, would also have brought about much that he emphatically did not want. "Tory as he might be, he was in no humour to sacrifice English freedom and English religion to his Toryism, and to recall the Stuarts was to sacrifice both." In the conscientious impracticability of the Stuart exiles the House of Hanover found its security.

The account of the Peninsular war, and indeed of the whole struggle against Napoleon, is full of spirit, though we think that he might amend the statement that "the fruits of the victory" of Talavera "were lost by a sudden appearance of Soult on the English line of advance." Coming as this does almost immediately after the statement that Wellesley was pushing on Madrid, the reader would naturally infer that Soult was between the English and Madrid, whereas he was in reality between them and Portugal. He was in their rear till Wellesley turned to meet him. The phrase that the French army was "forced" "to surrender in the Convention of Cintra" is also misleading, as most people would understand from the term *surrender* that the French gave themselves up as prisoners of war, instead of merely evacuating the country. The late M. Lanfrey would have contested the justice of the view here taken of Napoleon's great scheme for the invasion of England. Twice Mr. Green praises its skill—"a skilfully combined plan," "the great armament whose assembly in the Channel he had so skilfully planned." Under Lanfrey's hostile criticisms, the plan appears indeed brilliant, magnificent, grandiose, but not skilful. Napoleon himself afterwards owned that he was no master of maritime warfare:—"Il y a dans ce métier une spécialité, une technicité qui arrêtait toutes mes conceptions." The merits of the plan are however matter of opinion; what actually came of it is matter of fact; and here Mr. Green's account will not bear examination:—

> Admiral Villeneuve, uniting the Spanish ships with his own squadron from Toulon, drew Nelson in pursuit to the West Indies, and then suddenly returning to Cadiz, hastened to form a junction with the French squadron at Brest and to crush the English fleet in the Channel. But a headlong pursuit brought Nelson up with him ere the manœuvre was complete, and the two fleets met on the 21st of October, 1805, off Cape Trafalgar.

Every child who has read Southey's *Life of Nelson* knows that the English hero's "headlong pursuit" did not bring him up with Villeneuve. Sir Robert Calder fell in with, and engaged, the combined fleet off Cape Finisterre on the 22nd July, while Nelson was vainly looking for it between Cape St. Vincent and Gibraltar. Baffled in his chase, he went home and struck his flag; but, on learning that Villeneuve had entered Cadiz, he again offered his services, and went out to fall at Trafalgar. As for Villeneuve, it was his fault or his misfortune, according as we take the view of Thiers or of Lanfrey, that he never did hasten to form the junction with Ganteaume at Brest. The engagement with Calder did not prevent him from reaching his destination, Ferrol, where he remained more than a week for repairs. When, having left Ferrol, irresolute and despairing, he turned his back on Brest and made for Cadiz, there was an end of the great plan, as Napoleon's rage against the unhappy admiral sufficiently attests. When Villeneuve left Cadiz on the 20th of October, it was with orders to operate in the Mediterranean. An English writer might fairly be expected to have mastered the incidents of one of the most famous chapters in English history. One might also expect him to be acquainted with the constitution of the Imperial Parliament. Yet Mr. Green tells us in p. 338, that, according to the terms of the Union with Ireland, "twenty-eight temporal with four spiritual peers, chosen for each Parliament by their fellows, took their seats in the House of Lords." It is the Scotch, not the Irish, representative peers, who are chosen for each Parliament.

The printing of "Lord John" for Lord *George* Sackville, in the account of the battle of Minden, is a minor matter; and the carelessness which has allowed five sentences on the effects of the Methodist revival, first occurring at p. 149, to be repeated at p. 273, only damages Mr. Green himself, by marring two passages which are otherwise excellent. But it is inexcusable when he writes of William III. that "He dissolved the Parliament [of 1689], and issued in his own name a general pardon for all political offences under the title of an Act of Grace. Bitterly as both measures were resented by the Whigs, the result of the elections proved that William had only expressed the general temper of the nation." An enemy would be tempted to suggest that Mr. Green must have got up the subject from an entry in the Index to Macaulay's History. "Act of Grace . . . . Was the act of William III. alone." It is true that in the text Macaulay says:—"The Act of Grace the nation owed to William alone"; but, as he had just described the etiquette of passing an Act of Grace through Parliament, and the reception of this particular Act by the new Parliament of 1690, and had remarked that William had not ventured to submit such an Act to the preceding Parliament, he might reasonably think that nobody could be misled by a rhetorical phrase attributing all the merit to his hero. We presume that Mr. Green has satisfactory authority for putting the number of rebels hanged at the Bloody Assizes at three hundred and fifty, but Macaulay is content with thirty less. Dealing with a later rebellion, the "Forty-five," Mr. Green says that in England fifty of Charles Edward's followers were hanged; whereas Sir Walter Scott, who was likely to be accurate in such a matter, reckons up over seventy. We note a slight exaggeration in the following statement:—"The Prince [Charles Edward] was now"—after his success at Preston Pans—"at the head of six thousand men; but all were still Highlanders, for the people of the Lowlands held aloof from his standard, and it was with the utmost difficulty that he could induce them to follow him to the south." Though it appears that Highlanders formed the greater part even of the so-called Lowland regiments in the Pretender's force, it is surely going too far to say that "all" were Highlanders. Referring to Mr. Burton's *History of Scotland*, we find among those who joined after Preston Pans, Lord Pitsligo with his following of a hundred and twenty men from the eastern Lowlands of Aberdeenshire, besides the Earl of Airlie's son with six hundred men, "who, though collected on the mountainous Braes of Angus, must be considered as in some measure of Lowland origin." Further on, Mr. Green says, "Manchester was looked on as the most Jacobite of English towns, but all the aid it gave was an illumination and two thousand pounds." The money, we believe, was only forthcoming under somewhat strong pressure; but it should be recorded to the credit of the Jacobite zeal of the town that it gave about a hundred and eighty recruits, who formed the main part of the "Manchester regiment," of which nine officers—among them James Dawson of ballad celebrity—fell victims to the executioner. Mr. Green does indeed observe that "from Carlisle to Derby" the Pretender "had been joined by hardly two hundred men"; but he does not connect these recruits with Manchester. In recounting the incidents of the Wilkes struggle Mr. Green is, we think, not quite accurate in saying that on Wilkes's re-election, after his incapacity had been declared, the House "again expelled him." It took the line of treating his election as null and void.

It will be seen that Mr. Green's characteristic faults and merits remain much as they were. He still chooses to throw upon his readers some part of the labour of revising his work. But he will not the less have readers, because he has the power of helping them to a better understanding of history. One may have been told the same story by fifty previous writers, perhaps have been told it with more accuracy; and yet somehow Mr. Green makes it clearer and more intelligible than it has been before. We must add that, though he will not give us references—in this last volume he has not condescended even to such vague and general references as in the earlier ones—he has given us a full index, for which we are thankful.

MINOR NOTICES.

MR. BRANDER MATTHEWS (1), an American writer, whose name is already known to English readers interested in American literature and American newspapers, has brought out an attractive and careful little volume on the Paris theatres, ranging from the Grand Opera to the "theatres of farce and extravaganza," and even to the café-concerts. Mr. Brander Matthews has studied his theatrical Paris carefully, and his book is gracefully dedicated to M. Coquelin in memory of some pleasant conversations held in the distinguished actor's dressing-room. There are few things as to which, with regard at least to its finer shades, there is more difference of opinion among students and experts than acting, and especially French acting. Mr. Matthews has a catholic as well as a cultivated taste, and his writing is interesting both for those who may agree with him entirely, and for those who may find certain points on which to join issue with him. With regard to his appreciation of the admirable player whose name is prefixed to his book, the difference of opinion can, if it exists, be only one of degree. There will probably be no doubt as to the justice of the high praise which he gives to M. Coquelin's performance of, for instance, Septmonts in *L'Etranger*, and of a wide range of parts in Molière; and in discussing another performance with which it might be more possible to find fault, he has dwelt on the one scene in which the actor's powers were seen at their best. We have called attention in the first place to Mr. Matthews's criticism of M. Coquelin, because that actor's name stands on the title-page of the book; but it must not be supposed that the writer has given anything which could possibly be construed into undue prominence to M. Coquelin's performances. M. Coquelin occupies with other actors, chief among them MM. Got and Delaunay, the first rank at the Théâtre Français, and to these others Mr. Matthews gives the same careful and appreciative consideration which he has given to M. Coquelin. When he comes to the actresses of the Comédie Française we find somewhat more (though "that's not much") to disagree with, and it seems that Mr. Matthews has been too apt to take as infallible whatever M. Sarcey in his varying moods has chosen to utter. M. Sarcey writes beautiful French, and has no doubt seen, considered, and pronounced upon a vast number of plays; but his criticism is wanting in fineness, and is not always consistent or delivered with the impassiveness which an oracle ought to possess. Of the other Paris theatres, and theatrical or semi-theatrical entertainments, Mr. Matthews discourses fluently and agreeably, although his style is,

(1) *The Theatres of Paris.* By J. Brander Matthews. With Illustrations. London: Sampson Low & Co.

to an English reader at any rate, open to some objections, and although he has made not unnaturally a few odd slips. Perhaps the oddest of his opinions are to be found expressed or implied in the brief "Conclusion" which comes at the end of the book.

Professor Meiklejohn's edition of *Hamlet* (2), which, being intended for the use of school boys and girls, is naturally Bowdlerized, is well printed and got up. In a "general notice" prefixed to the play we learn something as to the editor's intentions which we could hardly have become aware of from mere consideration of the text and notes. "The first purpose in this elaborate annotation," writes the editor, "is of course the full working out of Shakspeare's meaning. The editor has in all circumstances taken as much pains with this as if he had been making out the difficult and obscure terms of a will in which he himself was personally interested; and he submits that this thorough excavation of the meaning of a really profound thinker is one of the very best kinds of training that a boy or girl can receive at school." All this sounds fine enough, if it savours a little of self-confident pedantry; and it may be worth while to turn to some specimens of Mr. Meiklejohn's "thorough excavation of the meaning" of Shakspeare. If there is no particular good, there is also no particular harm in Mr. Meiklejohn's "elaborate annotation," until we come to line 115 of act i. scene 1. "Gibber, speak inarticulately. Cog., *Gibberish*." What is the schoolboy or schoolgirl to infer from this but that the *g* is sounded alike in both words, and that gibberish means, which it does not at any rate exclusively, inarticulate speech? Seven lines later on we have "Prologue—A theatrical term. S. is rather fond of these technical terms of the theatre. Thus we have the phrases, *Speak, 'tis your cue; get us properties* (= dresses)." The editor would have done better to leave out the bracketed passage, which shows that whatever "S." may have been, he at least is rather ignorant of "these technical terms of the theatre." On line 160 of the same scene, "And then they say no spirit can walk abroad," Mr. Meiklejohn makes this note, "Spirit—A monosyllable," without telling us whether he thinks it should be made "sprit," or "spirt," or "sperr't." In opposition to this somewhat bald and vague annotation, we find the editor, when he comes to the first speech of the next scene, calling the attention of his unfortunate schoolboys and schoolgirls to this German-commentator-like and irritating note of Coleridge's:—"In the King's speech observe the set and pedantically antithetic form of the sentences when touching that which galled the heels of conscience—the strain of undignified rhetoric—and yet in what follows concerning the public weal, a certain appropriate majesty." Of line 11 of the same speech, "With an auspicious and a dropping eye," Mr. Meiklejohn says that "an" is "probably pronounced *one*," and on line 13, "In equal scale weighing delight and dole," he is pleased to observe that "here the formality and antithesis verge closely on the ridiculous." Without following the editor's "elaborate annotation" line by line and scene by scene, we may point to a few others among his comments. The meaning of "gape" in "Though hell itself should gape," he assumes to be "roar at me," and suggests that the word bears the same meaning in "Some men there are love not a gaping pig," in *The Merchant of Venice*. A pig which roared at persons whom it disliked would certainly be "a fearful wild-fowl." In act ii. Polonius says of Hamlet, "I'll board him presently." On this Mr. Meiklejohn makes the following astounding note for his schoolboys and schoolgirls, "When Polonius is not pedantic he is coarse." This is a kind of thing calculated indeed to puzzle the will. In his treatment of Hamlet's speech to Osric in act v. sc. 2, concerning Laertes, Mr. Meiklejohn is not much worse, if he is no better, than other heavy and plodding commentators. He belongs to that class which is incapable of conceiving Hamlet's meeting Osric's affected phrases with more learned, more elaborate, and more exquisite nonsense, and he comes to the stupid conclusion, often come to before, that "the passage is almost unintelligible and probably corrupt," being kind enough to say, however, that "yaw" in "and yet but yaw neither in respect of his quick sail" stands for "would yaw." This is surely the very ecstasy of pedantry. One more glaring instance of Mr. Meiklejohn's notions of perception and taste will bring to an end our unpleasant task of pointing out the faults in one of the very worst editions of a great work that we have ever been unhappy enough to see. On the words "that from a shelf the precious diadem stole, and put it in his pocket" Mr. Meiklejohn makes this "elaborate annotation." "From a shelf,—Like an area sneak." People who wish their children or pupils to care for Shakspeare had better keep Mr. Meiklejohn's *Hamlet* out of their way. Such unnecessary and unwise stuff as he has prepared with the pretentious names of "elaborate annotation" and "excavation" (whatever that may mean) can do nothing but produce a distaste for the subject which it affects to make clear. Mr. Meiklejohn's efforts are more fitted for the New Shakspeare Society than for the use of schools.

The popularity of the profession of letters among those who want remunerative employment is largely due to the ease with which it seems to be entered; but the thorough-paced literary man, who looks back upon years of struggle, disappointment, hard work, and moderate gains, knows that in reality the profession is like all others in requiring, besides ordinary aptitude and application, the investment of capital, the service of an apprenticeship, and the slow, toilsome acquirement of the secrets of trade, so to speak, which form the conditions of success in all other callings. The disappointments of great authors are enumerated in a pretty little book before us entitled *Journals and Journalism* (3) in which Mr. John Oldcastle offers himself as a guide for literary beginners. Thackeray, we are told, failed repeatedly, and his contributions were at first refused by all the leading magazines. Mr. Carlyle, "after being 'edited' out of all recognition in the *Edinburgh Review*, was finally rejected as a contributor altogether." Of another very eminent living author we read that his greatest work was "utterly, unconditionally, and irrevocably rejected" by every publisher. Of another we are told that one of his first year's receipts amounted to 12*l.* 5*s.* 7½*d.*, and another to 20*l.* 2*s.* 6*d.* Motley's *Dutch Republics* was at least once "declined with thanks"; and Lingard, Brougham, Jeffrey, and even George Eliot, are cited as examples of what seems to be the almost universal rule with young writers. Every one has heard of the weary round of publishers to whom Charlotte Brontë offered *Jane Eyre* in succession without success. Sterne, Fielding, Hawthorne, and, greater than all, Milton, were no exceptions. A power of bearing disappointment must, therefore, almost as much as a power of literary composition, be assigned as the first qualification of a would-be author. It is a question how far books like this really benefit beginners. Experience cannot be acquired by rote. The young writer who is not deterred by the prospect of disappointment at first may learn something, perhaps, from the interesting pages of Mr. Oldcastle; but the most useful parts are those in which he insists on the necessity of clear and legible handwriting and instructs the student in the art of correcting proofs. His dictionary of the periodical press is tolerably complete, and the particulars he gives are trustworthy, so far as we have been able to test them. The whole volume is pleasant reading, although we fail to find anything very new or original in it. The form of the book, the print, the toned paper, and the binding are worthy of praise, and will be highly appreciated by persons addicted to bibliomania. The text is illustrated with facsimiles of the autographs of eminent journalists.

The adventures of Wandering Will (4) have a certain resemblance to those of many boys whose fortunes have been told for other boys by Captain Mayne Reid, Mr. Kingston, and other writers whose names are dear to boy students of fiction. But while the writer of *Wandering Will* is more careful as to the minuteness of his incidents than the authors just referred to, he wants their vigour and freshness. At the same time "Will's" story is fluent and not unpleasing.

Mr. Black's manual of sick nursing (5) aims at disseminating the principles of his subject among the masses. His purpose is emphatically not to make people think that they can safely undertake the treatment of disease without skilled advice, but rather to show them what they may safely do or attempt in the inevitable absence of a doctor. This purpose is well illustrated by the excellent remarks on "gossip" which occur early in the book, and which point out the dangers of advice from friends who think that they know all the patient's symptoms and can prescribe for them. Mr. Black's unassailable position in this matter is supported by a capital story quoted from a French writer.

Another treatise on the same subject (6) issued from the *Bazaar* office, contains some generally safe directions as to the methods to be adopted in various forms of sickness. This is perhaps less useful than Mr. Black's Manual in that it trenches more directly upon the doctor's province.

Miss de Fonblanque has written a lively account of the time which she passed in company with some friends in seeing as much of Iceland (7) as they could see in the time at their disposal. They found, as other travellers in Iceland have found, that they had certain inconveniences to put up with, the oddest and not the most agreeable of which was being compelled, with the sanction and welcome of the presiding Lutheran priest, to convert a church into a kind of inn. They thought too that they had a right to complain of their chief guide's conduct in assuming an equality with them and delegating their orders to the people under him. This, as the writer states that the guide was a son of a literary man of importance, does not strike us as an intolerable infliction; and people who have journeyed in company with, and under the care of, Swiss guides will probably be somewhat astonished at anyone wishing to treat a guide as a mere menial. During their journey to the Geysers, which of course they visited, Miss de Fonblanque and her companions were surprised and at first delighted by hearing some music which they took to be performed in their special honour. It is a little strange that not one of the party should have been aware that the national air of Iceland is identical with our own. Every one who writes of Icelandic experiences is expected as a matter of course to say something about the Geysers, and what Miss de Fonblanque says about them has the merit, which is not too common, of avoiding affectation either of fine writing or of display of knowledge. For scientific information the writer refers her readers to the article "Geysers" in the *Encyclopædia Britannica*, and her account of what she saw

at the springs is clear and simple. From one of them she got a scare, the nature of which we shall leave our readers to discover in her pages. To what we have said of the attractions of her little book we must add a word of praise for the singular accuracy of the proper names which occur in it.

A new edition has been issued of the late Bishop Stanley's *Familiar History of Birds* (8). This has been revised by a practical and experienced ornithologist, who has made the alterations rendered necessary by the advance of knowledge, but has carefully avoided any superfluous tampering with the text.

Mr. Masson has brought out the first of a series of volumes devoted to "Episodes from French History" (9). It is compiled from Mr. Black's translation of M. Guizot's History and contains notes, a bibliographical index, and a genealogical table.

A seventh edition, edited, brought up to date and enlarged by Mr. Watts, has been issued of Taylor's *Bee-Keeper's Manual* (10). This is the first edition that has appeared without the author's own supervision, and since his death "the entire aspect of the subject treated of is changed." Important facts have been discovered which, in Taylor's days, were unknown, and the editor has been compelled, in order to give these facts their proper weight, to add largely to what Taylor wrote. The work is sure to be welcomed by all who care for its interesting subject.

A second and revised edition has appeared of Mr. McCalmont's *Parliamentary Poll-Book from* 1832 *to* 1880 (11).

Mr. Stanford has issued a fourth edition of Mr. Loftie's well-known *Round About London*, (12) and while speaking of this we may mention also that we have from the same publisher second editions of the Tourists' Guides for the West Riding and for Sussex, written respectively by Mr. Bevan and Mr. Chambers, a third edition of Mr. Bevan's handbook to Kent, and a second of Mr. Worth's South Devon.

A second and improved edition has appeared of Mr. Sandlands's (13) treatise on the management of the voice in public speaking.

The thirteenth part of Mr. Dalziel's *British Dogs* (14) includes spaniels, pugs, and Pomeranians, and breaks off disappointingly early in an account of that most attractive and interesting creature, the poodle.

From the same office we have, together with other publications of a somewhat similar kind, the Third Part of Mr. Fish's *Bulbs and Bulb Culture* (15).

A short time ago the first volume of a new and complete edition of Mr. Bret Harte's works (16) was noticed at some length in these columns. The second volume of the series, containing "Earlier Papers," "Spanish and American Legends," "Tales of the Argonauts, &c.," gives us matter which is more familiar, but not for that reason less attractive. Most, indeed, we may say all, of the stories in this volume are old favourites with Mr. Bret Harte's readers. One, "Mr. Thompson's Prodigal," has a special interest in being the germ of the drama "Two Men of Sandy Bar," which appeared in the first volume.

The eighteenth volume of Charles Kingsley's works (17) is made up of sanitary and social essays, which have of course lost the interest which they had at the moment of their publication, but which are still interesting, both in themselves and as an illustration of the aspect in the past of questions some of which are still unsettled, and are likely to remain so for some time.

Captain Parker's *Sketch of the Kafir and Zulu Wars* (18) is unaffected, vigorous, and interesting. In many cases he has the advantage of speaking from practical experience, and in none has he spared any pains to make his narrative full and accurate.

A second edition has appeared of Mr. Bright's fascinating little book, *A Year in a Lancashire Garden* (19).

It seems but a short time ago since we noticed the annual appearance of the invaluable *Dod's Parliamentary Companion* (20). The new Parliament has naturally called for a second edition, with a good many more alterations than are to be found in most second editions.

(8) *A Familiar History of Birds.* By the late Edward Stanley, D.D., F.R.S., Lord Bishop of Norwich. Second Edition. London: Longmans & Co.

(9) *Episodes of French History.—Charlemagne and the Carlovingians.* Edited from M. Guizot's History of France, by Gustave Masson. London: Sampson Low & Co.

(10) *The Bee-Keeper's Manual; or, the Honey Bee and its Management and Preservation.* By the late Henry Taylor. Seventh Edition, modernized and very greatly enlarged by Alfred Watts. London: Groombridge & Sons.

(11) *The Parliamentary Poll-Book of all Elections from the passing of the first Reform Act in* 1832 *to July* 1880. Revised and greatly enlarged Edition. By F. H. McCalmont. London: Stanford. Nottingham: Forman & Sons.

(12) Tourist Guides. *Round About London.* By the Rev. William J. Loftie. With a Map and Copious Index. Fourth edition. London: Stanford.

(13) *The Voice in Public Speaking.* By J. P. Sandlands, M.A. Second Edition. London: Hodder & Stoughton.

(14) *British Dogs.* Illustrated with numerous portraits of leading dogs of the day. By Hugh Dalziel ("Corsincon"), assisted by eminent fanciers. Part XIII. London: "Bazaar" Office.

(15) *Bulbs and Bulb Culture.* By D. T. Fish. Part III. London: "Bazaar" Office.

(16) *The Complete Works of Bret Harte.* Collected and Revised by the Author. Vol. II. London: Chatto & Windus.

(17) *The Works of Charles Kingsley.* Vol. XVIII. Sanitary and Social Lectures and Essays. London: Macmillan & Co.

(18) *A Sketch of the Kafir and Zulu Wars.* By Captain Henry Hallam Parker, Military Secretary to H. E. Sir Bartle Frere. With Maps. London: C. Kegan Paul & Co.

(19) *A Year in a Lancashire Garden.* By Henry A. Bright. Second Edition. London: Macmillan & Co.

(20) *Dod's Parliamentary Companion.* Forty-Eighth Year. Second Edition. New Parliament. London: Whitaker & Co.

CONTENTS OF No. 1,293, AUGUST 7, 1880:

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

MALVERN COLLEGE.
The NEXT TERM will begin on Monday, September 20.

VICTORIA COLLEGE, JERSEY.—The NEXT TERM will begin on Wednesday, September 8.

LEAMINGTON COLLEGE.—ENTRANCE SCHOLARSHIP EXAMINATION, on September 14 and 15.—Address, Rev. Dr. WOOD, College, Leamington; or, after August 1, Craigside, Felixstowe, Ipswich.

S. ANDREW'S COLLEGE, CHARDSTOCK, RE-OPENS September 10.—Apply to SECRETARY.

SOMERSETSHIRE COLLEGE, BATH.—The NEXT TERM commences Saturday, September 18. For Prospectus and other information apply to the HEAD-MASTER.

EXETER SCHOOL.
Chairman of Governors The Lord Bishop of EXETER.
Head-Master—The Rev. EDWARD HARRIS, M.A., late Classical Assistant-Master at Clifton College.
The New School (including Chemical Laboratory) built from the designs of Mr. W. Butterfield, is now in use.
Tuition Fee .... £15 to £21, according to age.
Boarding Fee .... £50 to £60, " "
There are valuable Scholarships tenable at the School. Also Exhibitions to the Universities and other places of higher education of the aggregate value of £500 per annum.
The Next Term will begin on Thursday, September 16.
Apply to the Clerks, Messrs. DAW & SON, 13 Bedford Circus, Exeter; or to the HEAD-MASTER, at the School.

THE ISLE OF WIGHT COLLEGE.
Head-Master—Rev. F. R. PENTREATH, D.D.
The NEXT TERM commences on Friday, September 17, at Ten A.M., when all Boys are expected to be present.
The system of Education is that of the leading Public Schools.
Boarders are received by the Head-Master at the College, and also by Two of the Assistant-Masters at Lothian House.
Fees for Board and Tuition amount to £80 5s. per annum.
Prospectuses can be obtained from the HEAD-MASTER, and also from J. W. FARDELL, Esq., Hon. Sec., Cambrian House, Ryde.

DOVER COLLEGE.—Board, £46 6s. Tuition, from Thirteen to Eighteen Guineas. The NEXT TERM will commence on September 15. Apply to the Rev. W. BELL, M.A., the Head Master; or W. KNOCKER, Esq., the Honorary Secretary.

PREPARATION for the UNIVERSITIES, for the Naval, Military, East Indian, and Civil Services, for the Preliminary Examinations for the Legal and Medical Professions, and for Mercantile and other pursuits. *Principal*—The Rev. E. B. SLATER, M.A., late Fellow of St. John's College, Cambridge. *Vice-Principal*—W. A. HASLAM, M.A., Sixth Wrangler and Fellow of St. John's College, Cambridge. The Michaelmas Term commences on September 9. Particulars as to Cadetships, Exhibitions, Scholarships, Prizes, Medals, Terms, successes of former Pupils, &c., may be obtained of the Secretary.
By order of the Council, ALFRED EAMES, *Secretary*.
Royal Naval School, New Cross, S.E., August 1880.

WOOLWICH, SANDHURST, MILITIA QUALIFYING.—MORGAN JENKINS, M.A. (Wrangler), assisted by an able staff of Graduates in First-class Honours, prepares PUPILS for the above. Has passed Ten out of thirteen sent up at different times for Woolwich, two in the recent Examination, one Second in July 1877; numerous Pupils for Sandhurst, and Seven out of eight Lieutenants of Militia.—50 Cornwall Road, Westbourne Park, W.

MILITARY COLLEGE, CLAPHAM, Surrey. *Principal*—Rev. Dr. WRIGLEY, M.A., Wrangler, formerly Professor of Mathematics, R.I.M.C., Addiscombe. NEXT TERM September 4.—For Prospectus apply at 67 High Street, Clapham, or Mr. E. STANFORD, 55 Charing Cross.

HAMPTON GRAMMAR SCHOOL, Middlesex. Founded 1556.—The NEW SCHOOL, built with strict regard to sanitary principles and all modern requirements, is NOW OPEN for BOARDERS and DAY SCHOLARS. The site is one of the highest and most beautiful in the Thames valley. Extensive playground, gravel soil, pure and bracing air. Excellent boating and bathing; swimming is taught. The full Public School Classical and Mathematical Course, with modern languages, natural science, drawing, &c. Preparation for Competitive and other Examinations and for mercantile pursuits.—For Prospectus apply to Rev. G. F. HEATHER, Hampton-on-Thames.

CHARTERHOUSE SCHOLARSHIPS.—The 1st 1879, and 4th 1880, were Pupils of the GRANGE SCHOOL, EWELL, Surrey. The Next Term commences September 14. Terms very moderate. References to Parents. *Principal*—C. D. ALEXANDER, M.A., Trinity College, Cambridge.

STRATFORD-ON-AVON.—TRINITY COLLEGE SCHOOL. The Warden, RICHARD F. CURRY, M.A., is assisted by Seven Resident Graduate Masters—Two being specially for Modern Languages. Classical and Modern Sides. Junior Department for Young Boys. Large Playgrounds, Fives Courts, Gymnasium, &c. &c. Terms 50 and 60 Guineas.—Apply to the WARDEN.

BOURNEMOUTH.—CHELTENHAM HOUSE (facing the Sea).—J. WILLIAM WILLIAMSON, M.A., Oxford, receives a few BACKWARD or DELICATE BOYS, under Fourteen, for thorough grounding. Terms moderate.

A. M. HEATHCOTE, B.A., Oriel Coll., Oxford, prepares BOYS between Seven and Fourteen for the Public Schools. Vacancies in the Autumn. Terms, £135 or £150.—Address, Woolley Green, near Romsey.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

FOLKESTONE.—MR. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A., in honours, and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. All Candidates successful at the last Sandhurst Preliminary. Fourth place taken in the recent Woolwich Competition.

LAUSANNE, SWITZERLAND.—Reputed for Education and Instruction.—Classical, Industrial Schools about £2 per year. Private Schools, £8 to £16. Homes for Pupils. Boarding Schools for Young Ladies and Boys from £50. English and Presbyterian Churches.—Apply to Bureau de Renseignements, la Grotte, 10, Lausanne.

SPA, BELGIUM.—A limited number of PUPILS have every facility for acquiring a thorough knowledge of modern languages, and of preparing for Public Examinations. High class references. Terms 70 to 80 Guineas, according to age. The English Principal will be in London in September to take back Pupils.—Address, W. and L., care of Messrs. Orellana, Collis, & Cuffe, 33A George Street, Hanover Square, W.

EDUCATION in GERMANY.—ONE VACANCY, where Four Pupils are successfully prepared for the Army, Civil Service or Commerce. Thorough French and German (within eighteen months). Refined English home. References (to Parents of Pupils) given and required. Prospectuses should be inspected.—Address, Dr. SAUSE, M.A., Government Examiner, Cologne.

GERMAN SCHOOL in FRANCE.—Professor HIRSCH, of NANCY, late of Cannstatt, will be at the HOLBORN VIADUCT HOTEL, from the [illegible]h to the 12th September. NEXT TERM begins September 15.

INDIAN and HOME CIVIL T.S., COOPER'S HILL, and the ARMY.—Mr. CROOKE is prepared to receive applications for NEXT TERM. There will be a Special Class for the Sept. Sandhurst "Preliminary."—Address, Westbourne Place, Eaton Square, S.W.

TOURS, FRANCE.—Rev. C. DOWMAN, LL.B., receives PUPILS for Woolwich, Sandhurst, Line *vid* Militia, and for General Education. Great individual attention. Very successful.—Address, Beau Séjour.

HEATHFIELD, ERLEIGH (near READING).—Mr. F. FABIAN BRACKENBURY, M.A., educates BOYS from the age of Seven to Twelve.
Mrs. FABIAN BRACKENBURY, a Daughter of the Rev. J. W. Hawtrey, Aldin House, Slough, takes special and personal care of the health and comfort of the Boys.
This Preparatory School is particularly intended to meet cases where parents do not wish to place their Boys under the charge of a Governess at home, or to send their Boys who are too old for the nursery direct to a School where they will mix with Boys much older than themselves.
Heathfield stands high, in six acres of land, on gravelly soil, in a very healthy locality, and is easily accessible from Reading (G.W.R.) and Erleigh (S.W.R.) Stations. The Parish Church is within a few minutes' walk of the School. Special attention is given to Elementary Education. The next School term begins on Tuesday, September 14. Terms £105 per annum.

FAIRFIELD, HORNSEY (near London).—Mr. LANCELOT WALTON, B.A., St. John's Coll. Oxford, receives a limited number of PUPILS, between Eight and Fourteen, to prepare for the Public Schools. Vacancies in the Autumn. For terms address as above.

carefully DY of great experience.—Address, Mrs. CARMICHAEL, Belmont House, Blackheath, Kent.

A LADY wishes to RECOMMEND the SCHOOL [illegible] her Two Daughters have finished their education. Sixteen Pupils received, [illegible] daughters of gentlemen of position. House large; situation healthy, and near London. The Educational advantages are great, and the health and comfort of the Pupils considered. Good home for delicate or backward Girls. Terms from 120 Guineas.—For particulars, apply to Mrs. HALDANE, Clatto, Cupar-Fife, N.B.

BAR EXAMINATION and LONDON LL.B.—A BARRISTER (LL.B., B.A., London Honours) receives TWO PUPILS into his Chambers, to prepare for the above Examinations. Past Pupils have obtained Honours both at the 1st and 2nd (LL.B. and Scholarships) at the Inns of Court Examinations. Terms, Six Months, 50 Guineas; Twelve Months, 100 Guineas.—Address, LL.B., 1 St. Stephen's Church Villas, Uxbridge Road.

A YOUNG LADY, the Daughter of a German Professor and of an English Lady, educated in Germany and France, speaking three Languages without any accent, who has attended the Stuttgart Conservatoire and sings well, desires an Engagement to Young Ladies, above Fifteen, as GOVERNESS or COMPANION. Best references.—For particulars apply to Miss M., care of Professor Hirsch, Nancy, France. The young Lady will be in London in September.

A MEDICAL GENTLEMAN, accustomed to travel, is desirous of travelling as MEDICAL ATTENDANT or COMPANION.—Address, M.D., care of Messrs. H. S. King & Co., 45 Pall Mall, London, S.W.

EDINBURGH.—A LADY, of artistic tastes, wishes to find a HOME with another Lady, or in a small family in or near Edinburgh. A separate Sitting-room indispensable, and no other boarders. Terms about £100 per annum. References required. Address, Miss DUFF, Hovingham, York.

CONSOLS *versus* GROUND RENTS.—Consols pay 3 per Cent. Freehold Ground Rents are equally safe, pay from 4 to 4½, and constantly increase in value. Descriptive Paper gratis, of Messrs. GEORGE BEKEN & Co., Ground Rent Agents, 80 London Wall.

ENGLAND to AUSTRALIA in FORTY DAYS.
ORIENT LINE.
The following Royal Mail Steam Ships, belonging to the ORIENT and PACIFIC STEAM NAVIGATION COMPANIES, are despatched every FORTNIGHT for ADELAIDE (Semaphore), MELBOURNE, and SYDNEY direct, taking Passengers at through rates to all the principal ports in Australia, Tasmania, and New Zealand.

	Tons.	H.P.		Tons.	H.P.
ACONCAGUA	4,107	600	LIGURIA	4,666	750

No. 1,295, Vol. 50. August 21, 1880. [Registered for Transmission abroad.] Price 6d.

IRELAND.

MR. FORSTER'S manly denunciation of the shameful language used by an Irish member of the name of DILLON gives superfluous proof that he at least has no sympathy with treason, robbery, and murder. The encouragement by a member of Parliament of assassination and of rebellion is assuredly not due to the rejection of the Disturbance Bill. The agitators who urge the tenant-farmers to withhold payment of rent would care nothing for temporary suspension of processes of eviction. One of them at a late meeting on the borders of Cork and Kerry boasted that the farmers had last year saved four millions by following the recommendation that they should pay either what they considered a fair rent, or no rent if the tender was refused. They were now exhorted to pay no rent in any case during the present year. The same or another orator, commenting on a cry raised by the audience of "shoot the landlords," hypocritically protested against personal violence, unless indeed the landlord with the aid of the sheriff and the police attempted to rob the tenants, or, in other words, to recover his rent. In that case they were urged to fight in defence of their property, which has become their own by the simple method of refusal to pay their debts. The peasants of France had, as one of the speakers apocryphally asserted, offered their landlords before the Revolution a fair compromise; but it was refused, and they gave the landlords their just due, a rope at every crossing. Supporters of the Disturbance Bill can scarcely affect to believe that the Land League would have acquiesced in the payment of rent and arrears after a suspension of eighteen months. The Bill, if it had been passed, would have been represented as an acknowledgment by the Legislature that the right of the landowner to his rent was contingent on favourable circumstances.

Mr. FORSTER'S sudden departure for Ireland will have produced an impression that the state of affairs is extremely serious. Neither violent speeches nor isolated agrarian outrages could have induced a Chief Secretary, with the concurrence of his colleagues, to take a course which must necessarily cause general and vague alarm. It may be presumed that Mr. FORSTER'S visit to Ireland will be short, as in a few days his presence will be required in the House of Commons to defend the Irish Estimates, which some of the Home Rule members threaten to oppose. It will be a fresh proof of a kind of audacity which has nothing to do with courage, if Mr. PARNELL'S followers, in pursuance of their threat, propose that the constabulary shall not be employed in protection of process-servers employed by landlords. The House of Commons is not likely to listen to any proposal of the kind, but the ringleaders of the faction may perhaps take the opportunity of renewing the obstructive practices which have been suspended during the present Session. It is possible that Mr. FORSTER may bring back with him information of a condition of affairs which, if it is disclosed, may reduce even Irish agitators to silence. There appears to be no doubt that the agitation of the Land League is in some places assuming the form of Fenianism. The robbery of firearms from the ship *Juno*, though it had insignificant results, illustrates the daring and the policy of the conspirators. It is also certain that in some districts the disaffected peasantry are providing themselves with arms received from the United States, or, in some instances, purchased through the almost incredible carelessness of the authorities at sales of old Government stores. The periodical recrudescence of sedition is one of the most notorious peculiarities of Irish history. Short intervals of tranquillity are always followed by increased violence of language on the part of demagogues; and then isolated acts of violence are followed or accompanied by attempts at resistance to the Government. The prudish regard of statesmen for the ordinary rules of the Constitution is fully appreciated by the disturbers of the peace. Successive Ministers fear to encounter the cant of Parliamentary commonplace by demanding, except under strong pressure, the extraordinary powers which might enable them to deal with conspiracy and anarchy. Interference with the possession of deadly weapons by would-be rebels and murderers is described, even by Ministers who have the courage to demand necessary powers from Parliament, as an extraordinary and anomalous violation of liberty. Two or three years ago Mr. GLADSTONE was shocked by an Act of the Indian Government which placed restrictions on the importation of arms. Democratic Governments are less squeamish in guarding the community from danger. The Cape Government not unreasonably justifies the disarmament of the native population by the statement that they have no game to shoot, that they never shoot at marks, and that they can therefore only want guns to kill their peaceful neighbours. Mr. GLADSTONE explained that the people of India required guns to shoot various animals, and especially serpents. Wolves were exterminated in Ireland many years ago, and since the days of St. PATRICK there have been no serpents to kill.

Mr. FORSTER and his colleagues perhaps by this time regret that they allowed the Peace Preservation Act to expire. It is indeed possible that the late Government, if it had remained in office, might have tried the same means of courting popularity; but the Ministers who have actually incurred an unnecessary risk are responsible for the consequences of their policy. As soon as they assumed office they were in a hurry to redeem at the cost of the country the pledges which they had unnecessarily given in Opposition. Their partisans of course quoted in their defence CAVOUR'S hackneyed saying that any one can govern with a state of siege; but there was no state of siege in Ireland which, under the Peace Preservation Act, enjoyed a liberty or license which would excite the surprise of Continental administrators. There is a wide difference between restriction on the possession of deadly weapons and liability to trial by drumhead court-martial. The Peace Preservation Act, as it was modified by the late Government, neither interfered with the convenience of peaceable subjects nor in any way restrained their enjoyment of liberty. The protection to which they are entitled has been less effectually afforded since the Act was, for the benefit of the Ministers, allowed to expire. The virtual murder of Mr. BOYD and his son would probably not have been perpetrated if the Government had not given unnecessary facilities for the acquisition of arms. To suit the particular case CAVOUR'S speech must be altered by the insertion of a negative. Any statesman can fail to govern with or without a state of siege. The security of life and property, which is the main object of government, has been diminished or abolished by reason of clap-trap legislation.

The riots in the North, though they indicate a barbarous state of society, cause no serious uneasiness. The Protestants and Catholics of Belfast have long been in the

habit of displaying religious fervour by fighting one another on sacred anniversaries. The Feast of the Assumption of the Virgin, celebrated by the Roman Catholic Church on the 15th of August, has by an odd coincidence been converted in two countries to dissimilar political purposes. Under the French Empire it was discovered that the day derived additional sanctity from its consecration to a mythical St. NAPOLEON; and in the North of Ireland that anniversary has of late years been kept as a set-off against the commemoration a few days earlier of the battle of the Boyne. On Sunday last Catholic processions at Belfast, at Dungannon, and at Downpatrick, sallied forth to provoke the Orangemen, who eagerly accepted the challenge. The police at Belfast by great exertion kept the two bloodthirsty mobs out of one another's reach; but pious Protestants took occasion to wreck the homes of some of the members of the procession in their absence. At Dungannon the police were compelled to fire on the Catholics, who were even more unmanageable than their rivals. The petty civil war has probably been discontinued till next August, when it will once more symbolize the expediency of conceding independence to two irreconcilable factions which are only restrained from internecine conflicts by the authority of the Imperial Government. The Ulster riots, though in a high degree foolish and mischievous, are less dangerous than the sordid conspiracy of the Land League and of its Fenian accomplices. The Orangemen have at different times caused much trouble by their violence and by their sectarian organization; but they are not likely to join in the agitation for the repeal of the Union. They represent at the same time the vicious spirit of the old Protestant ascendancy, and the passions which are in some degree excused by the turbulent intolerance of their antagonists. It is remarkable that the Irish feud is reproduced in Canada, as well as in Liverpool. Even on their native soil Orangemen and their quarrels with Roman Catholics have little political importance. A century ago they were the most formidable opponents of English supremacy. Later experience has taught them that they and their co-religionists would be the first to suffer by the attainment of independence.

LORD STRATFORD DE REDCLIFFE.

LORD STRATFORD DE REDCLIFFE is the only English diplomatist who has in modern times acquired a popular reputation. His character and exploits have been celebrated with sympathetic eloquence by the historian of the Crimean war, whose admiration was certainly not diverted from the personage whom he calls the "Great Elchee" by the claims of formidable rivals. Mr. KINGLAKE, indeed, owes some gratitude to Lord STRATFORD DE REDCLIFFE for providing him with a subject by forcing on the war when the French and English Governments had at one stage of the negotiations submitted to the arrogant pretensions of Russia. The Emperor NAPOLEON, who had contrived the quarrel, was always inclined to vacillation, and his Ministers and confidential advisers were almost unanimously opposed to the war and to the English alliance. With the exception of Lord PALMERSTON and of the Duke of NEWCASTLE, the English Cabinet was to the last moment bent on escaping from the necessity of war; and both Governments had agreed to accept the formula of the Vienna Note, although it included a recognition of the Russian protectorate over the Christian subjects of the SULTAN. The English Ambassador at Constantinople stood alone in his determination to countergect Russian intrigues. On his recommendation the Porte assigned to the Note its true meaning, and refused to accept it. The Russian Government immediately afterwards publicly affixed to the document the interpretation which the Western Powers had affected to misunderstand. Although Lord STRATFORD DE REDCLIFFE at last precipitated the conflict, it might have been altogether avoided if he had directed the councils of England, and the policy of Lord ABERDEEN and his colleagues would only have postponed it. Lord STRATFORD would never have enticed the Emperor NICHOLAS into intolerable presumption by withholding warning and menace; nor would he have allowed a Chancellor of the Exchequer to propose a ridiculous and deceptive vote of credit for the conveyance of the Guards to Malta and back again. Even if the Ambassador had not forced the hand of the Government, the timid Ministers would, as one of them expressed it, have drifted into war.

Lord STRATFORD DE REDCLIFFE's decisive intervention at a great crisis recalled attention to the control over Turkish affairs which he had acquired and exercised during the busiest portion of his life. Like his still more famous kinsman, he had cordially sympathized with the cause of Greece while the struggle was proceeding; but the question had been settled for the time long before he became resident Ambassador at Constantinople; and he found it necessary to deal, not with races aspiring to be free, but with perversity and corruption in Turkey, and with the incessant efforts of Russia to create disorder as material for disaffection. To promote or to permit the dissolution of the Empire while he was accredited to its sovereign would have been repugnant to Lord STRATFORD's manly and loyal nature, even if the operations of an IGNATIEFF had been consistent with the policy of his Government. From the first he made it his business to reform the administration, in the hope that the existing order of things might be maintained by being first rendered tolerable. His stern and peremptory temper was well adapted to an enterprise which was rather that of a ruler than of a diplomatist. Before his mission began, the SULTAN had been brought to the brink of ruin by the rebellion of MEHEMET ALI, and he had purchased temporary protection from Russia under the degrading treaty of Unkiar Skelessi. Lord STRATFORD taught the Porte to look to England for protection, but always under the condition that the oppression of the Christians should be abolished or mitigated, and that misgovernment should be as far as possible corrected. The laws and decrees which were published at his instance were but imperfectly enforced; but the Turks had at least been compelled to recognize in theory the principles of modern civilization. If it had been possible that the same statesman should have overawed Sultans and Viziers to the present time there might probably have been no Bulgarian massacre and no Russian invasion. Unfortunately his immediate successor possessed none of his qualities; and the influence of England, which had largely depended on his personal character, gradually declined; yet, even as late as 1871, the tradition established by Lord STRATFORD so far subsisted that the Porte offered to give any answer which the English Government might direct to the Russian demand for the partial abrogation of the treaty. It was not surprising that, on the refusal of England to interfere, the feeble Sultan resigned himself to the treacherous inspiration of the Russian Ambassador.

Although Lord STRATFORD DE REDCLIFFE had been employed on several previous missions, his strictly diplomatic aptitudes were never fully tested. His graceful presence and winning manner scarcely indicated the imperious disposition which probably served his purpose better in dealing with Orientals than with European equals. He had the good fortune to learn his business thoroughly by early apprenticeship. In his time the equal right of all classes to enter the public service, and the consequent practice of competition were unknown, and it is one of the incidental advantages of aristocratic patronage that it provides opportunities for youth. WELLINGTON commanded a regiment and a brigade at nine-and-twenty, and a year or two later he won a great pitched battle. NELSON by family interest became a post-captain at twenty-one, and not long afterwards when he was taunted with his youth he could boast that he was as fit to command a frigate as the Prime Minister at the same age to govern the country. STRATFORD CANNING held a considerable diplomatic appointment before he was of age; and at five-and-twenty, when the allies entered Switzerland on their way to France, he was entrusted with the care of English interests as Minister Plenipotentiary to the Helvetic Confederacy. It was perhaps on that occasion that he acquired his first experience of the caprices of Russian absolutism. He was not of a disposition to sympathize with the postponement of the military and political interests of the allies to ALEXANDER's sentimental regard for his tutor LA HARPE, and for a Swiss lady who was attached to the service of the Imperial family. With ALEXANDER he afterwards maintained friendly relations; the Emperor NICHOLAS made a serious mistake when he made Lord STRATFORD his personal enemy, by refusing to receive him as Ambassador at St. Petersburg. One result of the EMPEROR's prejudice was the loss of the services in England of Princess LIEVEN, who had long been one of the most adroit of diplomatic

agents. As Lord PALMERSTON refused for some time to appoint another Ambassador at St. Petersburg, Prince LIEVEN was necessarily recalled; and neither he nor the PRINCESS returned to England.

Lord STRATFORD DE REDCLIFFE, like most statesmen of his own and of an earlier generation, was a classical scholar. In imitation of GEORGE CANNING he first made himself known by editing a school magazine at Eton, and he also possessed the accomplishment of making Latin verses. To the last he retained a love of his early studies, and after the age of ninety he wrote and published English verses which were not extraordinarily bad. With fuller right than the late Lord DERBY he would have excused his ignorance of some modern branches of education by his birth in the pre-scientific era. His literary ability was principally exhibited in despatches, which in his time were not, as at present, uniformly published for the gratification of popular curiosity. During his short Parliamentary career he failed to acquire distinction as an orator; and it is uncertain whether earlier practice would have enabled him to succeed in debate. His occasional pamphlets on the subjects which he best understood are not marked by conspicuous literary ability; but in some instances they belong to the period of his decline. As he is not numbered among Parliamentary politicians, and as his diplomatic employments were of an exceptional character, Lord STRATFORD DE REDCLIFFE may be most properly compared with the great Indian statesmen whose occupation must have been in some respects similar to his own. The business of teaching or forcing Oriental despots to administer their authority for the good of their subjects, and to maintain peace at home and abroad, has always been one of the principal means by which the Indian Empire has been established and consolidated. In India Residents and Political Agents have had the paramount power of the Governor-General as a last resort on which they might fall back when their personal influence was found wanting; but their merits have been generally measured by their ability to secure obedience and deference without the necessity of using force. In Turkey Lord STRATFORD DE REDCLIFFE could, in case of need, threaten to suspend the protection afforded to England by Turkey, but he mainly relied on the justice and expediency of the policy which he uniformly recommended. Pashas and Ministers, while they might secretly resent the dictation of a foreigner, knew that compliance with his demands would promote the general tranquillity and the security of the Empire. The mass of the population found that the agents who represented the Ambassador in the provinces were invariably hostile to the corruption and violence which they could but partially check. The political relation of England to the Turkish Government has recently been reversed, but popular confidence is more tenacious. It is not a little the result of Lord STRATFORD DE REDCLIFFE'S exertions that in almost every province of the Turkish Empire the establishment of English authority would be cordially welcomed.

THE INDIAN BUDGET.

THE statement made by Lord HARTINGTON in explanation of the Indian Budget was received with deserved approbation by all parties in the House of Commons. It had all or nearly all the merits which such a statement ought to have. It was clear, it was characterized by sufficient firmness and decision, and it was free from any tinge of personal bitterness or party animosity. Lord HARTINGTON had to give a sketch of the present state of Indian finance apart from the charges of the Afghan war. He had to make an estimate of those charges, to explain how it has happened that they so largely exceed the sum originally calculated, and to examine how so great an amount of miscalculation had been possible. Lastly, he had to consider the future of Indian finance, the possibility of reducing expenditure, and the contribution which England is to make to the cost of the war. With one salient feature of Indian finance, as it now stands, it was impossible he should not express satisfaction. In the three years under consideration there has been a total surplus of a little over eleven millions sterling. The vital question to answer in studying Indian finance is, how this surplus has been obtained, and clear as Lord HARTINGTON'S speech was in other respects, it was not quite so clear as could have been wished in this respect. A surplus is obtainable by the yield of new taxes, by the increasing productiveness of old taxes, by the reduction of expenditure, and by windfalls. The new taxes imposed to provide for what is popularly known as the famine insurance fund, yielded, or, taking in the current year, are estimated to yield, a total of 3,394,000*l*. Excepting the salt duty, there does not appear to be any ordinary source of revenue that is giving an increase. Reduction of expenditure accounts for a considerable portion of the surplus, especially for that of 1880-1, about two millions sterling less being calculated to be spent, apart from war charges, than in previous years. Lastly, the Indian Government has had several windfalls. The opium duty yielded two and a-half millions sterling more in the years 1878-9—1879-80 than was expected. The war caused a large amount to be paid to the railways for carriage of materials, and a million sterling appears to be accounted for in this way. Lastly there was, during part of the period referred to, an abnormal increase in the land revenue owing to the collection of famine arrears. While, however, we can gather from Lord HARTINGTON'S speech how, generally speaking, the surplus was obtained, we do not find in it materials for setting down precisely how much was gained under each head. Still we are enabled to arrive at one result which is of considerable importance. The only real and permanent source of the surplus is the reduction of expenditure. The new taxes, the produce of which has been applied to the cost of the war, must, if they are continued, be applied to the special purpose for which they were imposed, and do not enter into the proper Budget of India. The ordinary taxes yield so little of an income that they need not be taken into account. Windfalls must be treated as windfalls, and not regarded as an ordinary source of income. There remains the reduction of expenditure, which is a real and unquestionable source of surplus. Lord HARTINGTON, however, expressed an opinion that reduction cannot be carried much further, and it can scarcely be said to be as yet established that some part of the reduction has not been obtained by starving branches of the public service, on which more may have to be spent if they are to be kept in a state of efficiency.

The portion of Lord HARTINGTON'S speech which naturally excited the greatest interest was that in which he dealt with the cost of the war. He had nothing new to tell. It was known before he rose to speak that the Indian Government had made a most serious miscalculation, a miscalculation of nine millions sterling. The Indian Government calculated that the war would cost six millions, and it has cost fifteen. This is not as if the miscalculation only referred to sums that were to be spent. The astonishing thing is that the Indian Government spent million after million without knowing that it had gone. In the year that, according to financial language is now two years ago, 1878-79, it spent 2½ millions more than it had calculated on spending. It paid away all this money and never knew that it paid it. Although nine millions have been spent, or are to be spent on the war, there do not remain nine millions to pay, but only three and a half millions. The Indian Government has paid five and a half millions beyond its own estimates without having had a suspicion that not only the money had to be found, but that it had been found. Lord HARTINGTON stated that he has done his very best to inquire how this can possibly have happened, and has entirely failed to find out. The mysteries of Indian finance are so great, that not only are the people who manage the finances ignorant to the extent of millions of how the money goes, but an intelligent and industrious outsider, armed with full powers and bent on solving the puzzle, has not in three months been able to get nearer the truth than the first man in the street could have got. Lord HARTINGTON, with the frankness that was to be expected of him, repudiated the absurd notion that the Indian Government had been deliberately concealing the truth. As he pointed out, the high character for personal honour of the leading members of the Indian Government entirely precludes such a supposition; and, even if they had been knaves enough to plan such a deception, they could not have been fools enough to have supposed that it would have answered. If prosperity budgets had been cooked to serve electioneering purposes, they must, if successful, have recoiled on the very Ministry they were meant to serve. The particular mode in which the Indian Government made its mistake is easy to see. In accordance with precedent, it took as its guide only the

audited accounts of military expenditure, and only a small portion of the total of these accounts was audited. All that can be said is that it was a very unbusiness-like and unstatesmanlike mode of proceeding to take the audited accounts as a guide. The plain facts were what a skilful financier would have attended to. There were so many thousand troops moved forward, requiring such an amount of transport and provision. An easy calculation would have shown that the war could not be costing as little as the audited accounts suggested. It is of course only on extraordinary occasions that statesmen have to make such calculations. The leading members of the Indian Government were men who on an extraordinary occasion moved in an ordinary groove. This is all that can be said in their dispraise. And it must be owned that if they erred they erred in very good company. Mr. GLADSTONE long ago expressed his disbelief in the accuracy of the official calculations. But then Mr. GLADSTONE is a great financier. The instinct of financial genius told him that the accounts could not be right. He saw that a war on such a scale could not be carried on at the alleged cost. But the accounts of the Indian Government do not appear to have excited any misgiving in the Home Government. No doubt it was primarily the duty of the Viceroy and his Finance Minister to make the calculation which it now seems wonderful they did not make. But there were others who also might have been expected to inquire what the VICEROY and his Finance Minister were about, and that no one among their own friends or superiors had any criticism or suggestion to offer them must be allowed to mitigate any blame that public opinion in England may be inclined to attach to them.

Lord HARTINGTON said that he was not as yet prepared to say what contribution England ought to make to the expenses of the war. He must know what the total cost of the war would be before he could say how large was to be the share that England would take upon herself. He, however, stated that the contribution of England would be a substantial one, and that he was sure that Englishmen of all parties would be willing to make the contribution. He put it as a matter of justice, not of charity. India at this moment is not seriously incommoded by the payments it has made, or expects to make, for the war. It could pay the whole cost without any great difficulty. We are not to come forward to help India because India is poor, but because India, being solvent, has done work for us. According to Lord HARTINGTON's view, we have hired India to do something for England, and England must in simple justice pay the price of the hiring. If this is an accurate account of the transaction, Englishmen of all parties would certainly pay with the utmost cheerfulness what was due from them. But, when they have to pay, they will very much like to know what is due by them and why. Lord HARTINGTON said that, when we enter on war for purposes of Imperial policy and ask India to supply us with men, and with material of war, we ought to pay India for what it supplies us with. If this is intended to be a description of the Afghan war, England ought to pay the whole cost of it. The only intelligible ground on which India and England can be held liable to share the cost of the war is that it is a war waged partly for Indian and partly for English purposes. Let it be assumed that the objects of the war were twofold—the better defence of India, and the possibility of our concentrating our efforts on some spot nearer home in case of a war with Russia if we had not India to defend. It seems impossible to put a proper pecuniary value on these two purposes respectively. How are we to say that it is more just that England should pay a fifth than that it should pay a tenth of the cost of the war? It must be borne in mind that if England pays, not as a matter of charity, but of justice, we are creating a precedent which must guide us in all our future military dealings with India. There is therefore every reason why this precedent should be set with the greatest deliberation; and, above all things, we must take care that we do not, under colour of doing mere justice to India, punish England for having adopted what on reflection we may think to have been a wrong policy.

AFGHANISTAN.

THE announcement, made at the end of last week, that there were grounds for supposing an agreement to exist between ABDURRAHMAN and AYOUB naturally caused a certain amount of disquietude. It is true that no treachery or double-dealing in Afghans would in the least surprise any one who is acquainted with the Afghan character. But even if the intelligence had been very much more strongly corroborated than it actually was, a little thought would have been sufficient to show that it need cause no immediate alarm, and that, in all probability, it referred to a bygone state of things. That ABDURRAHMAN, as a mere pretender, should attempt to strengthen himself by an alliance with one who was actually in possession of a considerable portion of the country was likely enough; that he would imperil the immediate advantages accruing to him from the English recognition, the departure of General STEWART's force, and the concentration of our military efforts on the task of crushing his rival, was by no means so probable. From the point of view of the Government, which is, apparently, to get out of Afghanistan with the most speed and the best face possible, ABDURRAHMAN's complicity with AYOUB need not necessarily have been sufficient to make them change their policy, for that policy may be briefly described as a resolute refusal to look at the future. The policy of Mr. GLADSTONE's last Government, which was that of ignoring Afghanistan as much as possible, has been as faithfully revived as circumstances permit, and it seems to be a particularly sore point with the Ministerialists, in their discussions with their enemies, that the action of the latter has made its complete revival impossible. Lord HARTINGTON does not propose to abandon those advantages for which the late Ministry fought on the eastern side of the country, and he has not yet announced his intention of abandoning those gained by them on the southern. Notwithstanding the attempt of certain Government partisans to make out that the disaster of Kushk-i-Nakhud comes of occupying Candahar, and of the policy of the forward school, it is sufficiently evident that the disaster is the very strongest possible confirmation of the views of that school. The facility of an advance on India *viâ* Herat has been only too clearly made out, and the value of Candahar as a dyke against the waters of invasion has (notwithstanding the very questionable generalship of more than one officer concerned) been made out still more triumphantly. It may fairly be said that while the abandonment of Candahar before Kushk-i-Nakhud would have been evidence of a want of forethought, its abandonment after that event would be an unpardonable refusal to profit by the lessons of experience.

Although no actual war operations of great moment have taken place during the past week, information of one kind or another, which is interesting and important enough, has reached England. The persistent protests and questions of certain Members of the House of Commons have elicited statements from Lord HARTINGTON calculated to remove a good deal of the anxiety which was caused by the announcement of General ROBERTS's march. The GENERAL, it is now certain, carries with him sufficient supplies of the absolutely necessary kind, and when he has reached Kelat-i-Ghilzai, he will be able to fill up if necessary from the magazines of that useful post. The absence of any rumour of actual or intended obstruction to his force may be taken to show that in the most dangerous part of his route—the neighbourhood of Ghuznee—there are no signs of opposition. On the other side General PHAYRE is slowly massing, while at Candahar itself the siege has at last been formed, and seems to be proceeding with some briskness. In connexion with this siege there are, it must be confessed, some mysteries. It has suddenly become known that either one or two regiments of native infantry have at some uncertain time made their way to General PRIMROSE, so that officer has an effective strength not very far short of five thousand men. This is in itself well, though it is, as we have said, mysterious. But it is not so well that this force of nearly five thousand men, more than twelve hundred of whom are said to be Englishmen, should be lurking behind the walls of Candahar, while a force officially estimated at not much more than double their strength forms the siege against them. This was not the way in which England won India, and most assuredly it is not the way in which she can expect to keep it. From the reckless undervaluing of the force of the enemy, which led

to the disaster of Kushk-i-Nakhud, a revulsion seems to have taken place to an almost equally imprudent unreadiness to meet them. No doubt a certain amount of demoralization must have resulted from the mishap or the blunder of July 27. But the ghosts of CLIVE and COOTE and WELLINGTON and LAKE contemplating General PRIMROSE with five thousand men shut up in Candahar by AYOUB with ten thousand, would supply no bad theme for tragic poetry of the severer classical kind. It is, of course, impossible to say that General PRIMROSE, inferior as he is in cavalry and artillery, may not be justified in remaining strictly on the defensive. The enlarged estimate of his force may itself, in the singular confusion of intelligence which seems to exist, have been erroneous. But to think that we have at the present moment in garrison or on the march something like five-and-twenty thousand men resisting, or in chase of, a force of ten thousand, is not altogether an agreeable thought, and would be still less agreeable were it not that the awkward state of things can be pretty clearly traced to the carelessness or incompetence of individuals. There is something not a little pathetic in the fact that for comfort and consolation under these circumstances it is necessary to look to the fact that a garrison of Indian troops during the past week has actually resisted a tribe of freebooting marauders successfully, has pursued them some distance, and has inflicted considerable loss on them. The conduct of the garrison of Kuch deserves only praise; but it is a pity that its merits should be heightened by the force of contrast.

On the whole there seems to be no reason for immediate alarm about Afghan matters, nothwithstanding the activity of AYOUB at Candahar, but the same can hardly be said as regards the future. Such an enterprise as that in which we have been for two years engaged has far too much of the nature of a Nessus's shirt to enable us to throw it off and cut all connexion with it in the offhand fashion recommended to Lord HARTINGTON by many of his advisers. But even if we suppose that the new AMEER is induced by a knowledge of his own interest to keep tolerably good faith with us, the problem would be by no means satisfactorily resolved. The Government, perhaps for good reasons, have given no indication of the course to be pursued towards AYOUB. When General ROBERTS or General PHAYRE, or both, come up, he will, of course, either be beaten or will shun the contest. But the former result would not, save in the unlikely case of his capture, end the matter, and the latter would at once lay upon the Government the necessity of deciding a very difficult question. Are we to go to Herat, and, if so, what are we to do there? General ROBERTS will no doubt be quite as ready to go to Herat as to Candahar, and AYOUB's march in the opposite direction shows that no material difficulties will prevent his doing so. The strength of the place has been variously estimated, and if defended by a numerous artillery it might be awkward to attack. But that it can be taken, and will be taken if the orders are given, there is no doubt whatever. The point of interest is, whether the orders will be given; and, if so, what will be done with the place when we have got it. Persia is anxious for it; ABDURRAHMAN would no doubt be extremely glad to receive it at our hands; and the Russians profess a kind of MONROE doctrine in respect of it—a doctrine to which, it is hardly necessary to say, no English Government ought to pay the slightest heed. The necessity of going to Herat—a necessity which, if AYOUB is to be thoroughly punished and the disaster of Kushk-i-Nakhud thoroughly avenged, is almost unavoidable—would bring with it a further necessity, from which the Government seem nervously to shrink. Some day or other, perhaps when it is too late, the Afghan question must be faced fully and fairly, as it ought to have been faced when seven years ago Mr. GLADSTONE's Government adopted the fatal policy which has led to all these troubles. The present plan of simply getting out of the country as soon as possible can in no sense be said to be a full and fair facing of the difficulty. It may not indeed result in any immediate disaster, and those who have criticized it from this point of view may be thought not to have chosen the more excellent way. But it becomes more and more evident every year that India cannot be regarded any longer as if it were a possession by itself fenced round with a wall of brass. When a single nation has succeeded in acquiring the dominion of the entire northern half of a continent, the question of the mutual relations of the southern portions of that continent cannot be considered apart from this fact. Russia is a neighbour of Asiatic Turkey, a neighbour of Persia, a neighbour of Afghanistan, a neighbour of China; and Persia, Afghanistan, and the Chinese Empire are neighbours, or all but neighbours, of India. No partial dealing with the question can disguise the consequences of these facts. Understandings with Russia have not been so satisfactory in the past that we should revert to them in the future. But even the fanatical abhorrers of the forward policy must acknowledge that, if we once hold Herat, to give it up without a very careful consideration of the hands into which it might fall would be rash in the extreme. To hold it would certainly be a formidable undertaking. But one point which can be reaffirmed with certainty is that Candahar, properly held and not left in the air, bars the route from Herat. In the present instance the lesson has been as clearly taught to those who have eyes to see, as if General BURROWS had given AYOUB the beating which he ought to have had.

SOUTH AFRICA.

A BLUE-BOOK entitled "Further Correspondence respecting the Affairs of South Africa," while it contains some interesting matter, affords a specimen of the carelessness with which public documents are edited at the Colonial Office. Sir BARTLE FRERE very properly sent home two newspaper reports of an important debate in the Cape Parliament on the proposal for a conference to consider a plan of Confederation. The Department, merely to save some clerk the trouble of selecting the version either of the *Cape Times* or the *Cape Argus*, prints both reports in full at the public expense to the confusion of curious readers. The interest felt at home in the affairs of South Africa is not too absorbing to be satisfied with a single reading of a Colonial Minister's speech. Students of contemporary history who have sufficient leisure for the purpose will find that the debate is not uninstructive. The modern experiment of responsible government in the Colonies is gradually producing a novel type of Constitution, where all parties intended to conform to the English model. Political measures in the Cape Colony assume the form of Cabinet minutes addressed to the Governor, whose Ministers are at all times nervously anxious to assert their own independence. The Imperial Cabinet, on the other hand, has never found it necessary to acquire a legal position; and consequently it habitually disguises its own exercise of the royal prerogative. It was nominally by the act of the QUEEN, and not of Mr. GLADSTONE and Mr. CARDWELL, that purchase in the army was abolished without the consent of Parliament. Lord KIMBERLEY will perhaps have caused some displeasure at the Cape by assigning as a reason for continuing Sir BARTLE FRERE in office and afterwards for recalling him, the prospect of his being able to forward the policy of Confederation, and the subsequent defeat of the measure. It is highly probable that Sir BARTLE FRERE may have exercised great personal influence, but the most popular objection to Confederation is that it has been recommended by successive Secretaries of State and by the representatives of the Crown. Colonial politicians never forget their anxiety to convince themselves and others that they are mature enough to stand alone. Lord KIMBERLEY's despatch will not remove the impression that Sir BARTLE FRERE has been shabbily treated. "There had been," says the SECRETARY of STATE, "so much divergence between "your views and those of Her MAJESTY's present Govern-"ment on South African affairs that they would not have "thought it either desirable or fair to yourself that you "should remain at the Cape," except for the prospect of forwarding the policy of Confederation. The reason having now disappeared, the Government "with regret come to "the conclusion" that Sir BARTLE FRERE should be recalled. There has, in fact, been no divergence between the views of Sir BARTLE FRERE and of the present Government, though he dissented from the policy which was common to the late Government and the late Opposition. On their accession to office the present Ministers might properly and consistently have dismissed the GOVERNOR; but by deliberately availing themselves of his services they formally condoned any previous error which he might have committed. They recall him on account of the Zulu war after attempting to make use of the influence

which he mainly acquired by the questionable but successful policy which is now condemned.

Mr. SPRIGG, in an elaborate and able speech, ostensibly in favour of a Conference of the South African colonies, dwelt at least as earnestly on the impediments to Confederation as on the expediency of the measure. He remarked that Lord CARNARVON had, three or four years ago, assumed an initiative which belonged to the colony, and that Mr. FROUDE, who was supposed to possess the confidence of the Secretary of State, had conducted an agitation against the colonial Government and Legislature. He also complained that by declining to annex Zululand after the war the Home Government, through Sir GARNET WOLSELEY, had perpetuated or continued a system of tribal power which is inconsistent with the colonial theory of native administration. Mr. SPRIGG also found just fault with the mode in which the annexation of the Transvaal had been forcibly accomplished, when it might have been effected with the consent of the inhabitants. He recognized the difficulties which would arise from any possible mode of selecting delegates to represent the Transvaal at the Conference. The provisional Government is not at present elected by the people; and popular election would return opponents of the English connexion. Other speakers pointed out the objections to Mr. SPRIGG's conclusion that it would be desirable to intrust the appointment of delegates to popular meetings. In other respects it was not difficult to profit by the admissions of the COLONIAL SECRETARY, or to answer the objections which he had offered of difficulties suggested by himself. He had carefully confined himself to arguments in favour of a Conference, professing to leave the question of Confederation open; but it was perfectly evident that a vote in favour of a Conference involved the principle which the delegates were to apply. After a long debate, Mr. SPRIGG stated that he had from the first determined not to carry the measure by a bare majority, and that he believed the votes to be equally divided. He therefore acceded to a motion for the previous question, which was equivalent to the rejection of the Conference, while it left the principle of Confederation in abeyance. In a subsequent sitting, when a vote of confidence in the Government was moved, the Opposition withdrew in a body. It may therefore be understood that Mr. SPRIGG still commands a majority, but henceforth the proceedings of the Cape Parliament will attract little attention in England. The recall of Sir BARTLE FRERE seems to excite general regret, and it may be assumed that no former Governor has acquired to the same extent the confidence of the colonists. Probably his chief merit in their eyes is the Zulu policy, which has caused his recall.

The only exception to the general approval of Sir BARTLE FRERE's administration justifies the belief that he has done much to confirm and extend the loyalty of the South African population. The professed enemies of the English connexion spare no terms of vituperation in speaking of the HIGH COMMISSIONER. In a letter to Mr. COURTNEY, who has undertaken to represent the claims of the Transvaal Boers in the House of Commons, Mr. KRUGER and Mr. JOUBERT sneer at the supposed defeat of the "great man" who was charged with the establishment of a South African Confederation. It seems that either Mr. GLADSTONE's Ministry, or Sir BARTLE FRERE, or perhaps both, represent a system which is "the establishment and the extension of a British "Napoleonic Empire, ostensibly subject to the Home Par-"liament, but really governed by two or three persons in "Downing Street, and governed as arbitrarily as, for "instance, Cayenne under NAPOLEON III." Lord KIMBERLEY, Mr. GRANT DUFF, and Mr. HERBERT, seem to be the present tyrants of the South African Cayenne. Another passage is directed exclusively against Sir BARTLE FRERE. "The Zulu war was prepared in a lying way, "and was defended with lying arguments. The book of "Miss FRANCES COLENSO deserves to be consulted on this "point. The indignation in England was great, but the "stubborn obstinacy of the Satrap was greater still. And "he obtained the victory even over the Liberal Ministry." Mr. COURTNEY may perhaps not be proud of clients who fail to perceive that, if their statement is true, the whole responsibility is transferred from the Satrap to the Liberal Ministers. It is remarkable that even the Transvaal agitators think it worth while to assert that "there exists "warm unanimity in the whole of South Africa; the "country is ripe and adapted to union; it is also suffi-"ciently powerful to govern the blacks vigorously and "justly; but who has created the disharmony? The system? "If the Republic had been honestly and generously assisted, "the gratitude of the people would have been prepared "for great self-sacrifice." It is indeed greatly to be regretted that assistance to the Transvaal was not withheld until it was earnestly demanded; but Sir BARTLE FRERE, who had no share in the annexation, has at the expense of his own countrymen conferred enormous benefits on the Transvaal. The Boers of the Republic would almost certainly have been attacked and conquered, perhaps exterminated by CETEWAYO, if Sir BARTLE FRERE had not assumed the offensive, on, it may be admitted, insufficient grounds.

Some of the opponents of Confederation have communicated with Mr. GOLDWIN SMITH, whose energies have for some time been directed to the annexation of the Dominion of Canada to the United States. It would have been difficult to find any other Englishman who regards the Canadian Confederation as a failure; but it is probably true that, as Mr. GOLDWIN SMITH points out, the system requires an inconveniently large number of members of legislative Assemblies, and of administrative functionaries; and the same objection might be raised to the institutions of the United States, which served as a model for Canada. In South Africa the difficulty may perhaps be overcome by the successive annexation to the Cape of the neighbouring provinces. Though the territory is wide, the white population is scanty, and the revenue of all the colonies only amounts to about 6,000,000*l*. West Griqualand is, with the sanction of the Home Government, to be immediately annexed; and perhaps the process may eventually extend to Natal, and even to the Transvaal. The mother-country has no motive for interference either to retard or to accelerate union, except as far as it is thought necessary to undertake the defence of the smaller provinces. In the absence of a strong Imperial garrison the Cape will, for its own sake, not allow Natal or the Transvaal to be overrun by Swazis or Zulus. With its own native population the Cape Government is disposed to deal vigorously. The disarmament of the Basutos has been completed, and there is no sign of renewed resistance. The Zulus have since the war caused no serious uneasiness. One of the speakers in the debate on the Conference asserted that Sir GARNET WOLSELEY had substituted thirteen CETEWAYOS for one, but thirteen petty potentates are much less formidable than one warlike chief. Sir BARTLE FRERE will have the satisfaction of leaving South Africa in the enjoyment of peace and prosperity, and of bequeathing no considerable difficulty to his successor except that of conciliating the inhabitants of the Transvaal.

THE EMPLOYERS' LIABILITY BILL.

THE debate on the third reading of the Employers' Liability Bill gave the Fourth party an additional opportunity of "facilitating" public business, and raised a not very relevant question as to the terms on which workmen are employed in the Government service. Otherwise it contributed nothing new to a discussion which had already been needlessly long. The tactics of Mr. GORST and his friends while the Bill has been under consideration have been extremely simple. They have endeavoured to overthrow by a succession of side winds a compromise which the House of Commons had accepted when it was directly proposed. This late-born zeal to go all lengths with Mr. MACDONALD does more credit to the ingenuity of these gentlemen than to their consistency. The progress of the Bill through Committee was delayed down to the very last day by farther convictions of sin on the Conservative benches. When the present Opposition were in office common employment was treated as a principle too sacred to be touched. Since they have crossed the House they have been more and more disposed to destroy what they once worshipped; and yesterday week the late Solicitor-General proposed to abolish the plea altogether in the case of Railway Companies. Why Railway Companies should be denied a benefit which would still have been allowed to all other industries Sir HARDINGE GIFFARD did not attempt to show; and we can only suppose that in Conservative eyes a Joint-Stock Company is a less interesting victim than an individual colliery owner. From this novel point of view a corporation may be regarded as wanting a pocket to be picked as well as a body to be

kicked and a soul to be saved. It is curious that a proposal of this kind should come from a party which is usually supposed to sympathize with corporations. Sir H. GIFFARD failed, however, to carry all his party with him. Sir WALTER BARTTELOT is too old to dance to the new Conservative pipe, and he fell back on the commonplace argument that the amendment went in a direction never contemplated by the Bill into which it was proposed to insert it, and that a single interest ought not without careful consideration to be picked out for exceptional treatment. The House of Commons supported the Government view, as it usually does when the Government provides a view to be supported, and the amendment was rejected.

The same question came up in another form at the evening sitting, and under circumstances of greater difficulty. Mr. MORLEY proposed that Railway Companies should be held liable for the negligence of any person who has charge or control of any signal, points, engine, or train, and his amendment was accepted by Mr. DODSON and agreed to without a division. Is this exceptional legislation? The Directors of the Midland Railway contend that it is. In a statement read on their behalf to the half-yearly meeting of proprietors on Tuesday, they say that "within the last "few days an amendment has been made to single out "Railway Companies from all other employers of labour, "and to put them under a special liability." Colliery owners and ironmasters are made liable only for the acts of servants "who have superintendence entrusted to them, "and are not engaged in manual labour," but as the Bill now stands, "Railway Companies are to be responsible for "any negligent act of servants engaged in carrying on traffic, "such as signal-men, engine-drivers, or guards." This is certainly a plausible contention. At first sight it does seem as though a burden which had been thought too heavy for colliery owners and ironmasters had been placed upon Railway Companies. As regards all classes of employers except Railway Companies, the object of the Government Bill is to make legal and moral responsibility go together. That which an employer can prevent, if he takes pains, the Bill aims at making him take pains to prevent. He is held responsible for the negligence of his foremen and of all who have the superintendence of other workmen, because the appointment of them is an act of choice not of chance. He is not held responsible for the negligence of his ordinary workmen, because they are necessarily taken on without selection. All that the Railway Companies ask, according to their own account of the matter, is to have this same measure applied to them. They resent being held responsible for the negligence of the ordinary workmen employed on the line and in the carriage of passengers and goods. Signalmen or pointsmen, guards or engine-drivers, are, they say, to a Railway Company what an ordinary miner is to a colliery owner. The duties they perform are duties, not of superintendence, but of manual labour. This is shown by the very fact that it is necessary to introduce a special clause to make the Companies liable for their acts. If they had been superintendents of other men's labour, they would have been included in the general provisions of the Bill.

Before, however, the force of this reasoning is unreservedly acknowledged, two things have to be considered. The first is that, although guards, engine-drivers, signalmen, and pointsmen may not have the superintendence of others, they occupy a position very distinct from that of ordinary workmen. They are not taken on one week and let go the next, just as work happens to be brisk or sluggish. They constitute to some extent a service the admission to which is by selection. They are picked out for the work they have to do, not taken on simply because there is work waiting to be done and they offer themselves to do it. A Railway Company which was careless in the choice of men to fill these places in its service would undoubtedly be to blame if their negligence had any ill consequences; and the Bill does but attempt to convert this moral responsibility into a legal one. Unless the Railway Companies can plead that they know and can know nothing as to the qualifications of the men they entrust with the conduct of trains, the driving of engines, or the management of points and signals, they have no right to complain if they are treated as though they had some knowledge on these matters. If they are able to set up this plea the public will in future have a very much keener sense of the dangers of railway travelling. The second thing to be considered is that there has often been good ground for attributing the negligence of railway servants employed in critical work to the rules by which their work is regulated. It is impossible for a man to have his full powers about him after he has been working more than a certain number of hours, and it has constantly been asserted, and never, so far as we know, disproved, that on railways the hours are sometimes very long indeed. If a pointsman is sleepy he may turn a train upon the wrong rails without meaning it. If an engine-driver is sleepy he may go on against a signal without knowing what he is doing. If in either of these cases the inability of the man to do his work properly is the result of his having been employed for an unreasonable number of hours, the regulations which compel, or encourage, or permit him to go on working after his power of working well is for the time exhausted are to blame for any accident that may follow. If, therefore, the Railway Companies could not be brought under the Bill in respect of their responsibility for the choice of these particular classes of workmen they would come within its provisions as regards the rules which regulate their work. Assuming that they employ an engine-driver or a signal-man for sixteen hours when he only has his full wits about him for ten, the regulations under which they do so are at fault, and they and their authors may not unfairly be held responsible for any evil that they cause.

Although the principle of the Employers' Liability Bill is sound, it is quite possible that in its tedious progress through the House of Commons some contradictory or unreal applications of this principle may have found their way into it. To amend faults of this kind is one of the most useful functions that a Second Chamber can discharge, and it will be unfortunate if the delay in sending up the Bill should prevent its receiving careful and adequate criticism at the hands of the House of Lords.

CHINA.

AN article in the *Nineteenth Century* by Mr. BOULGER, whose statements and opinions on any subject connected with Asia are sure to command general respect, gives a curious and interesting sketch of the present state of the vast Chinese Empire. Far from being dead or dying, China appears to be more alive than ever, and not only able to hold her own, but inclined to push herself forward, and regain what in times of greater debility she has lost. When the ancient wealth, the vast population, and the unconquerable pertinacity of China are taken into consideration, it is easy to see that she is in some respects the strongest and most formidable Power in the world. But what makes China especially interesting to us in the present day is that it and its attendant Empire of Japan present the only force of vigorous civilization on the globe which is not the force of Europe. If all Christendom is grouped together, and the populations directly affected by the notions of religion, government, and arts of Christendom are massed, and on the other side are placed China and Japan, we have two groups not very unequal in numbers, and each showing that human society can be highly organized under it, but presenting radical differences at every point with the rest of the world. In the third group, the Mahommedan Powers took the lead, but none of them present anything that can be called a living civilization. They have a power of coherence, due partly to fighting qualities and partly to a genuineness of religious belief, but they are all decaying, and are to a large degree dependent for their existence on the pleasure of the members of the first group. Their greatest vitality is in their least civilized elements. Albanians, Afghans, Arabs, Turkomans, and other wild people, are the most vigorous of modern Mahommedans. Such kingdoms as Siam and Burmah go on, but not in a manner to present anything like rivalry to Christian civilization. They and all the world, except China, are to us very much what the barbarians were to the Greeks. We may study them and trade with them and occasionally see reason for killing some of them, but we are always conscious, and so perhaps are they, that we are the superiors and they the inferiors. It is not so, and cannot be so, with China. A third of the human race, occupying one of the most favoured portions of the earth's surface, with a civilization that was old when ours began,

strongly cohering, animated by fixed principles and pertinaciously striving towards a fixed goal, is a phenomenon which nothing but egregious vanity or hopeless ignorance can despise. At present we have nothing to do but to study China so far as with our very imperfect information it is possible to study it. We cannot do the Chinese, nor can they do us, much harm or good. But their unique importance must continually arrest our attention with an increasing force. For they will press themselves on our notice, and the restless speculation and inquiry of Europe will be more and more attracted to the only sphere of human society where something is to be examined at once new, vast, vigorous, and unlike all to which we are accustomed.

The first thing to attend to in examining the present practice of China is the greatness of its recent military successes. The great rebellions in the centre, the south, and the west, have been suppressed. Kashgaria has been reconquered, and the border tribes have not only been witnesses of the new power of China; but have been reminded of the ancient ties which bind them to her. Vast tracts of country, depopulated during the civil wars, are being gradually allotted to colonists. The finances are satisfactory. The revenue reaches something like sixty millions sterling, and would, in the opinion of Mr. BOULGER, reach a hundred millions with a purer and more perfect administration, while at the same time the Chinese are the lightest taxed of all nations. The army falls little short of a million on paper, and may perhaps be able to furnish 200,000 effectives, and an equal number who are capable of being made effectives after some delay and practical experience. The Tartar troops, which are the real fighting part of the army, are provided with modern weapons either of the Bordan pattern or procured from the United States. A native arsenal supplies nearly, if not all, the ammunition required for the army, and although the small arms factory is not yet in working order, artillery of considerable calibre has been turned out. Armstrong forty-pounders, manufactured by Chinese hands, have been sent to supply the active army, and one-hundred-and-fifty pounders similarly constructed have been placed in the forts on the Peiho. In a very short time, Mr. BOULGER thinks, the new arsenal will have rendered China independent of the foreigner for munitions of war. A naval dockyard has also been established, and although at the outset the works were damaged by a typhoon, the Chinese are not the sort of people to be discouraged by an accident, and within ten years or so Mr. BOULGER prophesies that China will have an arsenal and shipyard rivalling anything we possess. The civil and military services need great reform, and there is much peculation in high quarters. China has to deplore exactly what Russia has been deploring so bitterly since the exposures consequent on the late war. Some steps towards reform have already been taken, the chief of which seems to have consisted in the promotion of officials on grounds other than that of literary merit. What Mr. BOULGER most insists on is the independence of China of foreign trade. Customs duties add four millions annually to the national revenue, but these are only four millions added to sixty. China can supply itself with everything it wants in peace, and will soon be able to supply itself with everything it can want in war. For reasons which Mr. BOULGER does not think it necessary to disclose, the authorities of the Empire do not favour the introduction of railways, and Mr. BOULGER thinks they are right. He considers railways dangerous in China, and we can only wish he had thought it within his province to state why they are dangerous. He contents himself with remarking that railways are superfluous in a country which is traversed by a network of navigable rivers and possesses an excellent system of roads.

We naturally ask what this strong, rich, compact, warlike Power may be expected to do when it begins to feel its new strength and has made this strength assured. In the first place it will, Mr. BOULGER imagines, begin to treat all foreign Powers in a different way. It will not stop foreign trade, but it will try to regulate it after its own fashion. It will discuss all questions concerning this trade as an equal treating with equals. If, for example, it dislikes the opium trade, it will say so, and will insist that it shall stop. With England as the mistress of India, it will be slow to come into collision. It might be irritated by any extension of our Indian Empire in the direction of Burmah, and it already, Mr. BOULGER suspects, takes more interest in the affairs of Nepaul and Cashmere than is ordinarily supposed; but an invasion of India is far away from its thoughts, not only because the task would be hopeless, but because all races and creeds in India are united, if in nothing else, in detestation of the Chinese. Everything is different when we come to speak of Russia. War between Russia and China is, in the opinion of Mr. BOULGER, a matter of certainty. It may come this year, it may come next year, or it may not come for ten years. But it must come sooner or later. China will go to war with Russia as soon as it dares to do so. Every year it may expect to get stronger. It is already the equal, if not the superior, of Russia in financial strength. Although its army is not comparable as a whole to that of Russia, it could place, with much greater ease than Russia, large bodies of troops on the field of contest, which would be on the Chinese borders, and it will soon be able to provide all the stores of war it needs, so that Russia, if superior at sea, would have nothing to intercept. Above all, it would have the border tribes with it—secretly at first, and openly on the first gleam of success. Even if beaten at first, China might profit by its reverses, just as the internal rebellions have been suppressed by the discomfited provincials having at last learned to fight better than the rebels. Being thus in a condition to go to war with Russia, it will go to war because at a hundred points there is a cause of quarrel. Russia holds what China longs to regain. Russia has exacted concessions from China which China feels to be humiliating, deeply resents, and longs to annul. Whether all Mr. BOULGER's statements are accurate we do not pretend to have any independent means of judging. But every one who reads what he writes will own that he has the air of writing with care, with deliberation, and with a wish to get at the truth. And, if he is right, or nearly right, in his main contention, it is evident that the danger with which Russia is menaced on the side of China must form a most important element in the calculations of European policy.

THE FRENCH MARRIAGE LAW.

THE cruelty which the French law of marriage occasionally inflicts upon Englishwomen is strikingly illustrated in the case of Mme. DESAINTE. This unfortunate young woman was married in 1876 to a young Frenchman whom she no doubt believed to be of full age. In the eye of the English law he was so, for he was well over twenty-one. In the eye of the French law, however, he was still a minor, for he was only twenty-two. The marriage was a perfectly legal one according to English ideas. It was solemnized in church and after due publication of banns. Some three years later M. DESAINTE for the first time informed his father that he had a wife. At first the family do not seem to have made up their mind to dispute the validity of the marriage; but either they or the young man himself determined upon reflection that he would be happier single, and when Mme. DESAINTE went to Paris to claim her husband she was turned out of the house. The Civil Tribunal of the Seine has since set aside the marriage on the familiar ground that the husband was under five-and-twenty, and had not obtained the consent of his father and mother. A case of greater hardship cannot be imagined. A young woman suddenly discovers, after three years of married life and the birth of children, that, according to the law of her husband's country, he is no better than her seducer. That M. DESAINTE is destitute of the least shadow of honourable feeling does not need to be said; but, unluckily, there was no way open to Mme. DESAINTE of ascertaining his deficiency in this respect. A girl who allows herself to be seduced at least knows the risk she is running; but a girl who accepts an offer from a young man who, so far as she knows, is in all respects able to contract a valid marriage, has no reason to think that she is running any risk whatever. Her lover has apparently given her the accepted proof that he is in earnest. He has offered to marry her, and to take the burden of her support upon himself.

It is natural that when cases of this kind are made public there should be a good deal of outcry against the alleged absurdity of French law. Undoubtedly it is a question whether, in one respect, it might not be beneficially altered. When a young man goes into a foreign country and there contracts a marriage which by the law of

that country is a good marriage, we do not see why it should not be held valid in the country of the husband. If an opportunity should offer itself for a general revision of the European marriage law, this proposal might be very properly made to the French Government, and to the Government of any other country in which the conditions demanded for a valid marriage are more severe than those demanded in England. There is very little chance, however, that any such proposal would be accepted. It would be considered by French parents, and in a sense rightly considered, to be a wholly one-sided proposal. They have no desire to see their sons rendered more open than they already are to the attractions of designing young Englishwomen. They would rather hold that the reason for maintaining the French law as it is applies with even greater force in England than it does in France. At home their sons are protected by many things besides the law; abroad the law is all that a parent has to trust to. At home his father and mother can to some extent look after him, and so far as marriage is concerned the relations of any young woman with whom he makes acquaintance are not likely to allow an intimacy which, if it is carried on against the wishes of his parents, can hardly bring a girl much happiness. Abroad he is out of his parents' sight, and the relations of any young woman for whom he may conceive a foolish passion do not know how important parental consent is in France, and are not disposed by habit and tradition to attach much importance to it for themselves. So long as the French law continues what it is, French parents are safe. If the worst comes to the worst, they can set a marriage aside. Without this protection they would never have an easy moment while their sons were abroad. They would never know of what imprudence they might not be guilty nor with what irremovable consequences their imprudence might not saddle them. We can hardly conceive a more unpopular measure as regards Frenchmen than one which proposed to make a marriage valid provided that it was so by the law of the country in which it was solemnized.

There are only two ways, therefore, in which Englishwomen can be protected against such a fate as that which has overtaken Mme. Desainte. One is to persuade the French that our marriage law is preferable to theirs. This undertaking would be even more hopeless than the attempt to alter the law as applicable to foreign marriages. There is not the slightest reason to suppose that the French are in the least dissatisfied with the existing restrictions on early or clandestine marriages. When the *Times* urges M. Dumas to "expose this incentive to the gratification of loose passions," it forgets that M. Dumas knows his countrymen a great deal too well to do anything of the kind. The sorrows of the too-confiding young woman who marries a young man of two-and-twenty, without so much as thinking whether he has parents or not, do not lend themselves to M. Dumas's purpose. The question of divorce suggests innumerable situations which can be turned to account by an academician who is at once a dramatist, a novelist, and a moralist with a turn for writing pamphlets. In a deserted wife such a writer would see nothing calculated to fix his readers' attention. Nor is it safe to assume too easily that the French law is in itself a bad one. The mischiefs of precipitate and imprudent marriages are often bewailed in this country. There is no doubt that precipitate and imprudent marriages are very greatly kept in check by the law which renders the consent of parents necessary to a valid marriage until twenty-five. It may seem very shocking to Englishmen that a young man of twenty-four should be still in bondage to his father and mother in a matter so important as marriage. But, when a young man of twenty-four makes a fool of himself by marrying some young woman of whom it is easy to foresee that he will probably grow tired before the year is out, it is not quite so plain that the French law is mistaken in making such unions practically impossible. At all events, there is not the slightest chance that the French public will see the merits of the English system. They are accustomed to their own law, and the only class to whom it can be irksome are very young men and women—a class which, powerful as it may be in many directions, has not much influence on legislation.

As there is no chance of the French consenting to alter their marriage law to meet a hardship which they do not recognize and are rather anxious to see maintained, the only way in which young Englishwomen can be protected is by some modification in the law of their own country. There is no need to go the length of holding a marriage invalid which has heretofore been held to be valid. That would not make the position of young women like Mme. Desainte any more endurable than it is, supposing them to be already in it, while it would be more than is required in order to save them from unwittingly placing themselves in that position. Supposing that the official to whom M. Desainte applied for the publication of banns had been bound on learning his nationality to inquire whether he was over twenty-five, and in the event of his being under that age to demand the same evidence of parental consent that would have been demanded in France, it is probable either that the necessary consent would have been obtained or that the marriage would never have taken place. At all events, Miss Belgrave would have been protected against everything but that against which no law can give complete protection—deliberate lying. M. Desainte might have represented himself as older than he was—though even this might be obviated by requiring documentary evidence of age, or he might have forged his parents' consent, but these are not precisely the acts of an ardent young lover who is eager to make an imprudent marriage, and against such acts all laws are for the moment powerless. The fact that the protection to be afforded to young Englishwomen cannot be made theoretically complete is no reason for not making it sufficiently so to meet the great majority of cases.

VISITING JUSTICES AND THE PRISON COMMISSIONERS.

UNEXPECTED questions turn up in Committee of Supply, and on Monday the House of Commons found itself engaged in a discussion of the principle not of a Bill which it is proposed to pass this Session, but of an Act which was passed some Sessions ago. It is difficult nowadays to say which of the many novel expedients resorted to by members of Parliament who wish to distinguish themselves in the byways of public business is the most inconvenient; but the course taken by Mr. Magniac with regard to the salaries of the prison Commissioners may certainly claim a high place on the list. This gentleman is possibly under the impression that he exercised heroic self-denial in not moving the reduction of the vote by the amount of these salaries. He would have done so, he said, had the vote been reached earlier, but in consideration of the period of the Session he graciously waived his right and allowed the vote to pass. Unfortunately he did not at the same time waive his right to make the speech which would have accompanied his motion, so that as far as the consumption of time went the gain resulting from this forbearance was merely nominal. Few things could be more absurd than the spectacle of the House of Commons on the 16th of August debating a suggestion that the salaries of a body of officials appointed under an Act of Parliament, for the discharge of duties of very high importance, should be withheld from them because Mr. Magniac is of opinion that the Act of Parliament which appoints them should never have been passed. On this theory there is really no limit to the questions which may fairly be raised in Supply. If Mr. Magniac's example is followed, we may expect to see Mr. Richard moving the disestablishment of the Church under cover of a proposal to pay no more salaries to the bishops. The commonsense view of these questions used to be that, when an official was appointed by Act of Parliament, and paid by the Treasury, you either repealed the Act of Parliament or voted his salary as a matter of course. On Mr. Magniac's plan every institution of the country may be challenged, not on its merits, but on the vote to defray its expenses. It is difficult, no doubt, to define the exact limits within which it should be permissible to debate the question whether the salary of an official shall continue to be paid to him; but it is safe to say that it ought not to be done simply as a mode of discussing whether the office he holds shall be maintained.

Mr. Magniac's speech showed, as might have been expected, a radical misconception of the question which he had thus dragged in by the head and shoulders. The

Prison Commissioners, he said, had been appointed by the Government on the plea that as the Government paid the cost they were entitled to control the expenditure. This version of the matter states but a very small part of the case in support of the Prisons Act. It is true that the Government, being perpetually asked by the local authorities to take some burden or other off the rates, were glad to find a payment which they could make themselves. In this way they hoped to avoid the extravagance which is so apt to grow up when money is raised by one set of persons and spent by another. But there was a far more weighty reason than this for transferring the control of prisons from the local to the central authority. So long as the Visiting Justices determined how prisoners should be treated, there was a constant tendency to variation. No two gaols were alike in this respect. In one prison hard labour meant the crank or the treadmill; in another, it meant a little light industrial employment, such as befits an amateur with time on his hands. In one prison solitary confinement was a reality; in another it was merely a name for mutual intercourse, made more enjoyable by futile attempts to suppress it. In one prison the regulations were lenient and the dietary fairly liberal; in another the regulations were strict and the dietary limited and monotonous. Much may, no doubt, be said in favour of each of these opposite methods of dealing with criminals, and the advocates of leniency and severity respectively seem no nearer an agreement than they were ten years ago. But, however the controversy may in the end be settled, there can, one would think, be no doubt as to the propriety of adopting the same method in all prisons. Whatever may be the character of the discipline in force, it should at all events be uniform. If it be not uniform there can be no such thing as fairness of punishment. When a man in Lancashire and a man in Dorsetshire are sentenced to twelve months' imprisonment for identical offences, the object of the Legislature certainly is that, having been equally guilty, they should be equally punished. But, if the Lancashire justices take one view of prison discipline and the Dorsetshire justices another, there can be no such thing as equality of punishment. The quantity of the imprisonment is the same in the two cases, but its quality is altogether different. This absurdity was got rid of by making the Prison Commissioners, not the Visiting Justices, the managers of prisons. The same end might perhaps have been attained by establishing a uniform code of prison discipline and leaving the Visiting Justices a merely administrative authority. It was every way better, however, that the management of prisons should not be of too routine and machine-like a character. We have no right to feel sure that the last word has been spoken upon any of the disputed points of prison discipline, and so long as there is a body of Commissioners in existence charged with the duty of watching the effect produced on the prisoners by this or that treatment there will always be room for reconsideration. All that is wanted is that the best lights that can be had for the time being shall be the lights employed in prison administration. If the Commissioners see reason to doubt the efficacy of severity, by all means let them try the experiment of lenity. If they are convinced that lenity is mistaken, by all means let them return to severity. But for the time being severity or lenity should be the rule, not in one prison but in all. The thief who is sentenced at one Quarter Sessions should know that he may expect precisely the same punishment as the thief who is sentenced at another Quarter Sessions. It may be expedient from time to time to try experiments in Prison Discipline, but they should be experiments directed to the discovery of the best method of treating all prisoners, not to the gratification of individual fancies on the part of this or that bench of Visiting Justices.

At the same time it should not be forgotten that Visiting Justices have still a very useful function to fulfil. The Commissioners of Prisons are like other men in this, that they will probably do their work all the better for doing it under external supervision. It is well that they should know what the world thinks of their acts, and how their method of dealing with prisoners commends itself to men of ordinary intelligence outside the office. The Visiting Justices can, if they choose, do the prison Commissioners this service. They are the persons best qualified to criticise prison administration, because they have a real knowledge of much that relates to it, and the immense variety of view which prevents them from being a good administrative body makes them an admirable critical body. From this point of view even crotchets are not to be despised. They may have a germ of sense lying hid somewhere about them, which, when discovered and separated from the nonsense with which it is associated, may convey a valuable suggestion or a necessary warning. Nor is this the only use to which Visiting Justices may be turned. It is not enough that the Commissioners should administer prisons wisely; they should also be known to administer prisons wisely. The public are always ready to listen to stories about prison cruelty, because they know how much room prison life must give for cruelty. The relation of warder and warded is necessarily one in which the one has very great power, and the other next to none, and the only way in which any check can be kept on the exercise of this power is by giving the prisoners adequate opportunity of making complaint. The visits of the Commissioners are too rare for this purpose, and the prisoners probably regard them as in league with the warders. The Visiting Justices have the advantage of being entirely independent of the prison authorities, and, if they are satisfied, the public will feel that the best possible precautions against prison abuses have been taken. If they are not satisfied, there is the Home Office and Parliament to appeal to, and Visiting Justices are usually men who have considerable power of making their remonstrances heard in either of these quarters.

AUTUMN MANŒUVRES.

THE time of year is at hand when the armies of the principal European Powers will, in default of finding employment against each other, be actively engaged in the exchange of amicable hostilities among themselves. The gathering in of harvest leaves the field free for "autumn manœuvres." In Russia numerous corps convened from a vast area will be gathered in such masses as would have delighted a general of the Napoleonic time. In Germany the congregation of soldiers will be more select than numerous, and the expectation of "getting a wrinkle," and the certainty of seeing the nearest possible imitation of actual war will attract to the theatre of manœuvre a host of experts, critics, special correspondents, and sight-seers. In Italy, the precision and completeness of the German system will be represented with a fair degree of imitation, though perhaps, as in former years, the inevitable admixture of superior with much inferior military stuff in the intense desire to display numbers may give to experienced outsiders an impression that the machine, on the whole, is weak and unequal, and scarcely calculated to bear any violent strain. In Austria, immense advances have been made on all sides, and if the South Germans are still not on a level of proficiency with their northern brethren, there is always a good deal to be learned by those English officers who attend their manœuvres. Austria, moreover, is the country before all others where our officers are made cordially welcome, where they are sure of meeting brother officers who are thorough gentlemen, excellent soldiers, and agreeable comrades, and where they have the power of doing not a little in friendly companionship towards strengthening those ties which traditionally unite the two countries, and which it should be the duty as it is the interest of every British Administration to unite yet closer. Of France we shall treat at greater length further on.

With regard to Russia, we know from the reports of last year's proceedings that, however much the pride and ambition of army leaders were gratified by the visible improvement in tactical proficiency effected in the large bodies under their command, they were not unconscious of the clear superiority shown by their German rivals in all that relates to the conduct of peace manœuvres. From the conduct of these to those of real campaigning there is but a step, as matters are understood in Germany. Of what other country can the same be said? The late war revealed to the Russian Government the shortcomings of its military administration, the imperfection of its armaments, the tactical misapprehensions of its generals and superior officers, and the utter unreadiness of the army generally, had it been called upon to meet troops instructed and manœuvred after the modern German method. Not that the Russians had not made a note of Sadowa, and taken warning by Sedan, but they had only half learned the lessons these should have conveyed, and when war broke out with Turkey the extent of their own deficiencies took them by surprise. They are now busily engaged in making up for lost time, and though their progress does not appear to be rapid, and the machine seems by comparison somewhat unwieldy, yet it must be remembered that this machine is of portentous dimensions. To note in a passing phrase something of the difficulty obstructing the path of reform, we must consider over what a vast area, traversed by what indifferent communications, a comprehensive scheme of army reform

coming from the St. Petersburg War Office has to work. We must remember how it must permeate through a thousand channels, and we must take account of the friction to be overcome from first to last, from the establishment of the new system of recruitment and organisation, the necessity of educating the exceptionally dense ignorance of masses of peasant soldiery, of penetrating the obstructive unintelligence of an immense body of officers brought up in the old creeds, and of setting in array great armies thoroughly versed in the new tactics. Looking at the matter in this light, it seems reasonable to infer that many years must yet elapse before Russia can be regarded in the light of Germany, Austria, and perhaps France, as a possibly aggressive Power of the first order. It is for many reasons interesting and important that we should understand how the autumn manœuvres are conducted in France, whether on the German system or on one improvised by the French themselves. It is not an indisputable fact, as so many people seem to think, that the German system is the only one to be followed with advantage. The Germans have arrived at an extraordinary degree of administrative and executive perfection, so that we may almost say they prepare for and make war by machinery. But we must remember that the genius of the nation has always tended in this direction. They were always drill-masters, always inclined to be pedants and machine drivers. The last great wars showed to what a perfection the machine had been brought, and what grand use might be made of it by leaders of pre-eminent ability. All this is true; but we have yet to see how matters would turn out were the able leaders on the opposite side; and we have yet to see how the machinery would stand the friction of reverses. We know that the elaborate drill-system of both Austrians and Prussians was shattered when it came in contact with the genius of Napoleon; and we are disposed to believe that a Napoleon would not now more than then allow himself to be chained to the wheels of any system whatever. What we really need in England is not the adoption of German methods, but the practical and intelligent application of those we have framed to suit a different organization. If our brigades and battalions were taken out twice a month into the country (wherever feasible), intelligently and systematically exercised in attack and defence, and practised in entrenching—which they never are—we should have no occasion for perpetually amending our field exercise regulations. We do not think battles are won because companies are two hundred and fifty strong, but they may very likely be won if we know how to manage our small companies. Battles are not won because captains of companies of two hundred and fifty men are left a certain initiative, nor are battles lost because captains of companies of seventy men are not called upon with so limited a number to exercise that amount of initiative. The German system is to give responsibility into the hands of leaders of large companies; ours is to give the direction of several small companies united in a half-battalion to the major of that wing. What seems to us to be required is that our system should be worked out in practice; not that the captains should be wondering what amount of initiative they are credited with, and the major hesitating whether and when it is his business to put in a word. But this is what at present we do see; and this leads to continual misapprehensions, the confusion of which is increased by an adjutant flying about with orders from the colonel to individual captains. When a regiment is operating by half-battalions the colonel becomes virtually a brigadier, and it is not his business to lead companies. Any one, however, who has witnessed field days at Aldershot may often see not only lieutenant-colonels commanding regiments, but even the generals mixing themselves up with the direction of companies. If we systematically worked out our own theories as the Germans do theirs in all their detail, we should have fewer lamentations over our antiquated tactics, and fewer prognostications o what dreadful things will happen "if we are ever pitted against European troops."

The principles on which autumn manœuvres should be conducted are in France and Germany theoretically identical. They have been laid down in black and white, and the wording of the French regulations is so similar throughout to the German, that it is plain the French could discover no more likely way to success than that of following as closely as possible in their rivals' footsteps. In one case, however, they have swerved from the beaten track, and have permitted themselves to start a little theory of their own. The theory is comprised in the last dozen words of a short paragraph. It is laid down that manœuvres between opposing forces—(*à double action*)—may be carried out in one of two ways—either a certain initiative may be left to the chiefs, *or else* the situations of the campaign and the alternations of the combats may be settled beforehand. The regulations, it is perceived, leave it optional which course shall be adopted. On the other hand, in Germany it is distinctly laid down that it is impossible to legislate for the shifting conditions and accidents of a campaign, and to prescribe the course which a battle shall take:—"It is out of the question," says Marshal Moltke, "to calculate with any precision the sequences in a campaign beyond the first meeting with the mass of the opposing force. Only a stranger to the military art fancies he detects in the various phases of a campaign the execution in all its detail of a plan laid out from the commencement, and followed undeviatingly to the end."

Since in Germany the utility of peace manœuvres between opposing armies is recognized in proportion as these resemble the realities of war, everything is done to lend them reality. It is laid down that, when once a general plan has been communicated to the rival leaders and a rendezvous given, nothing shall be told them as to their line of action in any of those circumstances in which, if it was real war, their conduct would have to depend on their own judgment and inspiration. So that in the peace manœuvres that element is introduced which is ever present in war—the element of uncertainty. And thus the generals not only acquire the habit of controlling large bodies of men in all kinds of situations, but are called upon for frequent exercise of moral and intellectual qualities of no mean order. Again, the cardinal consideration in the Prussian system being the perfecting of the infantry tactical unit, the company, the manœuvres are intended to afford those important personalities on the battlefield, the company captains, the opportunity of balancing their initiative with their responsibility, their power of separate action with the necessity of harmonizing for a common object. This is simply the logical result of the development of individual importance in the lower grades down to and including the private soldier owing to the introduction of arms of precision. We no longer talk of columns and masses—of which three parts were helpless both in attack and defence—being hurled against positions. The arm, the intelligence of *each* soldier is important now. We have only to think of the possible area of action covered by a company of two hundred and fifty men armed with the best breechloaders to see what power is now placed in the hands of the leader, and how necessary it is that his initiative should be on a par with his responsibility.

And now comes the question of what they are doing in France. Do they, according to their own regulations, allow generals of opposing armies complete latitude of action, or do they take advantage of the little paragraph quoted above to air the theory of fighting battles in a series of moves and counter-moves arranged beforehand? The answer to the question may be found in an admirable article by M. Amédée le Faure, in the *Nouvelle Revue* of October 1 of last year. "Since 1874," he says, "there have been manœuvres every year in four or five army corps. In every one of these twenty manœuvres the course of action has been determined on beforehand, *down to the smallest details*." Under these circumstances it is needless to pursue the question and inquire what initiative is allowed to inferior commanders. It must be a surprising intelligence which foresees all the chances of battle; for not only is it settled who is to be victor, but also that if anything does turn up which in actual war would rob the victor of his victory, such obstacle is to be treated of no account, or considered non-existent. If it has been laid down that such and such a village is to be assaulted, and taken by a couple of companies, the capture is to come about—no matter if in the teeth of a brigade with a formidable artillery which may happen to be in occupation. "But the brigade should not have been there," some one may say. It is a sufficient answer to reply, "But it *was* there." M. Le Faure states positively that on one occasion a general officer, perceiving that a battalion commander was throwing back two or three companies to ward off a possible sudden irruption of cavalry from behind the screen of a wood, dashed up at a gallop and exclaimed, "Now, you know well the enemy is about to surprise your left, and with what you are doing you will spoil all!" *You will spoil all!* The general was, however, quite right; the least exhibition of initiative, and, we may add, common sense, would of course destroy combinations devised on a kind of sliding scale of probabilities and without reference to possibilities of accident. In our manœuvres at home curious tactical feats are sometimes accomplished; but we never remember to have seen any so curious as one mentioned by M. Le Faure (and he says instances of like absurdities might be indefinitely multiplied), where two long lines of infantry were blazing into each other's faces at thirty paces, while a regiment of cavalry *filed between them* on its way to deliver a charge against a distant position on the flank! And of course, had the charge not been delivered, it would have *spoiled all*. The duty of the umpires, which in the German method becomes of so much importance, is by the French system reduced to an absurdity. And, in fact, this is so generally recognized, that though officers are deputed to act as umpires they are rarely, if ever, seen in the field.

What becomes then of the grand idea, which permeates the French as it does the German theory, that the manœuvres should present the "most faithful picture possible of real war"? What possible advantage is to be derived by any one who takes part in this elaborate dovetailing of movements? Does the general obtain experience in the handling of his divisions? Has he room for the exercise of judgment in unforeseen circumstances when all has been provided for? Do the company leaders learn to distinguish between a hardy initiative and daring the impossible when liable to be called on to refrain from desirable action or to act in the teeth of probability? And do the quick-witted French soldiers acquire confidence in their officers when they see them treated like dummies and perpetrating every kind of folly? Not the least harm resulting from a radically false system is the effect which the continually recurring absurdities produce upon all concerned. M. Le Faure says that the manœuvres come to be looked on as a farce; officers for the most part look upon the absurdities enacted as a joke, though a few preserve an expressive silence, while some are indignant at having to fill ridiculous situations, and all ask what sort of preparation is this for war, and what sort of generals is this parody of war likely to produce?

It would be interesting to know to what cause should be

attributed this strange state of things, that the permissive enactment conveyed in a short paragraph of a volume of regulations should have been taken advantage of by all, from the War Minister downwards, for the purpose of acting in direct opposition to the entire spirit of those regulations? First, we agree with M. Le Faure, the French as yet but imperfectly apprehend that the dominant characteristic of modern war is its decentralizing tendency. "Nous ne comprenons pas que la décentralisation militaire est forcée. Alors que les troupes sont éparpillées sur le champ de bataille, sans lien apparent entre elles, nous nous obstinons encore à voir l'armée concentrée dans la main de son chef, comme dans les actions d'autrefois." A second reason is not far to seek when we remember the tendency of French officialism and authority in every profession and department of military and civil life to *surveiller* the inferior grades as though they were just objects of suspicion, and to compass them about with minute precautions and restrictions. The system may be seen at work in every college and school throughout the country, in merchants' offices, at railway stations. A French friend of ours once remarked to the station-master of a large French railway station upon the superiority of the English system of allowing travellers to move about freely, instead of shutting them up as they do in France like sheep in a pen. "Mais, Monsieur," replied the official, evidently taking our friend for an Englishman, "vous ne connaissez pas les Français, ils se jetteraient partout"! And that is exactly what the authorities dread—that if any power of initiative were given to commanders of inferior grades, the troops would "be all over the place." A third reason may perhaps be found in the uncertainty which is felt as to the amount of progress realized in the instruction of each arm under a condition of things in great part experimental—on several important tactical questions there is much divergence of opinion both at home and abroad—so that a natural hesitation has arisen as to what amount of theory may be accepted as proved. While the Germans have had the experience of success to warrant their going hardily forward, the French have only the recollection of miserable failure; and it is not to be wondered at if they argue that what may be very suitable for Germans, may not be equally so for others whose genius, traditions, and character are widely different. We argue in much the same way at home. However much force there may be in this line of contention, there can be no manner of doubt as to the faultiness of a system which revolts the intelligence of all who follow it. The attempt to give logical development to every phase of a campaign or battle has been thoroughly tried, with the result of exposing alike its inutility and unsoundness. We believe General de Gallifet has had the hardihood lately to introduce in his own army corps measures tending to give greater reality to manœuvres which are intended to represent the realities of conflict; but such measures, when they involve an entire change of system, should be set on foot from above; and it is not too much to say that the whole army is waiting impatiently in the hope of obtaining at last from that arsenal of routine and pedantry—the War Office—some concessions to the general demand for reform.

THE WOES OF THE LORDS.

BETWEEN Lord Granville and Mr. Cremer the House of Lords must be acknowledged to be in a very bad way. The Foreign Secretary blandly refuses to give it anything to do; the probable representative of the Amalgamated Somethings protests against its activity. To the spirited resolutions of Mr. Cremer and his friends it is possible that the Lords need not pay any great attention. "The little tower with no such ease is won"; and we are afraid that Mr. Cremer and Admiral Maxse and Sir John Bennett may, in the words of another poet, "Resolve and re-resolve and die the same"—that is to say, under the same monstrous regiment of hereditary peers. For the point which strikes the excellent Mr. Cremer as an outrage on common sense—the hereditary constitution of the House—happens to be just the point which all reasonable people who have read history know to be the one of value. It is true that we live in remarkable times, and there is no knowing what folly the thirty and odd millions, mostly fools, may commit when a smaller number of influential knaves have managed to organize them. But organization is a game that two can play at, and Mr. Cremer has not the monopoly of resolving. Before the House of Lords disappears several things will certainly happen, and among those things the cracking of several crowns is probable. Let us hope that at least the exterior of the crowns of the good persons who mustered on Wednesday night at the Westminster Palace Hotel will long continue uncracked. The roll-call of their names does not, it must be confessed, suggest that the Democrats of the future will reverence the proceedings of Wednesday night along with the Grütli meeting and the Tennis Court oath. With one remarkable exception (and that a man who has done nothing but point a moral and adorn a tale about throwing away chances and making abilities worthless), the meeting was composed of simple nobodies, and, though an imposing list of persons who rank just above nobodies expressed sympathy with its objects, they carefully abstained from appearing at it.

The polite duel between Lord Redesdale and Lord Granville, on the supply of work furnished to the Lords, is a subject which has a good deal more importance, and perhaps it might have been treated rather less jauntily than Lord Granville treated it. It is only fair, however, to remember that there are many excuses for the Foreign Secretary. A mild revenge for the unpleasant figure he was made to cut when the Disturbance Bill was carried against him by a majority which would have been sufficient if it had been limited to those of his own political way of thinking, is humanly speaking, fairly permissible to him. Besides, it cannot fail to be borne strongly in upon Lord Granville's amiable mind that he is the only member of the whole Government who is allowed, or who allows himself, to make a joke. Most of the present Ministry, to do them justice, are wholly incapacitated by nature from the commission of this crime, and Sir William Harcourt, who might have been expected to be fertile in quips and cranks, has been grimly and ferociously in earnest since he was turned out of Oxford. A man who is always conspiring with Mr. Bright how to have the blood of some Tory has no time for polished witticisms. Besides, joking is the natural weapon of the minority, and Lord Granville occupies the position of leader of the minority beyond all doubt and question in the House of Lords. So he requests Lord Grey playfully to "convert him," and he is merry with Lord Redesdale on the recurrence of the latter's anxiety at the end of each Session for some reasonable adjustment of the work of the Upper House. Lord Redesdale, it seems, is of a different opinion as to the regularity of his proceeding, but it is not very easy to see that even if Lord Granville were correct in his facts, the reply would have been a particularly conclusive one. Because the majority of Governments are in the habit of mismanaging the public business, it is not extremely obvious as a consequence that any particular Government is justified in mismanaging it still more. It must be confessed, too, that the particular way in which, since Mr. Gladstone's illness, the business of the House of Commons has been managed has been decidedly remarkable. It would seem to others besides Lord Redesdale, that the enforced idleness of the Peers for the last fortnight, and the crush of work which will descend upon them in the ordinary course of things next week or the week after, are not so entirely fortuitous or unavoidable as Lord Granville makes out. The Government have for some days past been driving their horses abreast in a very curious manner in the Lower House. A little bit of Hares and Rabbits one day has been followed by a little bit of Employers' Liability the next, and then a slice of Supply has been sandwiched with the Indian Budget. The result of all this proceeding is that all the measures which the Lords have to consider will come upon them in a lump, so that proper discussion—let alone alterations which would have to come down again to the Commons—would be absolutely impossible. Ministers' exceptional privilege of going at once into Supply on Mondays only accounts for the Employers' Liability Bill having been taken on that day instead of on Wednesday, with the result of its getting up to the Lords three days earlier, and when their hands were completely empty. These were obvious tactics, but it was natural that Lord Redesdale and other Peers, who have no superstitious veneration for a very modern rule of the House of Commons, should be indignant at a muddle of which this one incident is a very inadequate explanation. The long letter which Lord Grey has addressed to his neighbour expresses this indignation generally, though most of it is devoted to the Hares and Rabbits Bill, which is known to be the special object of Lord Grey's aversion. It is not likely that the vials of Lord Grey's wrath will produce much effect, either on the Foreign Secretary or on his colleagues. They have pledged themselves, as a piece of brag, to do about twice as much work in the present Session as they ought to have attempted, and their immense majority in the Lower House enables them to carry out their pledge if they choose and as they choose. The slight and inconvenience inflicted upon the House of Lords has very much the air of being an arrow out of Mr. Gladstone's own quiver. That eminent statesman has always had a healthy sense of the principle that it is necessary δράσαντι παθεῖν, and a healthy readiness to make himself the instrument of the retaliatory suffering. The Lords are wicked men, and have thrown out a good Bill. *Ergo*, things ought to be made very unpleasant for them; and it is a capital way of making things unpleasant for them to keep them idling in town in the latter end of August, and then suddenly to set them to an impossible amount of work. On Thursday Sir William Harcourt tried in his more humble sphere to improve upon his leader's example, by suggesting that after Supply was done, and the Hares and Rabbits Bill sent to a better place, the House of Commons could compress all remaining business, Burials Bill included, besides Indian Budget, Ballot and other expiring law, and many other matters into the odd hours of the few days assigned to the Appropriation Bill.

Outsiders, however, may perhaps be allowed to regard the punishment of the House of Lords, the satisfaction of Mr. Gladstone's sense of justice, the provision of occasions of mild joking for Lord Granville, or even the obtaining by the Ministry of the triumph of passing a bumper programme, as not exactly the points to be chiefly looked to. Strange as it may appear to Mr. Cremer, there are persons not on the whole wanting in common sense who regard the discussions of practical matters in a Second Chamber, and especially in such a Second Chamber as the House of Lords, as peculiarly valuable. To these persons it seems that the importance of such a discussion has immensely increased by the recent changes in the constitution of the House of Commons. When that House was almost wholly composed of relations and nominees of peers or of country gentlemen, who differed from peers simply in not possessing the title, the revision of the House of Lords may have been less obviously use-

ful. Now, when our Parliaments consist in the Lower House of a considerable number of mere carpet-baggers, or, worse still, of delegates of local wirepulling associations, the criticism of the Lords is more valuable than ever. But it is evident that, in order to obtain it, proper time must be given for discussion. The plan of wheeling barrowfulls of measures into the House of Lords on the very eve of the closing of the Session, may be convenient for party reasons; it certainly is not convenient for the national interests. Nor did Lord Granville deign to show any cause against Lord Redesdale's demand why more measures were not originally introduced in the Lords. It is said that when this plan is adopted the Commons are sure to make so many amendments that the measure goes up again to the Lords practically as a new Bill; but this can be only when the Government is not intelligent enough to know its own mind, or strong enough to stick to it. On the other hand, the business aptitude of the House of Lords is so considerable, and its healthy dislike of mere talk so strong, that it may be trusted to give complicated measures the inevitable licking into shape in far less time than the Lower House, and generally in a more workmanlike manner. These sentiments would doubtless make Mr. Cremer's hair stand on end, but they are not the less justified by facts. Indeed, the intelligent gentlemen who met at the Westminster Palace Hotel—a poor substitute for the picturesquely named "Hole-in-the-Wall" of some years ago, which had a fine flavour of refuge from aristocratic tyranny—seem to have been not very clear as to their own intentions. Their chairman is said to have accused the House of Commons of obstructing as well as the House of Lords of mutilating and burking, so we suppose the House of Commons is to be abolished too. Sir John Bennett referred his hearers to Germany as a noble instance of a self-governing country; and if Sir John and his friends envy the construction which self-government has put upon liberty in Germany, there is of course nothing to be said. Mr. A. F. Robbins was enabled to state on the authority of Shelley that "we are many, they are few," which certainly is an encouraging and possibly an instructive fact, but seems to have little reference to the question. The citizens of Birmingham are many and the Six Hundred are few, yet Mr. Robbins would doubtless shudder at any one who should speak disrespectfully of the Six Hundred in consequence. Mr. Nias of Chelsea "would not give a fig for any reform of the House of Lords, but would sweep it away, the foundation being rotten," an insult calculated to make the blue blood of effete aristocrats rise to their withered cheeks. But of all these patriots we think that on the whole we prefer Dr. Pope of Sutton. There are many Suttons in England, and we do not know which of them enjoys the unspeakable advantage of being doctored by Dr. Pope. But the learned Doctor's grasp of political argument is surprising. We are, he said, "governed by Queen, Lords, and Commons; now two out of the three bodies were hereditary which was hardly fair." In short, as Mr. Weller observed of unduly watered grog, it was "unekal." It is exceedingly difficult to remedy Dr. Pope's complaints; for it is clear that if Her Majesty or the Lords were to cease to be hereditary, there would be two non-hereditary bodies, and that again "would be hardly fair." Perhaps if Dr. Pope would consider the favourite catch about the three estates of the realm his equanimity might be restored. We should imagine that Dr. Pope considers those three estates to be Crown, Lords, and Commons. But if he will accept the correct explanation, he will at once perceive that, while the Crown and the peers are hereditary, the Commons and the Bishops are not. Thus we have two for two, a result which ought to be infinitely comforting to Dr. Pope of Sutton. It need not be said that among all these follies we look in vain for the slightest evidence of any comprehension of the real historical and political bearings of the matter on the part of any speaker. Perhaps this was not to be expected. But it might have been expected that a Government which itself contains a considerable number of peers, might have been somewhat more alive to the value of the House of Lords, and somewhat more anxious to get its value out of it than is the case with the Government which Lord Granville represents. The expectation, however, has not been fulfilled, and until a year of sense comes round again to the average English elector it will probably remain unfulfilled.

THE TOWER AS A SHOW.

SOME of the daily papers during the past week have contained complaints of the way in which visitors are shown over the Tower. One gentleman, an American, even notices the unintelligent explanations of the warder to whose guidance he entrusted himself. It is true that the explanations given by one beefeater exceed those of another in stupidity, but it does not follow that either is very stupid. The American must have been peculiarly unfortunate, for we have heard of an enthusiastic Tower-haunter who, having visited the Tower upwards of twenty times, asserts that he has never met an unintelligent beefeater. The cause of the complaint may be that, not the warder, but the arrangement of the visitor's route, is stupid. If it were possible, visitors should be divided into two classes, those who want to do the sights in the Tower, or, as it used to be called, before the menagerie was removed, "the lions"; and those who want to see the Tower itself, to study its fabric, to survey its fortifications, and to endeavour by the pursuit of archæological inquiry to answer some of the problems which remain unsolved as to the architecture—the masonry in particular—of all periods of English history. It would not be easy, perhaps, to allow this privilege to every one; but it should be a recognized thing, and intelligent Americans should be aware of the possibility of obtaining a roving order of admission. Meanwhile we cannot protest too strongly against the proposal to make the Tower a mere museum. One of the most interesting things in a visit is the fact constantly presented to the mind that the Tower is still what it has always been, a fort in actual occupation. By no means the least interesting of the sights is that of the troops drilling on the parade ground, and of the armourers working in the stores. The continuity of the history is remarkable. As in the days of Gundulph and Flambard, as in the days of Edward III. and Henry V., so too in those of Queen Victoria, there is a garrison in the Queen's Tower "near London." To make the Tower a mere museum would be to destroy a great deal of this kind of association. That the defences of the Tower are, from a military point of view, worth little, makes it the more desirable that strangers and pilgrims from foreign countries should be permitted to walk round the outer walls; to inspect the recently uncovered remains of the Cradle Tower and some other bastions at the south-east corner; to examine those small portions of the masonry of the White Tower, which were spared at the "restoration" by Wren, and which, till lately concealed, have now, by the removal of a modern building, been open to view. Several years ago we called attention to the difficulty of obtaining an adequate idea of the architecture of the Council Chamber and other apartments in the Keep, and complained of the elaborate scheme of mystification to which the visitor was subjected in making his first entrance into the body of the building through a window, without any idea that the so-called Queen Elizabeth's Armoury was the crypt of the Chapel of St. John above.

To some extent anomalies like this have been remedied. The crypt of St. John is no longer falsified by mock mouldings in painted wood—mouldings which went, if they were considered genuine, to disprove the truth of Mr. Clark's assertion that no Norman zig-zag exists in the Tower. The room in question has been cleared out, and the window by which entrance was obtained has been restored to its original condition. The so-called prison of Sir Walter Raleigh is seen to consist of an arched opening, without any moulding or decoration; and access is possible to a second and still lower crypt. Although it is not very interesting to any one but a thorough-paced antiquary, it is perhaps a pity that this portion of the building is no longer shown. The removal of the annexed part on the eastern side is another alteration of very doubtful propriety. A building certainly existed here so long ago as the time of Elizabeth; it enclosed a narrow court, and was originally constructed, it is said, by Edward III., but had been of late years so completely altered that little remained which was not altogether modern. It has been cleared away, and one curious discovery has been made by this means. It is found that Roman brick has been used to a considerable extent in the foundations, and on a recent occasion its existence in this place was quoted as a proof of the truth of the absurd story that the Tower was built by the Romans. We must remember that two bastions of the city wall—that wall which had been erected under the Constantines and probably but little altered or repaired before the time of the Conqueror—were destroyed to make room for a portion at least of the foundations of the White Tower. It is obvious that, as the Normans had no objection to use the old material, a moment's examination of the supposed Roman building betrays the fact that, though the bricks are Roman, the mortar is Norman. We can never now determine how much of the ground upon which William built his castle is artificial. It is however, on record, and is not to be doubted, that he planted it absolutely across the city wall, and took into its precincts a small portion of the south-east corner of the City. To do this he rendered the City defences—those defences, that is to say, that the City could turn against the King—of little use, and although he did not absolutely violate the privileges which he had promised to "William the Bishop, and Geoffrey the port-reeve," he formed for himself a key which at any time he could turn in the lock. The eastern part of the Tower precinct, however, lay and lies wholly outside the City boundary. The land was probably already the property of the King as foreshore; and even if it was not left dry at every low tide, the earthworks and the ditch soon reclaimed it from the bed of the Thames. At a later time the ground still further to the east was gradually reclaimed and became the site of St. Catherine's Hospital. Strangely enough, as St. Catherine's Dock, it is now once more in its original amphibious condition. The question has sometimes been raised as to whether the Tower is in London or Middlesex, but from what has just been noted it would appear plainly that it is in both.

All such investigations as we have spoken of are, under the present arrangements for showing the Tower, entirely out of the question. The visitor is conducted through the Middle and Byward Towers to the gate in the Garden Tower, and thence without a pause to the Horse Armoury. He may as he goes along obtain considerable information from the guide, who must be excused if the want of intelligence of a large majority of his hearers tempts him occasionally to make himself rather entertaining than instructive. Like other showmen, he makes his little jokes, and no doubt repeats the same *impromptu* with every party. In the Horse Armoury one now finds considerable changes of arrangement. The upper chamber, called Queen Elizabeth's Armoury—really the crypt of St. John—is, as we have observed, no longer seen. The statue of

that bright and occidental star with her page now stands in the back row of the gallery. The heading-axe, the block, and the scavenger's daughter are huddled together at the end of the gallery, though they once occupied such conspicuous positions in Queen Elizabeth's Armoury. They have been supplemented by a neat and ingenious model of the rack. There is another point on which every one complains. Perhaps because of the disappointment which the present new look of the interior would occasion in the mind of the sentimental traveller, the Chapel of St. Peter is not shown. This is the less to be regretted, as we pointed out some years ago, because all the old bones have been dug up, and replaced in more "suitable positions"; the rugged pavement, so roughly laid down where Anne and Catherine and Jane lay side by side with Suffolk, and Northumberland, and Dudley, has all been removed, and the names of those personages so sadly associated have with a strange perversion of taste been worked into the gaudy pattern of an encaustic tile. There is little to complain of in the general restoration of the chapel, and the list on a brass tablet of the illustrious dead who sleep within its walls appears to be accurate. The Beauchamp Tower more nearly approaches the proportions of a museum, for into it, or rather into one chamber of it, have, by another most regrettable arrangement, been collected the touching inscriptions of the prisoners from all the adjacent walls. We are glad to know that this ill-advised proceeding has no longer the sanction of the authorities. The verses supposed to have been placed by Bishop Fisher on the wall of Bell Tower are still preserved in their place, and the eloquent bricks of the Prisoner's Walk, overlooking the moat on the roof of the Lieutenant's Lodgings, have not been disturbed. The visitor leaves the Beauchamp Tower, his mind somewhat puzzled by conflicting statements as to its age and as to the identity of the persons whose names appear on the walls, and proceeds to the new doorway cut through the wall of the Wakefield Tower. Here he inspects the Crown jewels, unless he is more interested in the architectural history of the building. If so, he will with much difficulty discover the Oratory mentioned by Mr. Clark and others—a recess on the eastern side, which has been thrown into the room, with a modern window of Mr. Salvin's driest and least mediæval pattern. This closes the round; and it must be admitted in reply to the American tourist, that although the visitor's mind is not put through so misleading a process as that undergone a few years ago, he has obtained a very inadequate amount of knowledge and a very limited idea of the extent and actual condition of the Tower of London.

SUICIDE.

MR. BUCKLE remarks in his *History of Civilization* that "the latest researches of M. Casper confirm the statement of earlier statisticians that suicide is more frequent among Protestants than among Catholics." In this he may very likely be right, but the observation must be limited to countries whose Catholicism is more than nominal, for France stands fourth on the list for its annual average of suicides, Denmark, Saxony, and Prussia taking precedence. It is no doubt true that the general average is considerably higher in the North than in the South of Europe, and the difference cannot be said to depend on conditions of climate, for in Russia the crime is infrequent, while on the other hand it is everywhere far more frequently committed in summer than in winter. And the natural conclusion to be drawn from an historical review, as will presently appear, is that its frequency or infrequency is mainly conditioned by religious or quasi-religious causes, whether acting directly or indirectly through the influence exerted on public opinion and legislation. But first a word may be said on the remarkable and unfortunately still growing increase of suicide in modern Europe. It is reported to have multiplied fivefold during the last century, till it has at length reached the startling figure of 60,000 cases annually, a fourth of which alone can fairly be set down to insanity. For it must be remembered that many other motives, besides a strict regard to fact, come in to explain what has been called "the charitable perjury of juries," such as the desire to secure the Christian burial of a suicide, and to secure his family from annoyance and from the loss of his property, which is still by law confiscated to the Crown in the case of deliberate suicide. And if we take into account the number of concealed or undetected suicides, and of ineffectual attempts, the annual average of 60,000 would probably have to be enlarged by half as many again. It is far higher, as might be expected, in towns than in the country, where the proportion of suffering is greater and there is less inclination to submit patiently to it. What would not be so readily anticipated is the early age at which the suicidal tendency manifests itself, and its survival in old age; middle life indeed appears to be comparatively exempt from it. Some two thousand children and a large number of old men over seventy destroy themselves every year. It may to some people be a greater surprise to learn that the spread of education has not served to diminish the number but to increase it; suicides are most common where every one is taught to read. That it would be much less common among women than among men might have been expected, and this is shown to be the fact. As to the means adopted for self-destruction, poisoning, which was the favourite method of the ancients, has gone out of fashion; hanging and drowning and shooting are most in vogue now, hanging and drowning alone covering more than two-thirds of the cases on record. That the over-excitement, sharp competition, and fret of modern life have something to do with this deplorable growth of what is called suicidal mania is of course obvious enough. But that the total or partial collapse of religious convictions is the underlying cause which gives potency to the more immediate pressure of suffering, despondency, or weariness of life, there can be little doubt. To be sure, religious enthusiasm has sometimes prompted self-destruction, as was exemplified in the fate of the early Christians who voluntarily courted martyrdom, or of the wretched victims crushed to death under the car of Juggernaut. But acts of this kind differ so essentially in character from ordinary suicide that they are most properly to be classed under the head of self-sacrifice, however perverse and even odious a form it may assume. Meanwhile the kind of influences which have mainly contributed to promote or to restrain the passion for self-destruction will be best inferred from a brief historical retrospect.

The condemnation of suicide among the ancients was halting and intermittent at best. Pythagoras expressly forbids it, on the ground recognized by Christian and theistic moralists generally in later times, that no one has a right to depart from the position where God has placed him, and Plato endorses his prohibition, though in a less absolute form. Aristotle's condemnation is based on the duty of citizens to the State. Plutarch considered it cowardly and unworthy of the dignity of man; the Neoplatonists condemned it as involving a perturbation and therefore pollution of the soul; Cicero condemns, but stultifies his censures by his exceptions; Marcus Aurelius wavers in his judgment; Seneca openly applauds, and the whole Stoic school followed him; Pliny more than approves. And popular opinion under the Roman Empire was, to say the least, entirely tolerant of suicide, which was freely practised, and not only by Stoics, who had Cato for their great exemplar. Lucretius, Cassius, Atticus, and Petronius Arbiter may be named as conspicuous instances. To Seneca the option of suicide appeared the one grand consolation under the tyranny of Nero; to Pliny it even constituted a superiority in the lot of man over that of the deity, that he could at any moment bring his existence to an end; Epictetus thought it cowardly to live on when life had become irksome from weariness or disease, and on this principle the poet Silius Italicus starved himself to death. In Stoical teaching suicide was not merely permissible but a virtue, and was deliberately practised as such. It has been justly observed that "the doctrine of suicide was the culminating point of Roman Stoicism," as illustrating the proud, self-reliant, unbending character of the true philosopher, whose boast it was to hope little and fear nothing. "Life and death in the Stoical system were attuned to the same key. The deification of human virtue, the total absence of all sense of sin, the proud stubborn will that deemed humiliation the worst of stains, appeared alike in each." And here too the Stoical, and indeed the Pagan conception of ethics generally, contrasted most pointedly with the Christian ideal which superseded it. It has been urged with literal accuracy that suicide is not expressly forbidden in the Bible, as it is in the Koran—for in this, as in many points, Mahomet borrowed without acknowledgment from the ethical code of Christianity—but it was generally understood by the ancient Jews, as afterwards by Christians, to be included under the prohibition of murder, though in the middle ages the persecuted Jews sometimes destroyed themselves by wholesale. The argument of Pythagoras and Plato was from the first reasserted and enforced by Christian teachers, who felt, to use the language of Madame de Staël, that "there is no crime by which men appear so formally to renounce the protection of God"; but they also insisted with great effect on the virtue of resignation and the remedial and sanctifying power of mental or bodily pain, which enter so largely into the ethical system of the early and mediæval Church. Two kinds only of suicide, or quasi-suicide, were for a while tolerated and sometimes commended, though both were condemned by the general verdict of later Catholic opinion from the time of St. Augustine downwards; the voluntary provocation of martyrdom already mentioned, and the self-destruction of Christian maidens or matrons in the imminent prospect of violation at the hands of their heathen persecutors. There are even canonized Saints, like St. Pelagia, whose merits are commemorated by Tillemont, among the women who thus destroyed themselves.

From an early period then suicide almost wholly disappeared within the Church, though it was revived from time to time in some fanatical shape among heretical sects, as by the Donatist Circumcellions of the fourth century and in the Albigensian "Endura"—or starving to death—of a later age. But moral teaching on the subject soon began to be reinforced by stringent enactments both of the canon and the civil law. No religious rites could be solemnized at the funeral of a suicide, and no masses offered for his soul; his property was confiscated, and his corpse subjected to various public and often grotesque indignities. Such legislation may be regarded as barbarous and revolting, but it is a mistake to say with Beccaria that it was useless, in the sense that it did not produce a strong deterrent effect on men's minds. Suicide at all events was rare during the middle ages, and mainly confined to exceptional occasions such as the Black Death in the fourteenth century; sometimes monks put an end to their lives from melancholy or despair. The Reformation itself does not seem at the time to have produced any great change either in theory or practice, but the revival of classical tastes and learning in this as in

other particulars naturally tended to recall the Pagan standard of ethics. Even Sir Thomas More allowed suicide in certain cases in his *Utopia*. But the great Pagan revival took place during the convulsive period of the French Revolution, when it was said that "the world had been empty since the Romans," and cases of self-destruction rapidly multiplied, while the laws against it were mostly abolished. The revolutionary epoch passed away, but it left permanent effects in the disintegration of traditional sentiment and belief; and during the last hundred years, as we have observed, there has been a steady increase of suicide, especially, as statistics clearly prove, in those countries which rank highest in intellectual culture and civilization. To say with a modern writer that it almost always springs from absolute or partial insanity, or from the last extremity of despair, is, we fear, to say more than is warranted by recorded facts, though it is probably true, for reasons it would take us too long to enter upon here, that an increase both of insanity and of extreme misery is a penalty inevitably attached to a highly developed phase of civilization. The advance of lax or sceptical views of religion has meanwhile materially weakened the chief counteracting influence, while the restlessness and fierce competitive spirit of the day are eminently unfavourable to the formation of habits of patient resignation and contentment, and that love of notoriety, which Cardinal Newman somewhere says is one of the great motive forces of modern life, is not without its effect over a feebler class of minds. To trace out the diagnosis of a disease is always easier than to suggest remedies, even had we space left for discussing them. But if there is no hope of recalling the old religious earnestness which afforded so powerful a corrective to such tendencies in former ages, it is much to be wished that those who have been most forward to discard it, would display equal energy in discovering some efficient substitute. "Killing no murder" is a principle the Nihilists have done their utmost of late years to revive, but self-killing is still generally looked upon as criminal in Russia. We cannot put back the shadow on the dial and emulate Russian obscurantism; it would be worse than idle to regret that the schoolmaster is abroad, but one may justly regret that his footsteps should be dogged by the suicide. There is a folly worse even than ignorance in the strange perversion of wisdom which deliberately adjudges life to be a mistake, and proceeds, sometimes when scarcely in its teens, to translate the conviction into a fatal reality.

RECENT RESTORATION IN ITALY.

MODERN Italians do not love their public buildings wisely. According to their lights, they take a very keen interest in them, and they are prepared to sanction almost any expenditure to preserve them. In this they are actuated partly by patriotism, partly by a rather childish desire, of which they are only half conscious themselves, that everything about the new Kingdom of Italy should be as new as its own title, and, above all, as different as it is possible to make it from what existed under the hated yoke of "the stranger." In those gloomy days the safe-keeping of public buildings was the last thing thought of. The decrepid religious corporations only patched their churches or their convents, at the cheapest possible rate; the petty princes had long felt too insecure to care to spend money on a capital they might be forced out of at any moment; and the Austrians were far too much occupied with the task of holding the country to have any leisure for public works. Under their rule the Ducal Palace at Venice was allowed to fall into such a state of disrepair that the water streamed through the roof, and they were compelled, in 1850, to execute a thorough repair of it. The result of all this neglect has been that the public buildings of Italy came into the hands of the new Government in a wofully dilapidated condition. Unfortunately, the same causes that had half ruined them had kept the Italian nation in a state of ignorance that rendered it incapable of appreciating the true value of its artistic inheritance. As a natural consequence, therefore, necessary repairs have been executed without due preparation, and by incompetent persons. The restoration of a building of the highest architectural and artistic importance is entrusted to a Company, as though it were a dock or a railroad; and when, after a drastic treatment, under which most traces of antiquity disappear, the work is pronounced complete, Italian critics are usually quite satisfied, provided always that the two great conditions, neatness and newness, have been fulfilled.

The treatment to which the church of S. Mark at Venice has been subjected is a notable example of this method, and though the protest that came from this country has at any rate delayed further interference with the west front, we fear that almost irreparable mischief has been done already. We have lately had an opportunity of examining S. Mark's and the Ducal Palace, and we found that whereas the architect who rebuilt the north side of the church some years ago was careful to confine his labours wholly to that side, and not to meddle with the west end of it, which enters into the composition of the great west front, the same course has not been followed on the south side. It would seem that by the time that work was undertaken, the rebuilding of the entire west front had been resolved on; for the lines of both plinth and parapet have been set out at a level considerably above that of the same members in the west front, and the portion entering into that front has been rebuilt. No attempt has as yet been made to join the old work to the new. A gap of two or three feet has been left in the parapet, and a similar, but smaller, interval between the old and new cornice resting on the lower range of columns. It is manifest, therefore, that these members cannot be left as they are at present; and besides, repairs are to a certain extent absolutely necessary along the whole façade; for many of the slabs of marble, especially the more modern ones, are fast crumbling into powder. Before long, therefore, it will be necessary to come to some decision respecting the course to be adopted, and, if we may conjecture the future from the past, it is not difficult to imagine what that course will be. A careful study of the south side, now completed, makes us fear that before long the whole west front will be enveloped in one of those elaborate scaffolds which reveal no secrets, and that when it sees the light of day again after perhaps two or three years' concealment, it will be in a condition that those who love and admire it now hardly like even to think of. Let us return for a moment to the south side. There the old marble slabs have all been taken down, and for the most part replaced by new ones, not from Oriental, but from Italian quarries, and of much larger size than the old ones. The result is to give a wholly modern appearance to the walls. The work is all most regular, for the slabs have been so arranged that their broad grey markings may pass alternately from left to right and from right to left; but at the same time it is most inharmonious. The soft warm colours, due to age acting upon a delicate material, are all gone; and in their stead we have a cold, glittering surface, from which the eye turns away, wearied and dazzled. Moreover, the surface of the columns has been worked afresh; the mosaics have been renewed; the lines of the original architecture all set exactly straight; and lastly, the pediment that backed the Capella Zeno (placed there in the beginning of the sixteenth century) has been pulled down and replaced by large flat slabs of green Susa marble, for which there is no authority whatever, while grave doubts have been expressed as to their durability.

We regret to have to state that the Ducal Palace is being restored in much the same spirit. Here, again, we are perfectly ready to admit that some repair to the stonework was urgently needed. The base of the column on the first floor, immediately above the Adam and Eve angle, had been crushed into small pieces, and the column had in consequence fallen out of the perpendicular. Several other bases had become more or less decayed. Many of the stones composing the frieze and the cornice, especially near the angle, were in an equally dangerous condition; and, in some few instances, the component pieces of the great circles of the arcade showed signs of falling. Many of the capitals, both on the first floor and on the ground floor, through the oxidisation of the iron tie-rods which had been imbedded in them at the period of their first construction, were split from top to bottom. To counteract this evil iron bands had been applied either round, or immediately beneath, the abacus, but these external supports were inefficient to prevent further decay, and were as unsightly as most of the restoration attempted during the seventeenth and eighteenth centuries. It was natural, therefore, that any work undertaken at the present day should include the removal of unsuitable additions made at a time when taste was at its worst. The present works were wisely prefaced by a thorough examination of the foundations all along the façade, both towards the sea and towards the Piazzetta. It was found that the lower range of columns rested on an embankment of stones, laid in regular courses, each projecting a few inches beyond that next above it. This substruction extended to a depth of about seven feet below the pavement, the height of which appears to be original, and rested, not on soil or sand, but on two layers of larch logs. These were perfectly sound, and the whole foundation was in such excellent order that the lower arcade need not have been interfered with at all, as is proved by the fact that the group of Adam and Eve has not been disturbed. In the upper part it would have been perfectly easy to take down the insecure portions and to reset the old stones, with the exception of the bases of the columns above mentioned. The old tie-rods having been removed, the capitals which their expansion had split might have been put together again. The task would not have been an easy one; but, considering the interest and importance of a building the preservation of which was solemnly decided upon after the great fire of 1577, it was quite worth undertaking. Instead of doing this the present authorities have entered upon a course of action the result of which will be to destroy the venerable appearance of the building even to the most superficial observer; and, as a natural consequence, to obliterate the historical and archæological interest of it. The work has been begun at one angle, and at present has extended to three bays on each side of it; but the whole of the façade towards the Piazzetta is included, and that towards the sea will probably be attacked at no distant date.

Beginning with the upper arcade, we find that, in addition to the necessary resetting and strengthening and making new the cornice and the bases of the pillars, the capitals and the shafts have been, as we think quite needlessly, replaced by new ones. The capital at the angle is old, but those of the four next to it on the Piazzetta side are new, and so is the shaft of the fifth column on the same side. On the seaside the capital of the first column from the angle is new, that of the second is old, and then those of the three next are new. Moreover, in all cases, the new work has been coloured grey, so as to look as much like the old as possible. This deliberate deception is wrong in principle, and the beauty of the ancient portions replaced by inferior modern work is great; but

the treatment of this upper arcade is praiseworthy by comparison with that of the lower one. There, as we have said, there was no imperative necessity for any reconstruction at all, but still the same system has been deliberately pursued. The celebrated capital at the angle, dear to all visitors to Venice for its intrinsic beauty, the capital which Ruskin calls "the most interesting and beautiful of the palace," is now no more. We saw the last of it a month ago, on a scaffold erected beside its old position, upon which it could be turned round and round at will, so that the workman who was copying it could proceed more easily with his work. We were assured that it was to be carefully preserved in a Museum somewhere; but of how much use will it be there, seen in a different position, and under different conditions from those to suit which it was designed? The sculptures on its eight sides represent the Sun and Moon, five planetary powers—namely, Mars, Venus, Mercury, Jupiter, Saturn—and lastly, the Creation of Man. Beneath and among these subjects was the most exquisite foliage—great leaves that bent over, and formed bases for the figures to rest upon. We have no space for a detailed description of the subjects; but we trust that the bare enumeration of them will be sufficient to indicate the nature and the importance of the old work which a modern artisan has been set to reproduce. Had the man selected been the finest sculptor of his time, he could hardly have been successful, for how could he have realized the feelings and the knowledge, and therefore, the intentions of the mediæval artist? But being what he is, a mere artisan, the failure is lamentable. His foliage lacks the living grace of the original, while in the figures he has been presumptuous enough to try to improve upon the old model, and, where the sculpture was broken away, has replaced it by his own fancies. As for the inscriptions, if they were difficult to understand before, they are utterly hopeless now. This desecration of a grand work is the more provoking because it was wholly unnecessary. With the exception of the abacus, the capital was not more broken than any other delicate sculpture that has stood for five centuries within reach of the hundreds who passed by it every day, and exposed to the action of the sun, the wind, and the sea. The shaft, too, a massive pillar that had suffered nothing worse than ordinary wear and tear, has been replaced by a new one, probably for no better reason than because the old one would not have harmonized with the modern capital. The next column—the seventeenth in Mr. Ruskin's enumeration—has been treated exactly like the eighteenth, with new figures, and new inscriptions copied from the accounts of what they once were, preserved by Zanotto and other historians. Here again a new shaft accompanies the new capital. In the next (the sixteenth) we find another new capital, but an old shaft; while the fifteenth capital is suffered to remain, but the shaft is new. Here, for the present, the work stops on this side; but we heard a rumour that it was intended shortly to extend it, and even to open out the five arches next to the Ponte della Paglia. As these were intentionally blocked after the fire in 1577 for the sake of additional security, the opening of them implies a complete rebuilding of that corner of the palace, and probably an interference with the old work far more extensive than that which the great architect who then saved the building felt himself compelled to sanction. On the opposite side, that next the Piazzetta, the same treatment will be found. The first capital on that side, the one next to the Adam and Eve angle, is described by Mr. Ruskin as—

> the most important, as a piece of evidence in point of dates, in the whole palace. Great pains have been taken with it, and in some portions of the accompanying furniture or ornaments of each of its figures a small piece of coloured marble has been inlaid, with peculiar significance; for the capital represents the arts of sculpture and architecture, and the inlaying of the coloured stones (which are far too small to be effective at a distance, and are found in this one capital only of the whole series) is merely an expression of the architect's feeling of the essential importance of this art of inlaying and of the value of colour generally in his own art.

This piece of elaborate symbolism, fuller, if possible, of the spirit of the time in which it was originally executed than even the preceding capital, and therefore more impossible to reproduce, has been copied after the usual fashion, marbles and all; and inscriptions have been cut into the abacus over the head of each figure after no better authority than the accounts of them preserved by former observers. The two capitals that follow next in order, and represent respectively a number of heads of animals and the principal inferior professions, have been treated in a similar manner. Copies as indifferent as those of the others, and coloured to look superficially like the old, have been set up in their room, and the venerable originals have been relegated to a gloomy lumber-room. The rest on this side are untouched for the present, but it will probably be their turn next, as many of them are in a bad state. They will then be copied after the same fashion, and another interesting piece of history will be obliterated, for most of them belong to the portion of the palace which was erected in the fifteenth century. The older work was ingeniously copied by the architect, and so long as the workmen were employed upon mouldings and tracery, it is difficult to detect the difference. In the sculptures of the capitals, however, the want of invention of the sculptors of that time makes itself felt; not merely in the execution, but in the subjects, most of which are copied from the earlier ones. The restorers, however, will make the whole set precisely similar.

Before we bring these remarks to an end we must mention that at Verona the tomb and statue of Can Grande della Scala have been "refreshed" in a style not much more creditable. As a general rule the tombs of the Scaligers have been most judiciously treated, protected from decay, rather than restored. Can Grande, however, has been scrubbed and scraped, his helmet has been adorned with bronze ornaments, and the edges of his tomb with lines of crockets, the authority for which is, we should imagine, very doubtful. There is yet one more work—happily as yet only projected—to which we wish to draw public attention. On entering the Arena Chapel at Padua we found an ominous scaffold set up against the south wall, and workmen engaged in making preparations. In the course of a conversation with their foreman, a very intelligent man, who had a genuine respect for the beauty and value of the building, we discovered that it had recently become the property of the Town Council, and that it was their intention to restore the west front according to the aspect of the building as shown in the fresco of the "Last Judgment." As for the paintings, we were assured that they were not to be restored, but only protected from the danger of falling down. As they have been there for five centuries, it is not easy to understand why they should be in any special danger at this particular time. Certain pieces of the border in the lower portion of the chapel, where nails have been driven in and visitors have picked off fragments of the plaster, have undoubtedly become loosened, but no special damage has been done of late years to the pictures. The damage done to them dates from a long time ago, and any attempt to repair it would be most disastrous. We were assured that there was to be no repainting, and let us hope that the assurance was warranted; but the work should be jealously watched, for there is no saying how far municipal zeal may go when once aroused.

SPECTACLES.

The hats, neckties, or boots of certain people seem as much parts of their persons as their noses or their whiskers; but no artificial adjuncts of the human body are so apparently identical with its nature as spectacles. We know men who seem to smile with their spectacles, to frown, to sneer, and even to eat with them. They are the most prominent features, so to speak, of their countenances, and we should miss them as much as we should miss their eyes or their ears. Indeed, it would almost seem indecent if they were to take them off. It never occurs to us for a moment that they were born without them, nor would it strike us as strange if we were to see a little spectacled face peeping out of their babies' cradles. We are, of course, referring to habitual, chronic, and incurable spectacle-wearers, and not to occasional offenders. There are probably but few civilized people of a certain age who do not make more or less use of glasses, and we might give a worse definition of our fellow-creatures than by describing them as spectacle-wearing animals.

An observant person can scarcely have failed to notice how much, and how variously the use of glasses alters the expression. With some people spectacles look what they are, mere instruments; but with others they seem part and parcel of their faces. Although the wearing of glasses always affects a person's face, we scarcely notice that they are worn by certain people. Yet there are cases in which the glasses are more conspicuous than their wearers, and we feel as if we were talking to the spectacles rather than to the human being behind them. The lenses seem to have life and spirit, and we should almost fancy we were committing manslaughter if we were to break them. Some people's spectacles have a peculiarly objectionable and impudent expression. Their wearers throw their heads back to look at one, and there is an unblushing and staring appearance about the whole arrangement, man and spectacles, which is decidedly offensive. We feel at a disadvantage, too, for it is impossible for the naked eye to assume a like air of intolerable impertinence. Then there are, on the other hand, abject spectacles, which seem cowed in one's presence. Their owners drop their heads, or slowly raise them on one side like ducks in a storm. There are strong and uncompromising-looking spectacles which it would evidently be unpleasant to dispute with, and there are weak-looking spectacles which one fancies might be easily bamboozled. There are some spectacles which look as if they wished they were not spectacles, and others which seem to take a pleasure in being spectacles, and to wish every one to be aware of the fact.

Like other things, spectacles have moved with the times. The glasses worn by our great-grandparents were something like spectacles. Those, for instance, which are depicted in the portraits of Sir Joshua Reynolds by himself, are instruments which few would be brave enough to use in these days. Their only living representatives are the heavy spectacles which are sold in out-of-the-way village shops; things with great wide rims made of tortoise-shell, silver, or brass, with double springs or holes at the ends by which to tie on the whole apparatus at the back of the head. The spectacles of fifty years ago were heavy cumbrous machines, almost circular, and broadly rimmed. They were about as formidable looking as the umbrellas of the same period. In former days little trouble was taken to make glasses becoming, because they were seldom used except for old and dim eyes, for the art of being short-sighted was not discovered until some time after the invention of spectacles. Among the rural poor, even now, glasses are seldom worn except by the old and dim-sighted. Among cottagers there seems to exist a superstition that the use of spectacles gives an air of respectability if not of piety to the wearer. An open Bible with a pair of spectacles laid across it is supposed to be conclusive evidence of the sanctity of the owner, and to be more than the hardest-hearted curate or district visitor

can resist. There is also something clerical in well-ordered spectacles. A parson may be most parsonic in his bearings and appearance, but his parsonification is intensely personified by the addition of spectacles. He has no sooner put them on his nose than he seems at once to have sprung from one to forty parson power. His views may have been sound before, but he looks much sounder when he has put on his spectacles. His influence is also much increased by this addition, for a creature all black cloth and gleaming spectacles is a formidable object, especially to children. Glasses again have their scholastic uses. There is a way of eyeing small boys through spectacles which is very awe-inspiring. Even looking over spectacles has been known to alarm people before now.

We have known charming women who wore spectacles, but as a rule, we do not consider glasses becoming to ladies. They are apt to give a semi-masculine, semi-scholastic, semi-clerical appearance to female wearers, which is not particularly prepossessing. A stern look is unpleasant in a woman, and glasses generally give this look more or less to the wearer. We are not fond of extremes, and although we are far from agreeing with the prudish old adage that a woman should never look straight into the face of a man, we are not fond of being deliberately stared at by a spectacled lady. Most ladies' noses are not very well fitted by nature for carrying spectacles, consequently when they use glasses they are obliged to throw their heads slightly back in a manner which appears, at first sight, a little supercilious. In most cases, of course, this appearance is unavoidable; but we fancy we have known instances in which women have gladly availed themselves of the excuse of spectacles for looking impudent. When women dislike each other they have a method of staring at one another through their spectacles which conveys more meaning than it would be possible for language to express. Glasses rarely increase the benignity of the countenance, but women can look through spectacles with a disagreeable expression which is beyond the power of the male sex. We have observed that many short-sighted ladies who never use glasses before men, make unblushing use of the most uncompromising spectacles when they are, or imagine themselves to be, exclusively in the company of their own sex. At any rate they will often merely use an eye-glass or *pince-nez* in general society, but wear regular spectacles among women. The *pince-nez* has become wonderfully fashionable of late years. If you place one alongside of a pair of spectacles on a table both appear equally harmless, but upon the nose the difference of effect is extraordinary. It is amusing to meet a person whom one has been accustomed to see in regular spectacles wearing a *pince-nez* for the first time. You hardly recognize your friend. The face looks but half clothed, and it wears a rollicking expression which is in strong contrast with the sobriety of its old spectacled days. In years gone by there were times when instruments existed somewhat similar in their construction to the *pince-nez*. They were even more hideous than the old spectacles, and were called by the euphonic name of "goggles." They stood much in the same relation to spectacles that the ancient blunderbuss did to the gun of the period.

Of late years the practice of putting children into spectacles has increased with alarming rapidity. It is melancholy to notice the number of children in the streets and schools with glazed eyes. Spectacling them may be a wholesome preventive; but it seems as if England would soon surpass Germany itself in its proportion of spectacle-wearing inhabitants. Happily there is still some shame left in our country, and there are people who are very shy about bringing out their spectacles. It is very entertaining to drop upon such as these unexpectedly. They snatch their glasses from their noses when discovered as rapidly as a monkey would do it for them, if he were to get the chance, at the Zoological Gardens; and there is a scuttling, a hiding, and a pocketing which is deeply suggestive of the guiltiness of the wearer's conscience. We have known people who would never fairly put their spectacles on; but would hold them the wrong way, or squint through them with the springs folded, and in fact do anything rather than incur the terrible odium of being supposed to "wear spectacles." This has always seemed to us almost greater affectation than the habit of wearing an unlensed eyeglass; and it has been quite a relief to turn to the simple—though in one sense rather complicated—honesty of an esteemed friend who uses blue spectacles, an ear-trumpet, and a respirator. We own that we prefer meeting him when walking rather than when riding or driving; for, although naturally a good-looking man, when armed with the above-mentioned weapons he is an object at which a horse might excusably shy.

It is a disputed point whether artists, in painting portraits of those who habitually wear glasses, ought to introduce in their pictures the spectacles of their sitters. It is objected that when they do so the natural expression is concealed or altered, and that spectacles give an unpleasant effect. It is further urged that an artist has the right to do all he can to present his sitter in the most favourable light, and that he may even portray him in some ancient costume instead of in modern dress with good effect. On these grounds there is doubtless a great deal to be said against introducing the spectacles. On the other hand, it seems desirable that a portrait should, of all things, recall the subject to our memories, and that it should present him to posterity as he appeared to his contemporaries; therefore, when a person habitually wears spectacles, it seems most reasonable to let him wear them in his picture. Again, if you make a man who is accustomed always to wear glasses take them off, his eyes feel uncomfortable and out of focus, so that if you paint them as they then seem the effect is anything but agreeable. Perhaps of all people spectacles sit least well on Asiatics; and, as they are often short-sighted, they are much given to the use of glasses. In general, savages regard spectacles as choice personal adornments. We lately heard of a native chief in South Africa whose sole "garmenture" consisted of an old dress coat, a pair of green spectacles, and a toothbrush stuck behind his left ear.

HOLIDAY-MAKING IN BELGIUM.

THE prolonged programme of *fêtes* with which Belgium commemorates its independence might argue excessive self-assurance in countries of greater pretensions. But Belgium has extraordinary advantages in getting up pageants of the kind, and an intelligent stranger, even were he constrained by circumstances to a three months' sojourn there, might easily find profitable ways of amusing himself in the interludes of the great national entertainments. As for the pageants, with their *mise en scène*, most of the cities lend themselves to them naturally. Historical associations crop up everywhere, linking the faded magnificence of the past with the revived and advancing prosperity of the present. The Flemish Low Countries have had more than their share of misfortune; their people have passed through trying vicissitudes; and what with foreign and civil wars, and fanatical religious persecution, not a few of their traditions are sombre enough. Even now there are cities like Bruges, that remain under the shadows of adversity amid the decaying memorials of their former splendour. But through all the changes of their eventful history we see the Low Countries in the reflection of a halo of wealth. Their rich soil yielded abundantly. The very titles of their mediæval princes and dignitaries—their Dukes of Burgundy and Brabant, their Counts of Flanders, their Prince-bishops of Liège—associate themselves with the pomp and ceremonial of spendthrift chivalry. As in Hood's ballad of "Miss Kilmanseggo and her Golden Leg," there is the ring of the precious metals in the whole romance of Flemish history, from the Battle of the Golden Spurs to the institution of the Golden Fleece. The badge of that famous order was a tribute by the Court to the wealth of the people who subsidized its profusion. The Flemish burghers, though they felt the hand of the oppressor, were the very men to thrive in the troublous times when might made right. Enterprising, indefatigably industrious, and frugal, they struggled for municipal independence as they held fast to their hoards, and any interference with their dearly-bought privileges was like thrusting the hand into a hornets' nest. When the chimes in their belfries rung the peals of alarm, the workmen of the guilds swarmed out into the streets, each ready to fall into his place among the fighting bands. Though they only "fought of a holiday," as the Syndic Pavillon says in *Quentin Durward*, yet the use of their weapons came almost as naturally to them as that of the special implements of their trades. There were no stauncher soldiers behind walls than those sturdy Flemish burghers; and they might have held their own more successfully than they did, had not an outbreak of turbulent audacity sometimes got the better of their discretion, and hurried them out into the open field to meet the seigneurs with their men-at-arms. But, though they suffered terribly in more than one pitched battle, and though their cities sometimes became the prize of the conquerors, it was by no means all dead loss when they came to strike the balance-sheet. The seigneurs learned to hold their formidable vassals in respect, and were all the more ready to treat with them for those feudal rights which could only be enforced by hard fighting. Those belfries that became the sonorous symbols of civic freedom had been erected in memory of the acquisition of rights purchased with guilders from the municipal treasuries. And, if the Fleming was frugal, he was neither mean nor miserly. Not only did he put his savings out to profitable purpose in extending his business, but he was capable of munificent expenditure both as an individual and as a chief of the community. The Low-country guilds were the most liberal patrons of the architects and artists who enriched their cities with the churches and *hôtels de ville*, the paintings, sculpture, and curious metal-work that are now the admiration of the tourist. The wealthy merchant might dress soberly and live plainly as a rule, but he prided himself on the quaint commodiousness of his private residence, beautified with carved ceilings and staircases; and he delighted to fill it with such treasures of art as Balzac catalogued in his "Balthasar Claes." He had his costly services of plate, displayed on grand occasions on his sculptured buffets; he had table-covers of the finest linen and hangings of the richest stuff of the East; he showed his taste for those delicately-carved ivory knick-knacks that were brought to him in his galleys from Constantinople or Genoa; and his wife had a pretty taste in laces. The ladies of the Flemish burghers, when their townsfolk were *en fête*, attired themselves with the well-fancied magnificence that had piqued the jealousy of an Empress. "What a city for the sack!" must have been the thought of many a dare-devil man-at-arms, on a visit to Bruges or Ghent, in days when the chivalry of the period was always out of elbows, and when the pay of the mercenaries was invariably in arrear.

It was more the fault of the citizens themselves, than owing to any alteration in the highways of commerce, that their prosperity dwindled with encroachments on their liberties. In place of acting on the sound Swiss maxim that union is strength, they were always quarrelling and fighting among themselves, provoking the

intervention of their common enemies. Then their wealth and weakness invited foreign tyranny, and made their country for long the cockpit of Europe. Yet that very disunion and decentralization with the long period of decay that landed them in comparative poverty are all in favour of the success of the present commemoration. There is no town of any consequence but has a history of its own; while among the chequered incidents of its rise and decline, there are events that its inhabitants may be proud to celebrate. And while the trade of a country is languishing and its national glories are under an eclipse, the works of demolition and reconstruction go on but slowly. Some of the most famous of the cities are museums of picturesque archæology, while others have become hives of busy industry. Yet even in these last you still come upon venerable relics which have been either carefully preserved or judiciously restored, as in the remains of the Bishop's Palace at Liége. Among the teeming industrial population of Ghent, there are imposing religious edifices that have suffered but slightly either from popular uprisings, from the fanatical Iconoclasts of the Reformation, or the reckless Vandalism of foreign garrisons. From where the traveller lands at Antwerp, under the shadow of the cathedral spire, he passes on from one object of admiration to another and from surprise to surprise. In Brussels, with its new quarters of parks and mansions, though the Ducal Palace, where Charles V. abdicated, has been destroyed by fire, the rage for fashionable improvement has never tampered with the Hôtel de Ville, the most glorious of all these Gothic municipal palaces, and it has spared the Grande Place, with its *broodhuis*, that witnessed the execution of Egmont and Horn. Even in dead-alive towns, such as Oudenarde and Ypres—Ypres had once 200,000 inhabitants, and now their number has fallen to 18,000—there are town halls, or cloth halls, in flamboyant Gothic, that will make a magnificently appropriate background to any "revivals" which may be devised on the vast, grass-grown *places* that could accommodate any conceivable crowd of spectators. Bruges with its deserted streets and its silent canals is the very abomination of desolation by comparison with its bustling neighbours of Antwerp and Ghent, and yet it has a fascination of its own for the intelligent traveller who may choose to devote a part of the holiday to the repose of quiet communing with the past.

But the charm of Belgium is in that variety of attractions which ought surely to satisfy the most many-sided of minds. If you are tired of the noise and the gaieties of Brussels, with its mimicry of Parisian manners and pleasures, you may retire for a week or so to the solitudes of Bruges, and there you are within easy reach of the *plage* at Ostend. At Ostend you are in the thick of a cosmopolitan Vanity Fair, where you may make lively acquaintances on the slightest provocation; where you may bathe in the mornings and dance in the evenings; lose your money at baccarat or *écarté* in the Casino; and trifle with the "native" oysters in the restaurants, at tables in windows looking out upon the sea. Or should you feel slightly out of sorts, after a course of dinners and dissipation in the capital, you may prefer a visit to Spa, which, as it is one of the oldest, is one of the brightest of European watering-places. The company that gathers to the Pouhon spring in the morning, or assembles in the Promenade des Sept Heures in the afternoon, is drawn even more than at most baths from the most mixed European society. For Spa is very accessible and charmingly coquettish in its aspect, and its water, moreover, has unmistakable virtues. Belgium, it may be added, varies as much in its scenery as in its dialects and languages. From the tame flats of the low-lying western provinces you pass through the highly-cultivated patches of market-garden and farm land of the small peasant proprietors in the centre, towards the south and east into landscapes that are strikingly picturesque. Nothing can be prettier than the look-out from the carriage-windows on the line of the Great Luxembourg Railway from Brussels, among rolling hills and rushing streams, and the ruins of many a castle and abbey. Some of the fortified heights and limestone precipices overhanging the wooded bends of the Meuse equal the most enchanting bits on the Rhine; while every summer-tourist bound to Germany must have admired the fresh green in the valley of the Vesdre, and the superb situation of Liége, as seen through the smoke of its gun-factories. It is a pity, of course, that in Belgium, as elsewhere, the exigencies of money-making and trade should have marred so much natural beauty. But, we must remember, it is in its lucrative industries that it finds the money to entertain its visitors at the *fêtes*.

THE ISLE OF WIGHT AND SOUTHSEA REGATTAS.

WE are not acquainted with the terms on which those much-coveted prizes, Queen's Cups, are given; but it may, we presume, be taken for granted that the cup which is annually fought for at Cowes is presented on the condition that none but yachts belonging to the Royal Yacht Squadron shall do battle for it. Other Queen's Cups are thrown open to all yachts; but it is impossible to suppose that the Yacht Squadron is distinguished from other clubs by discourtesy, and that its members keep what is by far their best prize for themselves. Doubtless there is a strict limitation on the grant of the cup, and the Squadron is obliged to appear inhospitable. It is much to be wished that it were otherwise, for the result is to deprive of almost all interest what ought to be the great yacht race of the year. Once this prize was won by that slowest of vessels, the *Hildegarde*, and it was taken this year by the *Formosa*, which has been beaten in every race she has engaged in all over the coast. She had, it is true, two very fine schooners and one very large one to contend against; but, even with the allowance which is given, a cutter has, generally speaking, a considerable advantage over schooners. It certainly seemed absurd that when such craft as the *Latona*, the *Florinda*, the *Miranda*, the *Vanduara*, and the *Samœna*, were in the Solent, none of them could sail for the Queen's Cup because their owners did not happen to be members of the Royal Yacht Squadron. What gratification can be derived from victory in a contest from which all the best vessels are excluded, and how much value would attach to the Queen's Cup at Ascot if it were made a strict condition that none but horses owned by members of White's should run for it?

In this season's race the *Formosa*, which was so fortunate in having no other cutters and no yawls to contend against, was further aided by the misfortune of the *Enchantress*, which, when leading, lost her jibboom and foretopmast. In this, however, there was nothing the least remarkable, as the accidental discomfiture of a rival often contributes to the success of a winning yacht. It is, moreover, by no means certain that, had all held, the *Enchantress* would have been able to save her time. The day after the unhappily narrowed contest which opened Cowes Regatta, came a real race, that for yawls and cutters of all clubs. The *Latona*, *Florinda*, *Arethusa*, *Samœna*, *Vanduara*, and *Arrow*, started, and with a light westerly wind had to beat to the Hurst markboat, and then to run to the Nab. The wind had drawn something to the south when the light-ship was rounded, and there was a reach back to Cowes. The flag-boat, was first passed by the *Latona*, but she was unable, to save her time, and the *Samœna* took a well-deserved first prize. The famous *Vanduara* was completely defeated; but it is to be observed that her chance in the sail was injured by an unfortunate error which was made at the start. On the day after this contest the race for the Cowes Town Cup, open to all rigs, took place. It was a curious and, to some yacht-owners and captains, a justly exasperating sail; but nevertheless a very exciting one. The contending vessels were the *Latona*, *Vanduara*, *Formosa*, *Samœna*, *Arrow*, *Miranda*, *Enchantress*, and *Egeria*. The course was to the Warner light-ship, and thence to the Lepe Buoy, twice round. Making for the light-ship with a north-easterly wind, the two first-mentioned vessels took the lead after a time and held it well. Off Cowes the wind was very light, and beyond it there was a westerly breeze, so that, oddly enough, in either channel vessels making for Cowes had the wind aft. The leading yachts, getting the westerly breeze first, drew very far to windward of the others; but off Cowes there was a dead calm, and on the return the whole fleet came together again. The great *Latona* was for awhile so absolutely becalmed that she seemed as if aground. After a tedious drift a light breeze sprang up, and again the *Latona* and *Vanduara* bade farewell to the rest, and sailed well away from them. When the coast close to Cowes was again reached, however, there was another dead calm, and for a second time the whole fleet came together. A light wind presently took the yachts past the roads, and the Lepe mark-boat was rounded with some difficulty. The *Samœna* was the winner; but though she sailed extremely well at times during the day, her victory was entirely owing to good fortune. One disagreeable incident in this race, to which attention has been drawn in *Land and Water*, requires notice. Towards the conclusion of the contest, the *Formosa*, being in a position to stop the *Miranda*, did so in every possible way, and then suddenly retired from the race. The *Miranda's* chance of the cup, which was a good one, was entirely spoiled by this; but we are not going to waste any pity on her, as she has gained so many prizes, that one, more or less, can be of small importance. The conduct of those in charge of the *Formosa* should not, however, pass uncondemned. For one yacht to hamper and worry another is unfortunately most common, and no vessel can be specially blamed for what all do; but for one yacht to hamper another, take away her chance of the prize, and then suddenly to give up is, if not unprecedented, unusual in the extreme.

The schooner race, which, as usual, concluded the regatta, was the best of those sailed. The course was round the island, as it was last year, and the vessels were sent to the eastward. The *Enchantress*, *Gwendolin*, *Waterwitch*, *Egeria*, and *Miranda* started; and, after a slow progress along the north-eastern shore, found a strong south-westerly breeze as they neared the Princess buoy. After this had been passed the *Egeria* and *Miranda*, for some unaccountable reason, went about and stood in to Sandown Bay, where of course they got less wind and tide than the others, which, better piloted, held on. The new schooner *Waterwitch*, which made her second appearance in this race, sailed admirably, and was lifted well to windward by the strong west-going tide. The pilots of the *Egeria* and *Miranda*, having, no doubt, enjoyed a charming view of Sandown Bay, found off Dunnose that their taste for the picturesque had to be heavily paid for, as the *Waterwitch* was far away from them. The splendid *Gwendolin*, surely the most beautiful of English schooners, fared very ill, as she stood out further than the *Waterwitch*, and sailed into a light wind, which much delayed her. On the stretch to the Needles the *Egeria* and *Miranda* gained on the new yacht; and in the run home they both, and especially the *Miranda*, came up to her rapidly, but at the finish she

was pronounced to have saved her time on the last-named vessel by 13 seconds, and was the nominal winner. We say nominal winner, because it was impossible in this case to place reliance on the official award. The authorities of the Royal Yacht Squadron were apparently unable to make up their minds as to the tonnage of the *Waterwitch*, and it seems clear that the time allowances were not the true ones for the course. Moreover, the timing was most eccentric. Any one who witnessed the termination of the race, and saw the *Gwendolin* and *Miranda* come in close together, must have learnt with extreme surprise that, according to the official statement, the latter was twenty-five seconds behind, or, to put it differently, that there were some three hundred feet of clear water between the two. Such careless work is not creditable to the Squadron, and exposes the club to suspicion which, though unjust, is not unnatural, and should never be allowed to arise.

In the short interval between the Cowes and Ryde regattas, yachtsmen were stirred by a totally unexpected excitement. The breeze which the schooners found outside the island was the first breath of a coming storm. The wind got up during Friday night, did not fall during Saturday, and on Saturday night rose to the force of a gale. There was confusion and disaster—fortunately unattended by loss of life—in the fleet anchored off Ryde pier. Several yachts dragged, and had to make sail. There were collisions, happily unattended by any serious injury, and a small vessel broke adrift and very narrowly escaped being carried against Ryde pier-head and wrecked. Another small yacht, the *Moonbeam*, was less fortunate. She also broke adrift, and was carried against the west side of Ryde pier, close to the landing steps. After bumping for a length of time which did credit to the strength of her build, she went down. As we have said, there was, happily, no loss of life, but this was more owing to good luck than good management. A yacht's boat was seen striving hard to aid the vessel which was driven past the pier-head; but, marvellous to say, the lifeboat never made its appearance. Some persons in cork jackets were seen on the pier, but these had, apparently, been put on for ornament only. The fact that there was not an effort to aid vessels in danger on this occasion is not a pleasant one, and we venture to suggest to the authorities of the National Lifeboat Institution, that they would do well to inquire how it was that no attempt whatever was made to launch the Ryde lifeboat on the night of Saturday, August 7.

Very literally, after the storm came a calm, for on Tuesday, the 10th, when the race for all rigs of the Royal Victoria Yacht Club was sailed, there was but a very light breeze, which towards nightfall died away completely. During a considerable portion of the race the *Miranda* and *Florinda*, sailing extremely well, led the fleet, but during a long drift in a calm, with occasional catspaws, which lasted through the entire night, there were many changes of position. Finally, however, the two vessels which have been mentioned regained the lead, and the *Florinda* took the first and the *Miranda* the second prize. As the yachts did not anchor until the morning, the Sailing Committee of the Victoria very wisely postponed until Thursday, the 12th, the race for the Town Cup, which was to have taken place on Wednesday, the 11th. For this the *Vanduara*, *Samœna*, *Arrow*, *Latona*, *Florinda*, and *Miranda* started in a smart breeze, and during the first part of the day there was a fine struggle between them. After a time, however, the wind became light and uncertain, and the race was deprived of some of its interest by the grounding of the *Vanduara*, which certainly has been singularly unlucky in the Solent. The *Latona* was first in; but the *Florinda*, which came next, was well within her time, and won the cup. For the race round the island, the which took place on the day after that just mentioned, there was a large entry, but the contest had little interest. Owing partly to good sailing, and partly to good fortune, the *Latona* got well away early in the day, and there was never much chance of her being caught. Some thirteen or fourteen minutes behind her came the *Samœna*, which has sailed very brilliantly in her native waters.

The Albert Yacht Club was more fortunate than the Yacht Squadron or the Victoria, as there was a strong north-easterly breeze on Tuesday and Wednesday last, when the prizes offered by this club were sailed for. The first day's race was marked by the extraordinary sailing of the famous *Florinda*. The course was from the Committee boat off Southsea to the Prince Consort buoy off Cowes, and thence to the Nab light-ship twice round. When the buoy was reached, the *Florinda* was first, though with no great lead; but, in the close-hauled stretch out to the Nab, she literally ran away from the whole fleet and tacked round the light-ship eight or nine minutes ahead of the nearest vessel. No doubt she was aided by one of those strokes of good luck which so often occur in yacht races; but, nevertheless, the performance was a marvellous one even for this yacht. She was of course an easy winner. In the second day's match the result was very different. The *Florinda* got a good start, but those in charge of her thought fit to engage in an utterly unnecessary luffing match with the *Latona*, in the course of which both yachts got close to the northern shore, and the *Florinda* touched the ground. The result of this foolish contest was to throw the two vessels astern of the rest, and for a while the *Miranda* led well. The *Florinda's* good fortune, however, did not desert her; and in the stretch from the buoy to the light-ship she was brought from a rear position well to the front by a strong puff of north wind, which enabled her to lay up some two or three points higher than any other vessel. When the Prince Consort buoy was rounded for the second time she just succeeded in heading the *Miranda*, and of course gained in the beat to the eastward; but the Wivenhoe schooner is not to be easily shaken off, and she kept steadily on the *Florinda's* weather quarter, and finally passed the flag-boat much within her time, and gained a well-deserved first prize. Both this race and that of the previous day were remarkably quick, and afforded a happy contrast to the wearisome drifts which are likely to be long remembered as having been the principal features in the Cowes and Ryde regattas of 1880.

REVIEWS.

BROWNING'S DRAMATIC IDYLS.*

THE second series of Mr. Browning's Idyls is far pleasanter than the first. In the newer poems there are no moral paradoxes of sentimental murder, or of sordid crimes impossibly expiated by voluntary submission to capital punishment. Five of the Idyls are versions of familiar old stories, and the sixth records an anecdote in the life of Clive which may perhaps be either authentic or traditional. The language, if rugged, is for the most part intelligible, and the expansion of a legend hinted at in three lines of the *Georgics* is pretty and graceful. A postscript, highly characteristic of the poet, might seem to be directed against facility and fluency of production. An imaginary writer is supposed to be praised by a shallow admirer for fertile readiness:—

> Touch him ne'er so lightly, into song he broke:
> Soil so quick receptive;

but the admiring critic is rebuked:—

> Indeed?
> Rock's the song soil rather, surface hard and bare:
> Sun and dew their mildness, storm and frost their rage
> Vainly both expend,—few flowers awaken there:
> Quiet in its cleft broods—what the after age
> Knows and names a pine, a nation's heritage.

The most voluminous among all poets of equal rank has in a long course of years produced some more perishable plants with a spontaneity which scarcely suggests the lonely pine "brooding quiet in its cleft." To skilful cultivation of the ordinary or rarer growths Mr. Browning has of late years devoted less and less attention. In one of the Idyls, having occasion for a rhyme to *between us*, he supplies its place by an unnecessary Latin word involving a deliberate false quantity:—

> Ten long years your march has moved—our triumph—(though e's short)—
> *hactĕnus.*

Having apparently become aware that the whole idyl is composed in a metre difficult to scan, and impossible to read with any kind of melody, the poet coolly proposes that it should be sung, and he adds a few bars in musical notation to facilitate the process. Prose, as in the case of anthems, may be set to music and sung, but barbarous metrical dissonances are not cured by artificial intonation. The story of typical ingratitude belongs to more than one age and one country. A magician whom Mr. Browning calls Pietro of Abano bestows by his art wealth on an adventurer who courts his favour, and, applying after ten years for assistance, he is put off with a request that he will confer power, which also follows in due season. After another ten years, the applicant, now the Emperor's Minister, wishes to exchange influence in the State for promotion in the Church, and accordingly his patron makes him Pope. A final appeal to the gratitude of the upstart is answered by a threat of committal to the Inquisition, and Pietro of Abano shuts in his face the door which he had held open while he listened for a minute to the first prayer for assistance. In the Spanish version, the wizard who had ordered two chickens for dinner, calls to his cook to roast only one. The confusion of time in dreams must have suggested the form of an essentially popular satire. Mr. Browning tells the story with spirit and humour, but he has never been more outrageously reckless in metre and rhyme. One stanza may be selected almost at random, to illustrate the wilful employment by a master of language of the lowest and dullest doggrel. Simplicity is sacrificed, not to beauty or ornament, but to perverse ostentation of what might in another writer be deemed helpless awkwardness.

> As he stood one evening proudly—(he had traversed
> Rome on horseback—peerless pageant!—claimed the Lateran as new Pope)—
> Thinking, "All's attained now! Pontiff! Who could have erst
> Dreamed of my advance so far when, some ten years ago,
> I embraced devotion, grew from priest to bishop,
> Gained the Purple, bribed the Conclave, got the Two-Thirds, saw my coop
> ope,
> Came out—what Rome hails me! O, were there a wish-shop,
> Not one wish more would I purchase—lord of all below!"

No fragment of Mr. Browning's genius is needed to produce such rhymes as *traversed* and *have erst*, *new Pope* and *coop ope*, *bishop* and *wish-shop*. Some of his parodists have accomplished in imitation of him similar feats of ingenuity with the excuse of being intentionally absurd. The lumbering and irregular accentuated trochaics are almost worthy of the perverse rhymes with which they are pointed. Some of Mr. Browning's metrical compositions

* *Dramatic Idyls.* Second Series. By Robert Browning. London: Smith, Elder, & Co. 1880.

are duller and more unintelligible than "Pietro of Abano"; but not one of the number contains worse verses. Whether the music redeems the faults of the libretto is not a question for literary criticism.

Another poem in *terza rima*, which of all alien metres is perhaps the least manageable and least agreeable in English, tells the old story of a bad wife being more than a match for Death, who is here by a novel mythological contrivance identified with Satan. The son born of his penal union with a human wife is brought up as a physician; and the power of seeing Death, invisible to others, impending or remote from each patient, enables the practitioner to acquire reputation and wealth. Finding it impossible to persuade Death to leave the pillow of the Emperor, who had offered his daughter in marriage as the price of a cure, the demi-demon sends for his mother who frightens Satan away. Taking warning by the parental example, he then refuses to marry the Princess. The tale has the merit of embodying a jest at the expense of women which amused former unsophisticated generations; and it is also to be commended for the absence of a moral. If the verses were smoother and sweeter, the genial humour which befits the relaxation of genius would be not unattractive. A subtler meaning is contained in the story of Mulèykeh, which is also more poetically told. The Arab Hóseyn owned an unequalled mare, though he had been impoverished by paying his share of blood-money due from his tribe. He has no longer any camels, but he is contented with his lot:—

> "God gave them, let them go! but never since time began,
> Muléykeh, peerless mare, owned master the match of you,
> And you are my prize, my Pearl: I laugh at men's land and gold."

His tribesmen and strangers hold that pity would be wasted on Hóseyn, "but lavish both on Duhl, the son of Sheybán, who withers away in heart for envy of Hóseyn's luck." The envious Duhl in vain offers for the Pearl the price of a thousand camels; and he afterwards appeals with as small result to the generosity of the fortunate owner on the pretext that his son is pining and dying through covetousness of the mare. A third attempt is more successful. Duhl steals Muléykeh from Hóseyn while he sleeps with the rope of her headstall round his arm:—

> And, loose on his left, stands too that other known far and wide,
> Buhéyseh, her sister born: fleet is she, yet ever missed
> The winning tail's fire-flash a-stream past the thunderous heels.

Duhl looses the headstall and springs on the Pearl, and instantly Hóseyn follows on Buhéyseh. Stride by stride he gains on the robber, and in another bound he will reach him:—

> She is near now, nose by tail—they are neck by croup—joy! fear!
> What folly makes Hóseyn shout "Dog Duhl, Damned son of the Dust,
> Touch the right ear and press with your foot my Pearl's left flank.

At the touch, and hearing the voice of her master, Muléykeh gave a leap and "vanished for evermore," while her owner returned weeping to his tent. His friends come round him and justly censure his folly:—

> "To have simply held the tongue were a task for a boy or a girl,
> And here were Muléykeh again, the eyed like an antelope,
> The child of his heart by day, the wife of his breast by night!"
> "And the beaten in speed!" wept Hóseyn: "You never have loved my Pearl."

The sentiment may be fantastic, but it serves well for a symbol of disinterested and objective affection. In imagination, if not in actual life, the faultless excellence of the beloved object may be valued more highly than possession. Of those who have treated the legend Mr. Browning has best discerned its capabilities. The point of the poem of "Clive" consists in a more paradoxical fancy. An early friend of Clive sitting with him a week before his tragical death, asks him when in his own opinion he displayed the highest courage. Lord Clive answers that he will say instead when he felt most fear; and he proceeds to tell the story of a duel when he was young and obscure with an officer whom he had accused of cheating at cards. Either combatant was to deliver or reserve his fire at his choice; Clive had fired and missed; and his adversary demanded an apology with the muzzle of his pistol touching Clive's head. The idiomatic answer was "You know you cheated . . . fire and go to Hell." The conscience of the gambler was touched; he confessed his delinquencies and disappeared. Clive threatened the spectators with death if they at any time revealed the scandal. The fear which he expressed appeared to have been lest the wrongdoer should affect magnanimity by sparing his life. There is perhaps a false antithesis between physical fear and apprehension of discredit, but a hyperbolical expression of the highest courage may be tolerated in fiction.

By far the best of the former collection of idyls was that of Pheidippides, the Athenian runner, who on his return from a fruitless mission to Sparta encountered the god Pan, and bore from him to Athens a sprig of fennel (*marathus*) as a token of victory. Once more dispatched by Miltiades to Athens with the tidings of Marathon, Pheidippides died as he told the Assembly of his victory. The short poem of "Echetlos" in the present volume refers to another legend of Marathon, in which an unknown hero, dressed as a rustic, performed marvellous feats with a ploughshare, and disappeared when the battle was over. The Oracle, on inquiring for his name, answered with more good sense than poetical aptitude:—

> "Care for no name at all!
> Say but just this: We praise one helpful, whom we call
> The Holder of the Ploughshare. The great deed ne'er grows small."

The priestess, in spite of her inspiration, seems to have been at a loss to fill up the verse, which was probably a hexameter in the original. The pretty tale of Pan and Luna is suggested, as has already been said, by a passage in Virgil, who, according to Conington, borrowed the fable from Nicander. The episode in the Third Book of the *Georgics* is introduced to relieve a prosaic statement of the signs by which a purely white stock may be secured by sheep breeders. It was with fleeces snowy as these that Pan cajoled the Moon:—

> Munere sic niveo lanæ, si credere dignum est,
> Pan deus Arcadiæ captam te, Luna, fefellit,
> In nemora alta vocans: nec tu aspernata vocantem.

The fancy may perhaps have been derived from white patches of moonlight seen in openings of the woods. Mr. Browning, who speaks with authority in such matters, prefers to believe that the Moon, too visible in a clear sky, sought to veil her beauties in a fleecy cloud, craftily placed to delude her by Pan. The mention of wool in the Third Book of the *Georgics* justifies the theory that the seeming cloud was of a more tenacious substance:—

> But what means this? The downy swathes combine,
> Conglobe, the smothery coy-caressing stuff
> Curdles about her. Vain each twist and twine
> Those lithe limbs try, encroached on by a fluff
> Fitting as close as fits the dented spine
> Its flexile ivory outside-flesh: enough!
> The plumy drifts contract, condense, constringe,
> Till she is swallowed by the feathery springe.

It will be seen that, in dealing with a purely poetical subject, Mr. Browning abstains from thrusting on unwilling readers the grotesque rhymes and ill jointed verses which he thinks good enough for a mediæval magician. It might perhaps be hypercritical to remark that the modern poet deviates from his original by turning into a snare Virgil's bait or bribe. The newest version does more credit to the character of the Moon; but her latest votary declines to invent an apology for her further conduct:—

> Ha, Virgil? Tell the rest, you! "To the deep
> Of his domain, the wildwood, Pan forthwith
> Called her; and so she followed"—in her sleep,
> Surely?—"by no means spurning him." The myth
> Explain who may—Let all else go, I keep
> —As of a ruin just a monolith—
> Thus much, one verse of five words, each a boon,
> Arcadia, night, a cloud, Pan, and the moon.

On the whole, in the present volume Mr. Browning has tested less severely than usual the inexhaustible loyalty of his genuine admirers. They resent with reason his rough verses, his outrageous rhymes, which have now reached the climax of badness *in hactēnus*, and in many instances his choice of revolting subjects; but intellectual vigour is never wanting; and at his worst Mr. Browning is deliberately bad. If he occasionally descends to doggrel, he is like a grown man amusing himself with baby language, and at any moment he may choose to resume a fitting and masculine style. It is scarcely safe to skip when he may, while the attention of the reader is suspended, suddenly digress into rich and nervous poetry. The tiresome jingle of "Fifine at the Fair" ends in four stanzas of Mr. Browning's finest poetry, since separately published under the title of "The Householder." The second series of *Dramatic Idyls* exhibits one of his peculiar gifts in his discernment of the poetic use which may be made of popular stories. He has condescended on this occasion to dispense with the use of cypher, which has often in default of a key rendered his poems unmeaning to ordinary readers. There is no reference in the Idyls to undisclosed processes of thought or to unfamiliar passages of history. In the story of Pan and Luna the metre is regular and polished; and the versification of "Doctor ——," if not pleasant to the ear, is studied and regular. On the whole, it is well to be grateful to a poet who either does well or could do better if he chose. It has been said that all faults may be forgiven except those which could not have been avoided. Mr. Browning's artistic sins are almost always gratuitous and wilful.

SACRED BOOKS OF THE EAST.—THE ZEND-AVESTA.*

PROFESSOR MAX MÜLLER has brought out another batch of his *Sacred Books of the East*. Two volumes—or, as each is marked Part I. we should perhaps call them half-volumes—relate to the old Persian religion, the religion known to us as that of Zoroaster, which after a prolonged and chequered existence, still survives among the Parsís in India and a few small communities of Fire-worshippers in the neighbourhood of Yezd in Persia. The third new volume relates to the Hindus. Of the two volumes on the Zoroastrian religion, the first (Vol IV. of the Series) deals with the Vendidád, belonging to the older canon of Zend scripture; the second comprises Pahlaví texts, of a later, but still very ancient date. This translation of the Vendidád has been made by Mr. James Darmesteter, who prefaces the work with a long and able Introduction. The oldest canon of Zoroastrian scripture has for more than a century been known among us as "Zend-Avesta," and that term is used in this volume, although it is pretty clearly shown to be a misnomer. It is too useful and familiar, however, to be discarded. The Zend-Avesta is divided into two parts—"The Avesta, properly so called, contains the Vendidád, the

* *The Sacred Books of the East.—The Zend-Avesta.* Part I. *The Vendidád.* Translated by James Darmesteter. Oxford: at the Clarendon Press. 1880.

Vispêrad, and the Yasna. The Vendidâd is a compilation of religious laws and of mythical tales; the Vispêrad is a collection of litanies for the sacrifice; and the Yasna is composed of litanies of the same kind, and of five hymns or Gâthas written in a special dialect, older than the general language of the Avesta. The Khorda Avesta or 'Small Avesta' is composed of short prayers, which are recited . . . . at certain moments of the day, month, or year, and in presence of the different elements."

In a previous number of the *Saturday Review* (September 7th, 1878), a brief account was given of the dispute which long raged among Orientalists as to the existence of any such language as that called Zend; for it was maintained by several men of great repute that the language was as spurious as the doctrines it recorded were ridiculous. The existence of this language is now universally admitted, although it has no right to be called Zend. The term Zend means "commentary or explanation," and was the name of the comment which accompanied the Avesta, "the law" or the word. What name the language was known by in ancient times has not been discovered; but "it ought to be named the Avesta language," just as, in default of knowledge of the name Hebrew, the language of the Old Testament might be called the "Bible language." Though the name of the language is unknown, its affinity is clearly established. It is a twin sister of Sanskrit, and the common source of the two languages is proved not only by an unmistakable similarity, but by the many myths and semi-divinities which are common to the oldest writings in both these languages. In what country and from what language these two great Aryan tongues arose is, and will probably long remain, a matter for conjecture. Mr. Darmesteter endeavours to discover the country in which the writings of the Avesta first assumed shape; and the conclusion he comes to, though upon very abstruse and hypothetical reasoning, is that

> The original texts of the Avesta were not written by Persians, as they are in a language not used in Persia; they prescribe certain customs which were unknown to Persia, and proscribe others which were current in Persia. They were written in Media by the priests of Ragha and Atropatene, in the language of Media, and they exhibit the ideas of the sacerdotal class under the Achæmenian dynasty.

The interpreters of the writings in the Zend or Avesta language labour under great disadvantages. If grammars and lexicons of this language ever existed, they have not come down to modern times. Translators have nothing to work upon but the texts themselves. The texts have been attacked from two sides, and "the battle of the methods" still rages. The "traditional school" seeks to explain them by the writings of later times in other languages; the "comparative school" approaches them through the old Vedic Sanskrit. According to this school "the Avesta and the Veda are two echoes of one and the same voice, the reflex of one and the same thought; the Vedas therefore are both the best lexicon and the best commentary to the Avesta." At the head of the former school stands Spiegel, and Burnouf was the great founder of the latter. It is obvious that neither of these methods can be implicitly trusted. Religions undergo many changes in the lapse of centuries, primitive ideas drop out of knowledge, some are enveloped in mystical or fanciful interpretations, and some develop new forms in accord with the thoughts and feelings of each age. Like all things of this world, religion grows or dies. Tradition therefore can give no certain and satisfactory interpretation of the compositions of a far distant age. On the other hand, comparative philology can do much, but cannot wholly accomplish the work. There is no disputing the close affinity of the Vedic Sanskrit and the language of the Avesta, but these two languages are far from being identical. The languages must have existed apart for a long time before the Vedas and the Avesta were composed. They show a great difference in the spelling of words which were once identical, and if the forms of words changed, their significations could hardly have been exempt from variation. Indeed we know that there were great divergences, of which the two stock examples are convincing proofs. Sanskrit *deva*, a god; Zend *daêva*, a demon; Sans. *asura*, a demon; Zend *ahura*, a god. Instead of "prolonging the battle of the methods," the wisest and the surest course will be to join forces, and to recognize the fact that the two methods may greatly assist each other. Mr. Darmesteter does not describe his own method of translation, but he counsels the disputants to have respect for and to use the discoveries of each other—"their common work," he says, "must be begun by the one and completed by the other." This has evidently been his own course of proceeding.

The period when the Zend texts were collected and formed into the Avesta has not been ascertained, and there is no evidence to lead to a satisfactory conclusion on the point; but it seems possible to trace a Zoroastrian literature back to the third century before Christ; and although some portions of the Avesta are evidently later in time than the rest, "no part of them can belong to a later date" than the fourth century A.D. The date of the collection must have been long posterior to the composition of the component parts. How and when these productions first made their appearance is a matter for pure speculation, and will probably ever remain so. When Zoroaster lived no one knows, and, according to Mr. Darmesteter, "the question is whether Zoroaster was a man converted into a god or a god converted into a man." "All the features in Zarathushtra [Zoroaster] point to a god, [though] pre-existent mythic elements may have gathered around the name of a man, born on earth, and by-and-by surrounded the human face with the aureole of a god." Zoroaster is thus resolved into a myth, the personality which has been present to the minds of men for many centuries is shadowy and unsubstantial; the name is appropriated to a "titulary lawgiver," and it may have been applied to more than one. The term "Zend" has been deposed as the name of the Avesta language, but will any amount of speculative ingenuity ever efface the individuality of Zoroaster?

The religion of Zoroaster, or Mazdeism, as, according to the new lights, we ought to call it, has from the days of Herodotus been a subject of attention and speculation among the philosophers of the West. "There has been no other belief in the world," says Mr. Darmesteter, "that ever left such poor and meagre monuments of its past splendour"; and the more we learn of these "monuments" the less is the estimate of their value. Notwithstanding this, and the apparent paradox of the statement, they will probably long continue objects of interest and study. The two great leading principles of this religion, Ormazd and Ahrimán—one the author of all good, the other the cause of all evil—are personifications of the good and the evil which man sees to be constantly in conflict in the world around him and warring in his own nature. Mr. Darmesteter says:—

> Magism, in its general form, may be summed up as follows:—The world, such as it is now, is twofold, being the work of two hostile beings, Ahura-mazda [Ormazd], the good principle, and Angra Mainyu [Ahriman], the evil principle; all that is good in the world comes from the former, all that is bad in it comes from the latter. The history of the world is the history of their conflict, how Angra Mainyu invaded the world of Ahura Mazda and marred it, and how he shall be expelled from it at last. Man is active in the conflict, his duty in it being laid before him in the law revealed by Ahura Mazda to Zarathushtra [Zoroaster]. When the appointed time is come a son of the lawgiver, still unborn, named Saoshyant, will appear; Angra Mainyu and hell will be destroyed; men will rise from the dead; and everlasting happiness will reign over the world.
>
> There were two general ideas at the bottom. First, that there is a law in nature, because everything goes on in a serene and mighty order; and, second, there is a war in nature, because it contains powers that work for good and powers that work for evil; there are such beings as benefit man, and such beings as injure him; there are gods and fiends."

This, no doubt, is a fair philosophical exposition of the doctrines involved in this religion; but it may well be questioned whether the great body of the old Zoroastrian worshippers realized more than a general conception of the existence of good and evil, gods and fiends. In this part of the Introduction the author compares the deities and demons of Mazdeism with those of the Vedas, and explains all or nearly all as pure myths suggested by the various phenomena of nature. This is all very clever and very alluring, but not entirely convincing. There are many identifications and explanations which seem plausible and worthy of acceptance; but on considering the whole, incredulity is aroused, and asks if it is possible that the early professors of this religion knew that their creations embodied the ideas and myths which are now attributed to them. As commentators have often found in texts recondite and mystic meanings which probably the writers themselves never conceived, so the modern investigators into the springs of ancient religions bring to bear upon them the accumulated knowledge of centuries, and may discover more in them than was ever known or conceived by the men of old time. These mythical explanations are almost entirely speculative; they certainly rest more upon imagination than reason, and while they amuse the fancy, they frequently fail to satisfy the mind. There are many analogies between the Veda and the Avesta; but analogies are frequently deceptive, and the greatest caution is necessary when analogies are made to explain each other. As an example of Mr. Darmesteter's method of treating these subjects, we cite the following, not because it is the most apposite, but because it is one of the least technical, and will bear separation from the context:—

> The single elements of Mazdeism do not essentially differ from those of the Vedic and Indo-European mythologies generally. Yet Mazdeism, as a whole, took an aspect of its own by grouping these elements in a new order, since by referring everything either to Ahura Mazda or Angra Mainyu as its source, it came to divide the world into symmetrical halves, in both of which a strong unity prevailed. The change was summed up in the rising of Angra Mainyu, a being of mixed nature, who was produced by abstract speculation from the old Indo-European storm-fiend, and who borrowed his form from the supreme god himself. On the one hand, as the world battle is only an enlarged form of the mythical storm fight, Angra Mainyu, the fiend of fiends and the leader of the evil powers, is partly an abstract embodiment of their energies and feats; on the other hand, as the antagonist of Ahura, he is modelled after him, and is partly, as it were, a negative projection of Ahura.

This is very ingenious speculation, but it makes the embodiment of the spirit of evil a very complicated and elaborate process. It is not possible to disprove that Angra Mainyu or Ahriman, the spirit of evil, "was produced by abstract speculation from the old Indo-European storm-fiend," but abstract speculation had probably very little to do with the creation of deities and demons. Their origin was more simple, and may be attributed to the working in the human mind of awe, fear, admiration, and other natural feelings. The impersonation of a spirit of evil, the gradual embodiment of a devil, was a natural growth. Men saw evil and woe around them in the world, and attributed it to some active energy, which they pictured to themselves as working in a bodily form. Once the idea was formed, its growth was easy and certain.

We have but little space left for an examination of the actual translation, but the reader need not feel any regret. There is little in the Vendidad worthy of notice; it is as "poor and meagre" as the translator has himself described it. The main subject of the work is purification from ceremonial uncleanness and from the effects of improper actions. Death is a great cause of pollution, and this belief has given rise to peculiar provisions for the disposal of corpses. As soon as a man dies a demon from hell is

supposed to fall upon his corpse. The body then becomes unclean, and communicates the uncleanness to every one who may touch it; hence it is necessary to dispose of the body so that the pollution may not spread. Earth, water, and fire are holy, and it would be an offence of the highest degree to make them the means of removing so foul an object. The directions given for the disposal of dead bodies are these:—

"O Maker of the material, thou Holy One! Whither shall we bring, where shall we lay the bodies of the dead?" Ahura Mazda answered, "On the highest summits, where they know there are always corpse-eating dogs and corpse-eating birds, O holy Zarathushtra. There shall the worshippers of Mazda fasten the corpse by the feet and by the hair, with brass, stones, or lead, lest the corpse-eating dogs and the corpse-eating birds shall go and carry the bones to the water and to the trees."

Or:—

The worshippers of Mazda shall erect a building out of the reach of the dog, of the fox, and of the wolf, and wherein rain-water cannot stay. Such a building shall they erect if they can afford it, with stones, mortar, and earth; if they cannot afford it, they shall lay down the dead man upon the ground, on his carpet and his pillow, clothed with the light of heaven, and beholding the sun.

The "Towers of Silence" near Bombay are examples of the kind of building thus prescribed.

A FEMALE NIHILIST.*

TO ordinary English readers, the incidents of this novel will certainly seem highly improbable. The whole conditions of social life, the modes of thought, the theories of the principal characters, are so remote from our ordinary experience that it is difficult to imagine a state of society in which they exist and act. To those, however, who have made themselves in any measure acquainted with the internal condition of Russia, political, social, and literary, there is very little in the book which will seem to exceed the bounds of reasonable liberty which are granted to writers of fiction.

Indeed, as regards some of the principal portions of his narrative, the author says: "We are only relating actual facts known to all St. Petersburg." And, with respect to the remarkable movement which has received the very appropriate name of "Nihilism," upon the progress and development of which the whole story turns, there is hardly anything here which can be regarded as overwrought or exaggerated. M. Lavigne, we understand, was for some years editor of a French newspaper in Russia, so that, in addition to the ordinary sources of information, which he seems to have studied diligently, he has had opportunities of personally observing the people of whom he writes, and more especially of appreciating the true character of the strange political struggles which are now going on in that huge, chaotic society. It does not follow, however, that his statements are to be implicitly relied upon, for it is one of the strange features of Russian life and civilization that no one can be quite sure of any conclusion which he may come to from the facts which he is enabled to collect and examine. It is, indeed, positively asserted that, partly from the action of the Government in preventing the diffusion of correct information, partly from the strange diversities which exist in different parts of the Empire, and in the different strata of society, to say nothing of the obstacle raised by foreign prejudice, it is hardly possible to arrive at any trustworthy conclusions respecting the real condition of Russia. It will not be surprising, therefore, if even the opportunities of obtaining knowledge which M. Lavigne has possessed have not always prevented him from falling into mistakes; and it is quite to be expected that many of his representations, whether true or false, should differ considerably from those of writers who have the same means of information as himself.

With respect to the strange movement around which all the incidents of the tale are grouped, and which gives the book its name, the reader may be assured that he has here not only a very readable and animated account of the theories which are in vogue within it, and of the kind of action which its promoters are wont to pursue, but that he has also an accurate representation of the so-called principles of Nihilists, as far as those have been formulated and can be understood. Probably most English readers will obtain from this book a better notion of the real designs of these revolutionaries—of the state of society out of which they have arisen, of the strange conditions which have made these secret societies possible—than by reading many of the graver essays and treatises which have been devoted to an exposition of the subject. We should add that, as a novel, the book is highly effective; the story is interesting, exciting, one might say "sensational"; and yet it is absolutely pure and harmless.

The following conversation gives a good idea of the difficulty of working Nihilist principles, and of the almost necessary differences of opinion existing among their advocates. The speakers are Sergius, who is, perhaps, the hero of the story—certainly the most remarkable figure in it—and Pavlovna, the "female Nihilist," who, if not the heroine, ought to be:—

"I beg your pardon," said Sergius, "listen to me. I am ashamed of the folly that is ascribed to us, not without reason, for the Nihilist minority is corrupted by the most pernicious errors. I am ashamed that we who propose to destroy everything can or will not put something in its place. I propose beginning from to-day to give a new direction to the Revolution."

"And how?"

"By no longer initiating members on their own mere request, and solely because they are poor, out of caste, or disinherited in some way; . . . . by knowing distinctly what it is we wish to overthrow."

"Why, to my mind, everything."

"No, not everything. It is on this point that we do not understand each other. I think that to wish the overthrow of everything is madness, pure insanity. We should find ourselves on the morrow face to face with the desert, like the Caribs or the cannibals. All that would never suit me—suit us," said Sergius, correcting himself.

"At any rate, we will see to that; go on."

"Next, must we not know what we are to build on the ruins which we shall have directly or indirectly caused?"

"We will discuss all this at leisure," said Pavlovna, after some reflection. "At present let me give you my sincere advice. You are on an evil path, you are softening; you are no longer a revolutionist. In acting as you propose to do you will lose all prestige; all confidence will be withdrawn from you."—Pp. 175, 176.

And so it actually fell out; reason and true philanthrophy were alike unheeded by the band of desperate men and women whom Sergius was for a season able to control, but who at last broke loose from the restraints of prudence which he imposed upon them. The true tendencies of the movement (we can hardly say the principles of the party) are enunciated in the following utterances of the rival leader Riboffski, who succeeded in ousting Sergius from his position of control:—

The Nihilists may and ought to aspire to office, dignity, and honour. They shall mutually help each other with all their might. They shall denounce false brethren and the suspected. They shall employ every means to assist the Revolution, which consists in the *most utter and radical destruction of the existing order of Society*. No more monarchy. No more recognized religions. No more property; the land belongs to all; the soil is like the air, everyone has a right to sustenance. *No more administration.* No more armies. Kings, soldiers, priests, *judges*, the possessors of privileges and of wealth are our enemies; at these we must direct our blows. Sentence of death is passed on every official of the empire who shall show himself directly or indirectly hostile to our plans.—P. 222.

We have marked by italics the portions of this programme which are the most outrageous and incredible. Yet they represent accurately enough the theories and designs of Nihilists. The object of the movement is simply destruction, and not reconstruction in any form or shape. Communism, in its worst forms, is innocuous and respectable compared with Nihilism. Wild and insane as the words of Riboffski may sound, they represent exactly the sentiments of the accredited leaders of the movement. It is, if anything, a system of mere Individualism—quite impracticable and impossible indeed; yet, so far as it is developed, aiming at nothing beyond this.

Such theories involve, as a necessary consequence, the absolute self-surrender and devotion of the members of the secret societies which are formed to give effect to them. Bound together by vows which are made binding, not by the faith of those who impose or of those who accept them, for Nihilism is based on Atheism, but by the certainty that their violation will be punished by death, they belong body and soul to the cause which they have espoused, and must sacrifice everything to it. Of the three or four leading characters in the story, we have seen two, and these have thoroughly entered into the spirit of what they regard as their mission. Pavlovna is one of those fanatics with "a fixed idea," who never dream of turning to the left hand or to the right, except at the bidding of the theories by which they are possessed. Sergius is a lofty idealist, imbued with the purest and most ardent philanthropy, who has become identified with the movement as the only means of lifting off from his countrymen the load of misery under which they are crushed. Another, who is intimately associated with these two, is of quite a different type. This is Vladimir, who, if he had nobility for it, should be the hero of the story. He is a mere handsome voluptuary, who has joined the movement in a spirit of adventure, reckless because he has nothing to lose, caring supremely, not for humanity or Russia, but for himself, ready to take the oaths imposed by his associates, although well knowing all the consequences, equally ready to forget them when his indolence or love of pleasure interferes, ready to break them when his interests are imperilled, having perhaps the one virtue of courage, which makes him despise dangers which he must know to be real.

The Nihilists lack the sinews of war, and it is Pavlovna who, with her man's intellect and her woman's cunning, has hit upon a device to supply them. She is a governess, and has taught the Countess Stasia, a young and beautiful Russian whose uncle dies at the beginning of the story, leaving her possessed of immense wealth. She confides to her two friends, Sergius and Vladimir, her intention of plotting for the marriage of the Countess with a Nihilist. The young girl has few friends, and trusts her former governess, who undertakes to pave the way for the union which she contemplates, in order to obtain control of the property of the Countess for the propagation of their opinions. It is Vladimir whom she selects as future husband for the Countess, on account of his personal attractions and engaging manners. She opens her plans to her two friends:—

"You know," she says, "that I still visit her, that she is well-disposed towards me, that she has often helped me; in short, that she is very kind."

"As kind as beautiful," chimed in Sergius.

"Indeed! You know her, then? Yes, good and beautiful. To-day she inherits I don't know how many million roubles."

"That is not her fault," said Sergius. "This inheritance, resulting from the state of society, can in no way be made a reproach against her!"

"Who wants to reproach her? What I am thinking is how we can exploit this inheritance for ourselves; how to make it come into our hands and benefit the cause. And, if you attend to me, if you have the heart and thews of men, if you have blood in your veins, this enterprise, difficult as you may think it, will be accomplished in a moment."

* *A Female Nihilist.* By Ernest Lavigne. Translated from the French by G. Sutherland Edwards. London: Allen & Co. 1880.

"Pavlovna, we are all attention; we never knew you more interesting!" said Vladimir.

And in his heart the young man was thinking of those fabulous sums which represent so much pleasure, which a whim of fortune had thrown into the hands of a woman who could not manage, utilize, or understand them. Ah! had fate only made him rich, instead of casting him almost naked on the parched soil of frozen Russia, he would have known how to enjoy himself and make an effect.

Sergius had other thoughts; in his hands such a fortune might have served to console the exile, to raise the victim of tyranny and despotism, to aid the rapid spread of Socialism, to foment revolution, to overturn the pyramid and set it on its base; for nowadays, in his eyes, it was on its apex; and the injustice, the contradiction, the fallacies of his time and country were ever pressing on his throat and well nigh strangled him.

Gradually Pavlovna unfolds her idea of gaining possession of the wealth of the countess; and she induces her two friends to swear that they will do her bidding, and assist her in carrying out her plans. She points out to them that it is only by the extinction of individuality that they can reach their ends. She is herself making great sacrifices, for she loves the man whom she has destined to be the husband of Stasia. To each of the friends she gives his own work. Sergius, "what the world calls a true and noble man," has not, she thinks, "enough exterior gifts to carry Stasia's heart." Therefore, it is his part to convert her to Nihilism, to be the steward of her fortune. Vladimir is handsome. "The sight of thee," she says, in her excitement using the second person singular, "makes women's hearts bound. Thou art the man who shall marry Stasia."

Here is the plot which Pavlovna now sets herself to carry out. One great auxiliary she found in the loneliness of the Countess. Open to all human sympathies, she had few objects for her affections to rest upon. Her uncle's friends had not been her friends; the few that she had were not congenial; besides her time of mourning secluded her from society.

"I am alone," thought Stasia, "and in spite of my great possessions, in spite of the rank that will be mine if I please to take it, at the Court, in spite of the high position that my fortune gives me, I am isolated. There is really no one to love, to understand, or to protect me. I cannot bear the world and its festivities; I do not enjoy them, I cannot shine among them. On this side then, without a greater effort than I feel capable of making, there is nothing to hope. Shall I receive visitors at home? Whom am I to receive? My friends! they are very unstable and indifferent; possibly good-natured, certainly careless. The Count had no friends that I liked."

From one thought and reflection to another the Countess arrived at this conclusion, which, though she did not express or formulate to herself, was none the less logical. "I need to love."—(P. 113.)

It was to this state of mind that Pavlovna addressed herself, and she found her task more easy than she had anticipated. Happily for the success of her schemes, there was no serious rival in the way. Suitors of any delicacy of feeling would not obtrude themselves on the Countess in her time of mourning; those who did present themselves as aspiring to her hand only formed a foil to Vladimir. Sergius, while trembling for the future happiness of the charming Countess if she became the wife of his associate, was bound by his oath, and by his devotion to the Revolution, to assist in carrying out the scheme. It succeeded only too completely. The fanaticism of Pavlovna, which made her so keen to discern the opportunity for the advancement of the movement, blinded her to the true character of the two persons whose destinies she had united. Fascinated herself by the physical attractions of Vladimir, as intellectual women often are fascinated by men who have hardly anything in common with themselves, she could not see how little this essentially unrefined, shallow, selfish, pleasure-loving nature could satisfy the pure, deep, tender nature of her friend—how little either a woman like Stasia could fill and hold the heart of a man like Vladimir. As far as the Countess was concerned, she was at least faithful to her husband. As for Vladimir, he lived and acted according to his kind.

If the scheme had little success in bringing happiness to the parties most deeply interested, it brought little more advantage to the Nihilists, and ultimately it became the means of inflicting upon them the most serious and permanent injuries. Every needy Nihilist thought he had a claim upon the purse which Vladimir could now command. It was his simple right. Vladimir had married for no other reason than this. Besides he belonged, with all he had, to the great movement and to every member of the Society which was formed to promote it. Vladimir became dissatisfied, sullen, obstinate. These Nihilists were a simple nuisance, the organization a mistake. At the same time, Sergius and his old confederates were drifting more and more apart, Pavlovna holding to the one side or the other as her impulses inclined her. Finally Vladimir, in spite of the remonstrances of his two friends, who reminded him of his oath, and pointed out his danger, the inevitable consequence of the violation of his oath, shook off the Society and bid them defiance.

It is better, perhaps, that we should leave the reader to seek for the continuation of the story in the book itself. The whole story is easy and entertaining reading; the situations, if startling, are not unnatural. Human nature in Russia, in Nihilism, even in Nihilist novels, is very much the same as it is elsewhere. But, apart from the interest of the story, there is not a little to be learnt from this volume respecting the difficulties of the Russian Government as well as the difficulties of reformers, no less the most reasonable and moderate than the most irrational and fanatical. If ever the world was "out of joint," it must seem so to Russian patriots. As to the best way of remedying the dislocation, that is a question which it requires some boldness to answer. Nihilist conspiracies and murders, Nihilist seizures and trials, the confounding of the innocent and the guilty, the condemnation of ideas and supposed tendencies equally with overt acts of rebellion, these are the things which we can read in this volume, as we can read, or at least hear, of their happening in Russia every day.

We fancy that the writer is not free from that inaccuracy in describing Russian society which his countrymen so often betray, to our own great amusement, when they describe English society. The account, for instance, which he gives of a Nihilist marriage is very different from the description of the same thing which we find in documents of greater authority. But these are small matters. The general representations of Russian society are only too near the truth; and the theories, designs, and methods of the Nihilists are set forth with perfect accuracy. The atmosphere of the book is thoroughly Russian; the colouring, if we may thus distinguish, is French; and the translation reads, as far as a translation from a French book with a Russian subject can read, like an original English work.

LIFE OF SIR JAMES OUTRAM.*

JAMES OUTRAM never worked out the transformation of an Indian province from misrule and anarchy to order, nor is his name familiar to some millions of Hindu cultivators, like those of Munro and Thomason as the founder of a "Revenue Settlement." He never, except on one occasion, commanded a large army in the field, or retrieved a great disaster, or ended successfully a campaign on which the fate of the Indian Empire hung. But it would be difficult, out of the range of Anglo-Indian worthies, to select a character which conveys more instruction to the rising generation of officials, and seems to connect the nineteenth century with what we are accustomed loosely to call the age of chivalry. The family of Outram was old and respectable, and at one time wealthy, while it seemed as if young Outram would inherit a competence. The death of his father in middle life, his money sunk in works not then remunerative, left the care of five children to his widow, who seems to have been a lady of much spirit, energy, and acuteness. Her son was evidently endowed with a large portion of his mother's qualities; was known as a bold, fearless, and active boy; and early exhibited signs of ingenuity and talent. A doubt as to his proper profession was soon settled by the offer of a direct Indian cadetship, which he preferred to a nomination to Addiscombe; and at the age of seventeen he found himself appointed to the 4th Bombay Native Infantry, in the sixth—not the ninth year as the biographer has it, of the administration of the Marquess of Hastings, who had just deposed the Peshwa, put down the Pindarries, and broken up the Mahratta confederacy. During an adventurous service of more than forty years, Outram took a part in many historical events occurring between the rule of Lord Hastings and that of Lord Canning, from which we need only except the Gwalior campaign, the Sikh wars, and the operations in Burmah in 1824 and again in 1852. But his experiences were strikingly diversified; he commanded the approval of three Viceroys besides the Governors of his own Presidency; he was brought repeatedly into contact with wild tribes, astute native potentates, and mutineers flushed with partial successes; and though belonging to the Western Presidency of India, it is no exaggeration to say that his memory is as much cherished and honoured in Agra and Bengal, as if he had begun his service in the cantonment of Dum-Dum and had ended it before the walls of Delhi.

Other Anglo-Indians have risen to eminence by resolutely adhering to one or perhaps two departments of the public service. The name of Outram is repeatedly turning up for thirty years where we least expect it, and at any interval between the first Burmese war and the Sepoy rebellion. While other officers were vainly struggling to pass the languages and be selected for civil employ, Lieutenant Outram who never was much of a linguist and knew no Persian, had succeeded in taming and civilizing a whole tribe of Bheels. These aboriginal savages to the number of more than fifty thousand when driven out of Meywar by the Rajpoots, had settled in the wild and jungly district of Khandeish. Something had been effected by our predecessors, the Mahometans, to reclaim these savages in the plains. In the mountains and passes the Bheels had proved unapproachable and intractable. Their occupations were plunder, robbery, and murder, varied by hunting. Sternness and severity had been tried in vain. It was reserved for Outram to win the confidence and attachment of this strange race by a mixture of daring and kindness to which the author of the biography has not done more than justice. At one time Outram surprised and dispersed a band bent on a desperate outrage. At another he trusted himself almost alone in the hands of their leading men. Now he gained his object by copious libations of brandy; and now by killing half a dozen tigers on foot, and getting once or twice clawed in the process. In the end, like Cleveland with the Bhaugulpore Paharries, he formed a corps of Bheels, put down lawlessness, and actually persuaded a regiment of the regular army to receive these *Mlechhas*, or outcasts, as their own flesh and blood. No more conspicuous triumph has ever signalized the Anglo-Indian adminis-

* *James Outram.* A Biography. By Major-General Sir F. J. Goldsmid, C.B., K.C.S.I. With Illustrations and Maps. 2 vols. London: Smith, Elder, & Co. 1880.

trator dealing with Coles, Gonds, and other non-Aryan tribes; and we are not surprised to hear that recent officials have found these Bheels worshipping a little image in which their imagination had detected a resemblance to the features of "Outram Sahib.' From big game, wooded defiles, and reclaimed savages, there was a sharp transition to political employ. In 1835 Outram was deputed to the little Principality of Mahikanta, of which the affairs were complicated by its connexion with the Gaikwar of Baroda and the Raja of Edur. Here he compiled, a report which, like many other Indian productions, was not a model of brevity but produced lasting results. Shortly after this he married his cousin, Miss Anderson, and, in 1838, he was appointed A.D.C. on the staff of Sir John Keane, then in command of the troops ordered to Afghanistan. It is only one of the remarkable episodes in his life that, in spite of a fractured pelvis, he entered Candahar, was present at the capture of Ghazni, crossed the Shutargardan Pass, went as far as Bamian in vain pursuit of Dost Mohammed, saw Kabul, had a successful encounter with the Ghilzais, returned to Quetta, and was present at the storming of the capital of the Khan of Kelat. The remarks of Outram on the proper policy to be pursued towards the Afghans are pregnant with meaning and were never more worthy of close attention than at this present eventful crisis.

In 1842 Outram was appointed Political Agent in Upper Scinde; and he thus gained experience of the intense discomfort of the Scinde climate, its fiery heat and its plague of boils, as well as of the equally hot temper of the two Napiers. His famous controversy with these pugnacious brothers might be summed up in a few sentences. Outram maintained that the Amirs of Scinde had really no warlike intentions; that they only required tact and management; that Mir Ali Morad had propagated false reports to the discredit of the other chiefs; and that it would be quite possible to maintain the patriarchal rule of four Amirs at Hyderabad and a similar number at Khairpore. Sir Charles Napier, on the other hand, was determined to compel the Amirs to sign a revised treaty, would hear of no delay, and would brook no opposition; and, as is now generally conceded, drove the unlucky Amirs into acts of defiance, which began with the attack on the Residency defended gallantly by Outram, and ended with the battle of Meanee and the annexation of the Province. It is one of the ironics of Fortune that the well-known title of the "Bayard of India" should have been conferred at a public dinner on Outram by the very soldier whose brother afterwards employed all the resources of a clever pen to demolish his character. With pleasure we turn to Outram's remark in after years before the walls of Lucknow when he saw the well-known handwriting of the deceased conqueror of Scinde—"Ah! poor Charley, he could appreciate a good soldier." After an active service of nearly a quarter of a century Outram took a short leave to England. On his return he was appointed to the charge of Nimar—a post much below his deserts—and then on the outbreak in the Southern Mahratta country in 1845 he was sent to Sattara as Resident. From this place he was transferred by Sir George Clerk to a similar but more important situation at Baroda. And here began his celebrated campaign against *Khutput*, which convulsed the whole community, somewhat damaged the Government of Lord Falkland, gave birth to a huge Blue-book, and led to the removal of Outram from his post. We have always been of the opinion that Outram damaged a first-rate cause by intemperate and injudicious handling. Of the existence of *Khutput*—that is, bribery, of the belief of the natives in its efficacy, and of the stain it cast on the honour of our administration, there can be no more doubt than there is of Outram's purity of motive and honest determination to expose venality. So, at least, thought the Court of Directors, the public, and Lord Dalhousie. A man of Outram's splendid qualities and noble character is never very long under a cloud. He was well received at home; he narrowly missed employment under Lord Stratford de Redcliffe at Constantinople; and when he returned to India at the close of 1853 he was sent back by Lord Dalhousie to the very post from which he had been removed by the Bombay Government. Sir F. Goldsmid does not give sufficient prominence to the fact that Lord Dalhousie, with his characteristic decision and sagacity, effectually exorcised the demon of *Khutput* by bringing Baroda and its affairs under the immediate cognizance of the Foreign Office at Calcutta. And, thenceforth, Mahratta rascality never got as far as Bengal. Political justice being satisfied by Outram's triumphant return to the capital of the Gaikwar, he was soon afterwards sent to Aden as Political Resident and Commandant. Work and excitement had, however, told on his constitution, and, after his acceptance of the Residency of Lucknow, he had just energy enough left to furnish an exhaustive report on the condition of the kingdom, and to smooth over the difficulties of annexation as far as this could be done by a man who could unite implicit obedience to his own Government with genuine consideration for a dethroned king. Driven home to England in the height of the hot season of 1856, he had begun to recruit his health when he was summoned to take command of the expedition to Persia. The results of this brief campaign were our victories at Khushāb and Mohamra, the renouncement of any claim to Herat on the part of Persia, and the timely return of our forces, including the 78th Highlanders, for the suppression of the Indian Mutiny. It raises our estimation of Outram's foresight that when all was peaceful in India in May 1856, he had expressly brought to Lord Canning's notice the defenceless state of the fort at Allahabad, and had vainly urged its occupation by the wing of an English regiment. The prominent part played by Outram in the advance to Lucknow, his self-effacement and relinquishment of the chief command to Havelock, his splendid defence of the Alum Bagh after the first relief of the garrison and before the final capture, are all subjects which, if widely known, deserve to be studied in General Goldsmid's narrative. The substantial reward of such services was a seat in the Supreme Council as military member, where, with his unfailing energy, Outram threw himself into the work of reading and writing long minutes on the amalgamation of the Royal and Indian armies, the amnesty to the rebels, the military defence of Bengal, the comfort of the soldier in the heat and confinement of barracks, rewards and honours to native chiefs, and railways and police. But the end was near at hand. In July 1860 this soldier-statesman, who had tamed wild tribes, had faced hordes of mutineers, had commanded an army in the field with success, had waged war with low official rascality, and had courageously reproved inertness in high places, left India never to return to it. In less than three years, borne down by toil and climate, he was laid in Westminster Abbey, where, as Macaulay has told us, lie buried the enmities of some twenty generations.

Readers of these volumes and the Anglo-Indians who witnessed Outram's career in India, will hardly fail to note two marked peculiarities of his character. He was utterly fearless of responsibility, and he was utterly indifferent to the claims of self when others were concerned. To ask for special instructions when real work had to be done, to wait on the chapter of events in order that some lucky chance might resolve perplexities, was no part of his creed. In 1824 when only a subaltern, he was sent in command of two hundred men to put down an *émeute* in Khandeish. The insurgents had got into a fort, which Outram saw might easily be carried by a *coup-de-main*. To take this fort was no part of the lieutenant's orders; but he made up his mind, and dashed in with his party after nightfall, dispersed the garrison, and put down the insurrection. Not many years after this, on an appeal from the Gaikwar, he consented to combine with the native forces of that ruler in order to crush a rebel chief. This was done without the smallest reference to the Government, and after he had just been censured for issuing a proclamation of outlawry against a certain Suraj Mull. During the campaign in Afghanistan of 1838-40, Outram actually took on himself to suspend a Government order remanding to regimental duty a trusted subordinate, because the said order seemed unfair. In dealing with *Khutput*, as already noticed, he employed strong epithets when a more temperate style of argument might have served his purpose equally well. But in those times action was not influenced by special correspondents or suddenly checked by obtrusive telegrams, and during the greater part of his career Outram's fine and generous nature ensured him friends at headquarters, who either did him justice or contrived to mitigate the severity of the departmental pen. Yet, if Outram was high-spirited, needlessly sensitive, impatient of control, and fearless in controversy, he could show the greatest tenderness towards equals and subordinates. Possibly, in the twenty-first century of our era, when there will be no certainty about any one thing, writers will be ready to prove on the most correct principles of critical interpretation, that Outram never waived his right to command or tendered his services to Havelock as a volunteer. But with contemporaries this, the most famous, is only one of half-a-dozen similar waivers. He was willing to give up his right to command troops against some insurgents in the Mahi-Kanta, because he was junior to some one who expected the post. He never touched a farthing of the Scinde prize-money amounting to some 3,000*l.*, except to hand it over to charitable institutions such as Dr. Duff's schools; and he refused to draw his full pay as Commissioner in Scinde, contenting himself with his regimental pay and allowances. When his friend Colonel Ovans was captured by a tribe called the Gadhkaris, Outram actually offered to take his place; and he was anxious to allow an old friend and contemporary, General Stalker, to have the entire credit of reducing the town of Bushire—which, by the way, Sir F. Goldsmid, under the new orthography, will persist in calling Bushahr. All this was not done to catch public applause. It was the genuine, unaffected outpouring of a man who was ready to put his own name second and even third on the list of candidates for employment.

If we were asked to select a performance which, viewed as a benefit to the State or as an instance of individual capacity, is most striking, we should point to the defence of the Alum Bagh. Let us just recall the circumstances. Havelock and Outram, who had relieved the heroic garrison of Lucknow, found themselves undergoing a second siege, though with a little more space to move about, and under less unfavourable circumstances. When Sir Colin Campbell came to the rescue in November 1857, the propriety of the retention or abandonment of the city and the province was very much discussed. We remember hearing at the time from a gentleman in very high position, what is confirmed in this biography, that Outram stated his ability to keep the command of the capital by the aid of a moveable division, and also that he urged the capture of the Kaisar Bagh. Sir Colin Campbell wished to withdraw all forces with the exception of those sufficient to "hold the city in check." Of the Commander-in-chief's capacity for massing large bodies of troops and directing various strategic operations towards one distinct end, there can be no sort of doubt. But we have a clear recollection that the withdrawal of the bulk of our forces after the second relief of Lucknow was considered impolitic; and we have no doubt that it added to the trials of Lord Canning. It, however, gave Outram an opportunity of which he fully availed himself. The Alum Bagh is an enclosure just outside the city, on the high

road to Cawnpore. Outram fortified and held it from the end of November to the first week in March with less than 4,000 men of all arms, against organised and mutinous troops of our own drilling amounting to 120,000 with more than 130 guns. This horde was swollen by all the scum of the city. The only point in Outram's favour was the splendid cold season of Upper India. For more than three months the attention of the Anglo-Indian community was as much fixed on the Alum Bagh as on any other Province in which the work of retribution was going on. Again and again did the troops of the Maulavi and the Queen mother, reinforced by the Gwalior contingent, dash themselves in vain against the frail British lines. Outram, with his inevitable cigar in his mouth, a kindly word for the sick, and an eye for the comfort and the recreations of his men, was always on the alert. His communications with Cawnpore were rarely if ever intercepted, his intelligence was never at fault, his losses were trifling, and the influence exercised by him in his isolation over the whole campaign was simply incalculable.

We have hardly room left for further details. Sir F. Goldsmid's pages are not wanting in anecdotes which relieve the dryness of tiresome official disputes. In early days, with the long hunting spears peculiar to Bombay and Madras, Outram was foremost in the pursuit of the wild boar; and we rather wonder that he did not gain for himself the sobriquet of Lance Outram, from one of the minor characters in one of Sir Walter's novels. We can fully understand the admiration of the Bheels for a soldier who had been at the death of 191 tigers, besides panthers, buffaloes, and bears, and from whom it was an honour to take "a first spear" over a country far more difficult than the level plains and *churs* of Bengal. We may, however, be permitted to doubt whether there is not some error in p. iii. vol. 1, where Outram is described as galloping up "with an enormous tiger strapped to his saddle-bow." Those animals are when slain generally packed on elephants or brought to camp on bamboo poles by coolies. All horses have a notable antipathy to the odour of a tiger dead or alive, and the weight alone would be too much for an ordinary horse if the animal could be coaxed to carry it. That Outram never condescended to shoot small game or to use anything except ball, is a characteristic which will find few imitators. To the "all-round" Anglo-Indian sportsman a mixed bag picked up in the marsh, tank, and jungle is a peculiar gratification, and Khandeish used to give splendid facilities for all kinds of sport.

It only remains to say a few words about the compilation of this biography. Sir F. Goldsmid's experience as a public servant in India, Belochistan, and Persia is a guarantee for his accuracy in phraseology, dates, names, and facts. He has taken much pains to analyse public documents, to explore private memoranda, and to obtain information from Outram's family and friends. We cannot go with him in his new way of spelling old names; and we could wish that the dates at the top of each page had been those of successive and distinct years, instead of cycles and periods. It is very generous of the editor to wish that Sir John Kaye had lived to give us a full-length portrait, instead of his mere sketch of Outram; but Sir F. Goldsmid has discharged his task most creditably, has never degraded his subject by excessive adulation, and has given us a biography which should be read side by side with that of Henry Lawrence, with whom, as regards sensitiveness, self-denial, generous treatment of inferiors, kindly feelings towards natives, and nobility of thought and purpose, James Outram had very much in common.

FAUNA OF BELFAST LOUGH.*

It is not possible to multiply experience indefinitely without adding to the sum of human weariness, and we confess that we sighed rather pensively in taking up so large a volume as this on the fauna of one bay in the North of Ireland. But we have not found Mr. Patterson at all an importunate guide, and he is himself as conscious as we were of the limited material at his command. He has accordingly adopted a plan which we should be sorry to see generally imitated, but which has led in his case to the production of a very readable book; he has eked out his interesting, but not very extensive original notes, with all sorts of parallel information derived from the books of other naturalists. As most of these authors are local ornithologists, or observers whose writings are a little out of date, much of this appended matter will have the freshness of novelty to ninety-nine out of a hundred readers, and Mr. Patterson gives his references most conscientiously in every case. Thompson is his great authority in the matter of Irish birds, and the accuracy and care of that distinguished zoologist receive from him the eulogy they deserve. In one case the pupil cannot resist the temptation of telling a good story against his master. Thompson prided himself, and with justice, on the scepticism with which he received and examined every statement regarding the habits of birds which did not permit of his personal examination. However, when his book was published, some portions of it were read aloud to an old sportsman, who stopped the reader at a certain passage and eagerly asked, "Is *that* in the book? Why, I told Thompson that lie myself!"

We do not propose to follow Mr. Patterson in his excursions into other people's territory, but strictly to confine ourselves to his own. Belfast Lough is a long open gulf, some fourteen miles long and eight miles broad, open to the north-east; its southern shore is rocky, with occasional sweeps of sand; the northern shore, on the contrary, shelves into low flats, laid bare for acres upon acres when the tide goes down. At the head of the Lough stands Belfast, doing its best with all its factories and railways and steamers to poison and disturb the shy creatures that still venture to haunt the pools and coves. So regular and conventional, however, become the lines of communication, even when they pass through a wide and deep bay, that the fauna of the Lough is but little altered by the constant passage of steamboats through the centre of its waters. These look their best, Mr. Patterson tells us, in the months of August and September, when the shoals or "balls" of fry come stealing into the Lough, followed by all the winged pirates that live upon these silver argosies. The water then is full of fish and the air full of birds; the razor-bills and guillemots float upon the surface, the gulls and terns wheel overhead, and the ravenous skua, too lazy to fish for his own dinner, watches to see who is the most successful among the gulls. Him the skua singles out for his attack; he waits till his victim is gorged, then pursues him till he casts up the undigested fish, or, if the gull neglects that act of fealty, the skua kills him with his hooked and powerful bill. Over the whole scene floats the gannet, disdaining the fry, but falling into the water every now and then like a plummet, in search of some larger game, a loud noise and a jet of foam testifying to the vehemence of his descent. In direct contrast to this eagle of the web-footed race, the bright little shearwaters, or "mackerel-cocks," as the Ulster fishermen call them, quietly tuck away their long, scythe-like wings, and gobble at the fry like pigeons pecking corn in a farmyard. Happy is it for all these busy birds if no bottle-nosed whale happens to stray into the Lough, for he will swallow the whole ball of fry in a couple of mouthfuls. Meanwhile, on the broad flats of the northern shore no less busy a scene presents itself. Until large tracts of land were reclaimed, chiefly to form railway embankments, the wide reaches between Carrickfergus and Belfast were usually alive with herons at low water. The herons miss their old feeding-places, and are less common now; but the banks are still covered with curlews, oyster-catchers, and redshanks. Mr. Patterson describes the curious way in which the tide forces the flocks of birds up to the shore, till at last their final eminences are submerged, and they rise, often in a dense cloud, away along the shore of Downshire, out to sea by Groomsport or the Copeland Islands. Here they wait for the turn of the tide, and about two hours after high water they leisurely come back, so as to be ready to settle on the flats again as soon as the tide has gone down. The lower banks, which are never left quite exposed, were, until quite lately, covered with the bright green ribands of the *Zostera marina*, or grass wrack, which is the favourite food of many marine birds, and which attract vast flocks, or "gaggles," of brent geese and widgeon. Mr. Patterson, however, observes a great change coming over the Lough in this respect; whether owing to the deepening of the sailing channel, or to some other cause not clearly understood, these flats, which used to consist of a muddy ooze, are changing into banks of hard, clean sand, on which the *Zostera* will not grow. The result of course is that the wild geese and ducks go elsewhere to find the food they love.

Mr. Patterson does not record the capture of many very rare species, but his notes are valuable for the experience and patient observation of habits that they show. He has been used to Belfast Lough all his life, and, although evidently a keen sportsman, the mere slaughter of birds has not been his principal pleasure. His accounts of what he has noticed prove him to have spent many hours in that masterly inactivity, that alert indolence, which is the great secret by which a naturalist reaches the mystery of nature. A bustling, noisy man will find no presence but his own upon the shore or in the woods; the man who knows how to lie silent and motionless, but open-eyed, will soon allay the suspicions of bird and animal, and will find the earth and air around him animated by a great company of delightful creatures. To this power of silence must be added the trained eye that recognizes what it sees, distinguishes forms in motion, and knows a species under all the disguises of sex and age. From several excellent passages in which Mr. Patterson proves himself a master of this art of observation, we select one which describes with great precision the gregarious habit of the sandlark or dunlin:—

> To witness a large flight—or, as it is more correct to call it, a "fling"—of Dunlins on the wing is a sight as curious as it is interesting and beautiful. It is not when they are flying with an apparently settled purpose from one place to another, but when they are flying about hither and thither over the banks, in a "fling" of from a few hundreds up to thousands in the flock, that their wonderful lightness and activity on the wing are seen to such advantage as to strike even the most casual beholder with admiration. At one moment the spectator sees at a distance a dense dark body moving rapidly along, which a practised eye at once sees is a large flock of sandlarks. Watch them, and, to your amazement, if they are some distance off, the rapidly-moving dark cloud will suddenly almost, or sometimes entirely, disappear. This is caused by the whole flock simultaneously turning their sides, and the edges only of their wings to the spectator. Slowly then, and looking at first like a shadow, the birds reappear, the flock comes into full view as at first, and one is wondering what the next change may be, when, instantaneously, every bird in the whole flight, turning its white under-surface towards the spectator, almost dazzles him with a momentary flash of bright silvery whiteness; the appearance of the flock under this aspect having been most aptly compared to a shower of new shillings. These graceful and attractive evolutions are often repeated, each change being a surprise; for owing to the constantly varying shape of the flock, which one moment may be in a long-drawn-out line, and perhaps the next in a round ball, no two of the movements are exactly alike. The flock, if large, often breaks up, but only shortly to reunite again.

* *The Birds, Fishes, and Cetacea Commonly Frequenting Belfast Lough.* By Robert Lloyd Patterson. London: David Bogue.

Not less exact and picturesque is the description of the manœuvres by which that powerful bird, the great northern diver, eludes pursuit, and the account of one particular chase can scarcely be read without infecting the reader with something of the author's excitement.

In the winter Belfast Lough is much frequented by scaups and scoters, and Mr. Patterson's notes on these species are specially abundant. He describes the extraordinary effect caused by the simultaneous rise of a paddling of between two and three thousand scaups. The noise is like the roar of a large waterfall, so many hundreds of powerful wings threshing the water at once producing this surprising sound. When a boat approaches a large flock, only those birds facing the boat rise at first, their movement, and not the progress of the boat being the cause of the terror of the next rank; the flock thus rises slowly and regularly, the noise being extended over several minutes. The scoters are becoming more numerous every year on the coast of Ulster, and they float in and out of the loughs as the flowing or ebbing tide carries them, sometimes covering acres of water with their dense flocks. Their flesh is coarse and fishy, and they would scarcely be killed at all, were it not that the Roman Catholic Church recommends them as a diet fit for Lent and all fast days. Mr. Patterson records the fact that a pair of the rare and beautiful Velvet Scoter, *Oidemia fusca*, was seen by him on the 6th of February, 1875, about a mile from shore, near Carrickfergus.

We are promised notes on the Cetacea by the title-page, but Mr. Patterson has not much to tell us about them. Except the porpoise and the bottle-nosed whale, very few cetaceans commonly find their way inside the Copeland Islands. The dolphin is absolutely unknown, and but single examples of the pilot-whale and of the grampus have come under Mr. Patterson's experience. The cetaceans seem to ascend St. George's Channel much less than it would be natural to expect from the frequency of most species on the coasts of Cornwall and Devonshire. The bottle-nosed whale, by which Mr. Patterson means *Hyperoodon rostratus*, is called the herring hog by the Ulster sailors.

Though the author does not possess a polished style, and is occasionally given to rambling, he has a picturesque vigour in expressing what has greatly interested him, which commands the attention of the reader. There is a description of a squall in the book (pp. 237–241), which is one of the best things of the kind we have met with for a long time, and which would make the fortune of a nautical novelist. The volume is provided with an excellent map and a good index.

CALDERON.*

CALDERON almost belongs to that class of writers whose reputation has survived their works. The Archbishop of Dublin, in his preface to this second edition of an essay published four-and-twenty years ago, confesses to a fear that he is working on an exhausted theme, and recognizes that "the interest in the poet, though not absolutely non-existent, is exceedingly faint." For this loss of interest in a dramatist round whose works a literature of praise, blame, and comment has collected, he makes no attempt to account. Perhaps this is due to an unconscious feeling, naturally painful to an avowed admirer of the poet to confess, that the interest never was very real, and that Calderon owed the great reputation he once had throughout Europe rather to the ardent championship of a small body of popular writers than to his own merits. His fame was the work of the Schlegels. It became an accepted dogma with their critical school that he was a great genius, and the world believed it on their authority. That authority has been weakened, and the world has long begun to suspect that their praise of the Spaniard was due, at least to a great extent, to the same motive which prompted Pope's civility to some one, a wish, namely, to be offensive to a third party. They used the merits of the Spanish theatre as a good literary stick wherewith to beat the French. As the Schlegels and their followers are no longer so implicitly believed in, their idol Calderon, though perhaps not less read, is less talked about. This may seem a very cavalier, or perhaps the right word is Philistine, way of treating such a renown. The few genuine admirers of the poet, the many who admire him on the authority of others, and who, if they have read his works, have done so with a predisposition to find there the merits they have been told are to be found, can always claim to be supported by the great names of Göthe and Shelley. But Göthe made his reservations, and they are very considerable; while as regards Shelley, who gave a very practical proof of his admiration by translating a part of the *Magico Prodigioso*, it may be doubted whether he did not apply to Calderon's "starry autos" that process of mystic interpretation by which anything may be made out of anything.

After all, the great fact about Calderon is that he should have found such admirers. A poet whose works are read and praised, and some of whose plays keep the boards two centuries after his death, has won an enduring place in literature. He deserves that effort should be made to show what that place is. Archbishop Trench, while obviously dissenting from the verdict that would rank him with Homer and Dante and Shakspeare, is yet inclined to place him very high. He would certainly agree with a writer who lately, in a protest against the discursive and shallow reading of our time, drew up a limited list of men to be read, and included Calderon among them. He has no hesitation in calling him a genius and a great artist. As we are still awaiting a satisfactory definition of the word genius, the title may pass; but a writer's claim to be a great artist is capable of closer analysis.

The first thing to be considered in an estimate of Calderon is that he is one of a large body of writers for the stage who were almost contemporary and who all worked on the same lines. If he is to be read it is not easy to see why we should neglect the works of Moreto, Alarcon, or Tirso de Molina, who were his equals in many respects; still more why Lope de Vega, who moulded the whole dramatic literature of Spain, should be left in obscurity. And it would be easy to add many other names to this list. We have a right to call upon those who claim a special position for Calderon to show that he brought to the dramatic literature of his country something beyond a more glowing style and a greater dexterity in using for stage purposes a certain limited number of conventional characters, situations, and motives which were common to all its writers. To have done this is much, but it scarcely entitles a poet to be called either great genius or great artist. And, except in one branch of his work which will be considered further on, we do not think that an impartial judge, possessing the necessary knowledge of dramatic literature in general and of the Spanish drama in particular, would be inclined to grant him more than this. What has been claimed for him can be best learnt from the well-known lectures of A. W. Schlegel. But the claim is confuted by its own vagueness. Any reader who is imposed upon by its misty eloquence cannot do better than take the advice of Mr. G. H. Lewes, and try and see what clear idea of Calderon's genius or art he has gained. The total want of anything like such a coherent conception will probably cause him to doubt the worth of such critical guidance. Archbishop Trench is, it is almost needless to say, very far from indulging in such ambitious rhetoric, or falling into similar confusion of thought. He even protests against those who would conclude Calderon to be a "poetical Melchisedec," and is careful to point out his close relationship to contemporary dramatists, and to confess his inferiority to some of them in certain points. He sees that in comedy the poet's "vein of comic dialogue is sometimes forced, and sometimes flows scantily enough." In somewhat milder terms he repeats Göthe's reproach that the Spaniard's characters resemble leaden bullets cast in the same mould. Yet, when these deductions are made, he believes that enough remains to entitle Calderon to rank among great original writers. He claims for him a sense of dramatic situation as apart from mere skill in stage effect, and repeats the praise often given to his "infinite dramatic tact and skill." The proof of the former quality produced by Archbishop Trench is singularly unfortunate, if cited as an instance of Calderon's originality. It is the second act of *Los Cabellos de Absolon* which contains the really powerful scene of Amnon's punishment for his great crime. The praise given to this scene by the writer is well deserved, but should in justice be given to Tirso de Molina, the second act of *Los Cabellos de Absolon* being, in fact, the third of Tirso's play, *La Venganza de Tamar*, which Calderon incorporated into his own, with the suppression of a few phrases. If this were the proper place in which to deal with the Spanish comedy (using the word in the Spanish sense of play of any sort) at large, the Archbishop's mistake might be made the occasion for a demonstration of the conventionality of the whole literature. The characters, the situations, and the motives are fixed by tradition. The dramatist is, to use a common illustration, in the position of the chess-player, who moves his pieces at will, but only on certain fixed rules, and is unable to alter their characters.

To the question whether Calderon excelled other players in the game—that is, how far he is entitled to the praise of "infinite dramatic tact and skill," Archbishop Trench gives an affirmative answer. He maintains that "all is laid out to the best advantage, all is calculated and weighed beforehand" in the Spaniard's plays. But the verdict is unsupported by evidence. It is not enough to prove such a large assertion as this, to cite the very effective situations presented in different plays. As Mr. Lewes says in his study of Calderon, the imagining of an effective situation is comparatively easy. The difficulty to be overcome by the dramatist is to make it the natural, the inevitable result of the previous action. To show that a writer for the stage has done this, we must have a careful analysis of several of his pieces, and the analysis must be made from a strictly dramatic point of view. No admiration for mere beauties of style, or approval of the writer's excellent moral, must induce the critic to overlook superfluous scenes or improbabilities in the representing of cause and effect. Here we believe that Archbishop Trench conspicuously fails to prove his point. He gives an analysis of only one play, the famous *Life's a Dream*, and we feel throughout that in his admiration for Calderon's excellent Christian moral he almost overlooks the fact that a play is a play. He hastens over a very essential incident in the first act without mention, and dismisses the underplot, which occupies a great space in the original, in a sentence. We have no space here to go through the play scene by scene; that has already been excellently done by Mr. Lewes in a little work which he wrote for Knight's monthly series, and those who wish to see how a play ought to be criticized may be safely referred to it. *Life's a Dream* unquestionably gives proof of a lively and fantastic imagination in the writer, and it has many effective scenes, but

* *An Essay on the Life and Genius of Calderon, with Translations from his "Life's a Dream" and "Great Theatre of the World."* By the Archbishop of Dublin. Second Edition, revised and improved. London: Macmillan & Co. 1880.

the action is helped on by clumsy expedients, and the dialogue is defaced by extravagant rants. Calderon's own countrymen, who have been more temperate in praising him than many of his foreign admirers, acknowledge that similar faults are to be found throughout his works. A very slight acquaintance with his plays will convince any reader that he had no scruple about using the same stage trick over and over again. He confesses as much with humorous frankness in his own *No hay burlas con el amor*, where he makes one of his characters say that the position in which he finds himself reminds him of the plays of Don Pedro Calderon in which there is always an "amante escondido, o rebozada muger," a hidden lover and a veiled lady. "The divine master" is almost as fond of blowing out candles as of hiding his hero in a closet. The necessity of protesting against the excessive claims made for Calderon has compelled us to spend perhaps too much time in pointing out his faults. It is a pleasanter task to dwell on his merits. No writer is a greater master of stage effect. If he violates probability in producing it, he compensates us by the profound impression he makes on our imagination. His comedies are often brilliant and ingenious. He added nothing in the way of character or motive to the material already at the disposal of the Spanish playwright, but he used it with more uniform skill. No single play of his deserves to be ranked higher than Lope de Vega's *Estrella de Sevilla*; but the general impression left by his works is that he was the more careful writer. He has produced nothing more brilliant than *La Verdad Sospechosa* of Alarcon, but he was unquestionably the greater man on the whole.

There is, however, one branch of dramatic literature in which Calderon has not only no equal, but no second. As a writer of mysteries, "autos sacramentales," he so far surpassed all his countrymen that they have become the main basis of his reputation, as indeed he appears to have always felt they would. On them must rest his claim to rank among great representative poets, his right, that is, to the title of "poet of the Inquisition." This epithet, first applied to him by Sismondi, has been rejected with indignation by his devotees, but he himself would have accepted it as a signal honour. Throughout his *autos* his great aim is to convey to the spectators the religious dogmas which it was the business of the Inquisition to keep from attack, and to adorn them with an often splendid lyric poetry, as, for instance, in the fine choruses of *La Cena del Rey Baltasar*. The Inquisition did not confine itself to burning Jews and heretics. It kept guard over the decency if not the morals of the nation at large. Much of the purity of language which Archbishop Trench admires in Spanish dramatic writers was the work of the Inquisition. In spite of Schack's poetical statement that the reader who first opens a Spanish auto sees a new heaven open over a new earth we may safely say that, putting matters of form and language aside, there is nothing to be found there which is not common to the mystic writers of the seventeenth century—to Juan de la Cruz, to Malon de Chaide, to Santa Teresa, and to many others. Calderon took the morals, and the dogmas which the Church thought right for its people, and clothed them with poetry. In his so-called philosophical plays he does exactly the same thing by means of secular characters instead of religious personifications. If to have put the teaching and creed of the Catholic Church when at its full logical development, and in that state of absolute mastery which it insists is its only true freedom, into poetry is enough to entitle a writer to the attention of all students of literature, and few will be inclined to doubt that it is, then no man is more deserving to be studied than this poet of the Inquisition.

Of the merits of Calderon's style it is hard for a foreigner to judge. He is often very obscure, so much so that his latest and best editor, Don Juan Hartzenbusch, declares that he is in passages unintelligible even to a Spaniard. But this is partly due to the badness of early editions with which actors and printers were in the habit of taking strange liberties, and though he was guilty of much affectation and "cultismo," yet when at his best he handles one of the noblest of languages in the noblest way. But against this must be set off much sheer rant and bad taste, a heaping up of sonorous epithets and metaphors which is intolerably tedious to readers trained on the classics, or taught to admire the dignity of Racine. Calderon's right to be praised for giving a high tone of honour to his characters would require greater space for proper examination than we can spare it here. Let the reader who is sufficiently master of Castilian take a play of the Spaniard's and compare it with a French piece, with which it has nothing in common but the name—we mean *On ne badine pas avec l'amour*, and the *No hay burlas con el amor*. The comparison will be fruitful in other respects, but it will certainly prove that Perdican, though a pitiful creature enough, is honour and manliness personified, as compared with the Spanish *galan* Don Alonso de Luna. This, however, Calderon shares with his fellow-dramatists, whose morality was that of the time—the most corrupt period of a nation, at all times false, cruel, and envious in action, in spite of lofty pretensions in speech, and of some amiable qualities. The subject of Archbishop Trench's Essay was an excellent specimen of his countrymen's best gifts, but was not much superior to their low moral tone. As a dramatist, he is a distinguished member of a large body of writers for the stage, who were very indifferent to character, using the same stock types over and over again, and careless as to nature or probability, but who in some respects understood the "optique du théâtre" and the construction of a lively intrigue as well as any men who ever lived. We cannot agree that he is entitled to be considered an original thinker or a great dramatist, but he is a brilliant playwright and expounder of Catholic dogma and morals as they were in Spain in the seventeenth century.

TWO MINOR TALES.*

MR. MARK CHORLTON never seems to weary himself, however much he may weary his readers, by the fulness of the descriptions that he gives of Cyprus. And yet we cannot feel at all satisfied that he has ever seen that island. He says that his hero, who tells his own story, went in a yacht to "Beatum (*sic*) Cyprum, as the old writers used to call it"; and that, after leaving it, he took a cruise to Syria. On their way home the yacht was wrecked, and for four days he and his comrades were buffeted about in an open boat. In all this there is nothing that might not be true, except the statement which implies an incredible ignorance of the rules of grammar on the part of the old writers. But here comes a gross blunder which would be hardly possible in any one who, however ignorant he may be of geography, knows anything of the eastern part of the Mediterranean. Mr. Chorlton says that the shipwrecked travellers were picked up in a most exhausted condition by a vessel on her way to Aden. Now certainly vessels going to Aden do pass through the Mediterranean, but then there are such places as the Suez Canal and the Red Sea. Of these we find no mention made by our hero. He and his friends are clearly taken to Aden against their will, as being the first port at which the ship stopped. If we are not mistaken, the place is thus dragged in with a total disregard of geography, so that Mr. Chorlton may have a chance of making what he considers a joke. "Although," he writes, "there is only *a* difference between Eden and Aden, I never saw any place in my life which was more unlike Paradise than the latter." We do not deny that a joke might be so good as to cover a multitude of geographical blunders. Mr. Chorlton, however, would certainly act more wisely were he to try to seek renown rather by a careful study of the map than by attempting to be humorous. His humour, indeed, is of a very heavy order. For instance, his hero visits the town of Curium. "Curium," he writes, "as its name would appear to imply, is a very curious place." In another part of the story he reports a speech made at a wedding-breakfast, in which the facetious orator tells the company that he had begun life as a betting-man, when he grew older and wiser he had become a better man, and was at last "the '*best* man.'" The hero's name was Gravenor. His companions, he tells us, called him Grave, and he was thankful that they did not call him Gravy. Compared with such facetiousness as this we are almost willing to allow that the author's display both of mythological learning and descriptive writing is worthy of praise. At all events, a certain amount of interest is for a moment excited when we read that it was in Cyprus that Prometheus was chained to a rock. We wonder whether the author knows some Promethean legend which has escaped our memory, or whether he places the Caucasus in Cyprus as he seems to have placed Aden in the Mediterranean. From Prometheus he passes to Othello. We regret to say, however, that "his interest in that individual considerably abated" after the account that he heard of him in the island. He tells us that Shakespeare—the world's William as he calls him—"has thought proper to paint him black, and endow him with woolly hair and swarthy features." It seems somewhat needless, by the way, to go on to endow a man with features that are swarthy when he had already been painted black. From this he proceeds to pass some critical remarks on the play of *Othello*, which an ignorant man might very easily make, even if he had not been to Cyprus. In an earlier passage Mr. Chorlton had brought his experience to bear on another statement of Shakespeare's. We will quote it at length as it gives a fair specimen of the author's style:—

> Albeit the world's William has pronounced men to be deceivers ever, and the "deceived" are only too glad to take this dictum as a text on which to preach us down, I must say, in self-defence, or rather in defence of my sex, that according to my experience, which has been by no means inconsiderable, inconstancy is not so much an inherent defect in human (male) nature as the result of a cause, namely, that the great majority of women are utterly and entirely incapable of calling into being a really lasting affection.

Cyprus, of course, affords a fine opportunity for that unhappy style of writing which is the invention of the present age, and which is known as word-painting. This style has certainly one merit—advantage, we should rather say. It is within the reach of the most ignorant of people, and requires no preparation beyond a careful study of a few worthless writers. It professes to be a description of nature, whereas it is nothing but a hash of a hash. Mr. Chorlton rings the well-known changes on a small peal of words, and produces one after another all those picturesque effects which are to be found nowhere but in the pages of novelists. Thus he tells us how the sky was deep blue and the sea was sapphire at the same time that the stars were shedding their soft, hallowing light, and the waves were chiming a sad song on the moonlit shore. If he ever does give a moment's thought to what he writes, he counts, no doubt, on the fact that

* *Love in Cyprus; or, The Fortunes of an Unfortunate Man.* A Novel. By Mark Chorlton. London: Moxon, Saunders, & Co.

Wothorpe-by-Stamford. A Tale of Bygone Days. By Catherine Holdich. Griffith & Farran. 1880.

such readers as he is likely to get will have spent all their evenings in rooms lighted by gas, and know nothing of the colour of either sea or sky after the sun has set. He writes, we may feel sure, "for eyes," to use his own barbarous English, "conventionalized by the formularies and æsthetics of fashion." In another passage he introduces his readers to a steel-blue sky, in which stars were flashing and glittering like jewels, while shimmering moon-beams — whatever they may be — were casting a chastening, tender light. The scene of his story is changed from Cyprus to England; but with the change of the sky there is no change in the mind of the writer. He goes on describing with the same exuberance of folly. He takes us into a nobleman's park, and disgusts us by writing about "a fleck or gleam of rose-colour from the beeches," and the bark of the birch that "shone with a sort of silvery sheen whenever a stray gleam of sunshine glinted upon it."

The story in *Love in Cyprus* does nothing to add any interest to the book. The hero falls in love with a Miss Methvin. She unfortunately was engaged to a cousin in America. Her lover in despair returns to England, and marries the only daughter of an earl. As he is utterly indifferent to his bride, he is not greatly distressed when she dies an hour or so after the wedding. He is now free, and fortunately Miss Methvin becomes in her turn free from her engagement. She writes to ask him to return to Cyprus. He finds her greatly changed. "Oh, Ely, what is it?" he exclaims, "tell me—tell me." She said huskily, "Cannot you see. *I am dying.*" She gets worse and worse, and to all appearance goes through the whole of the well-known dying scene of the last chapter of a novel. He either loses his reason for a time or becomes unconscious. Meanwhile she goes through a crisis in her illness, gets well, and marries the hero.

Wothorpe-by-Stamford certainly is not a long story. It might be read in an hour or two, if, that is to say, it could be read at all. Its faults are by no means the same as those which we have pointed out in *Love in Cyprus*. Indeed, of so different a kind are they, that we would recommend the conscientious reader, who is resolved to go through both these tales without skipping, to take them at one and the same time, and read a chapter in each alternately. Some kind of an interest might be found in contrasting the styles of the two writers. Mrs. Holdich is as bald as Mr. Chorlton is ornate. She as much creeps along the earth, in pattens if we may be allowed to say it, as he at times soars up to the sky. She is as homely as he is romantic. She is as ignorant of humour as he is restless in striving after it. While he has formed his style on the sensational novelists, she, it is clear, has gone for hers to the literature of tracts and of goody stories for young people. He believes that by striking scenes alone can the reader's attention be secured, and, therefore, he has recourse to foreign countries, a shipwreck, a sudden death, and complications in love. She thinks that whatever is got into a book must be worth reading, and, therefore, she has no hesitation in printing an amount of twaddle which would be intolerable even over an afternoon tea in the hottest August day. Her heroine tells her own story, and before long overwhelms the unhappy reader with despair by the account of her ancestors and relations. First she tells of "my father and mother," then of "my mother's father," who was rector of Hambleton, and next of "my grandfather, Maurice Fell." About this old gentleman she adds, "I never heard that he was otherwise than pleased when Claud Assheton asked for the hand of Margaret, his cousin." From this Claud, by the way, the heroine's brother got "the aquiline nose, or, as some called it, the Assheton nose," which distinguished his serious face. We have gone through not two full pages of large print, and are as yet a long way off the top of the family tree. We pass on and are introduced to "my paternal grandfather" and his family of ten sons and daughters, six of whom died of consumption between the ages of eighteen and twenty-five. The reader can scarcely repress the wish that the other four had been cut off by the small-pox or the hangman so early in life that there were no descendants of them left at the present time. From "my paternal grandfather" we pass on to "my paternal grandmother," and to their two surviving twin sons, and so begin to breathe more freely as we hope that we are near the last branches of the family tree. "I have heard my father say," she records, "it was a joyful day for them both when my mother came to Wothorpe, and when little feet pattered about the house—first a boy, Claud, and four years afterwards I, Ruby. And now I must say something about my brother Claud." But we are at once taken back to the deaths of a paternal uncle and a maternal grandfather. We come next to the married daughter, and the husband of the married daughter of either my paternal or my maternal grandfather—we fail to make out which—and a page or two later on we are introduced to a distant cousin, Frank Assheton. "He," we read, "was a fine-looking man." The heroine, however, forgets to say whether he had the far-famed Assheton nose. On the following page the family circle is still further enlarged. "We had two aunts—one married, who lived with my grandfather; the other, Aunt Bertha, was an especial favourite." A French lady, Mme. la Baronne de Maricourt, had taken the greatest liking to Aunt Bertha, and persuaded her to live with her in France and become her amanuensis. The French lady, it would seem, suffered from weak sight. At the time of some Revolution she had to flee from her country to England. Aunt Bertha, with a caution that seems excessive, wrote to the heroine's mother, who was going to receive the refugees, to remind her that, if ever they required concealment, there was under the staircase in her house at Wothorpe-by-Stamford a space large enough to hold several people. We have now safely guided our readers up the family tree, and brought them to the very edge of a mystery. Here we shall ask to part company, leaving it to them to satisfy the curiosity which may have been raised in their breasts by this hiding-place beneath the stairs.

CAMPAIGNING IN SOUTH AFRICA.*

WHEN we made Captain Montague's acquaintance several years ago, as the author of a novel called *Claude Meadowleigh*, we had occasion to remark on his fondness for metaphors which were not unfrequently either far-fetched or inappropriate or incongruous. But, though we detect similar blemishes of style in the somewhat over-fine writing of his *Campaigning in South Africa*, we gladly acknowledge that he shows to decidedly greater advantage when dealing with facts in place of fiction. His campaigning sketches are almost invariably graphic, and his reminiscences of weary marches and bivouacs are enlivened with pleasant touches of drollery. His descriptions give one an excellent idea of the character of the country that befriended the Zulus by masking the movements of those wily bush-fighters, and opposing obstacles to the lumbering march of the regulars. He has much that is interesting to say of the natives—as well of those who enlisted under British colours as of Cetewayo, his chiefs, and his warlike commandos—and he records besides his personal opinion of the generals and commanders of columns who led our troops to ultimate victory. His remarks upon the war operations from the strategical point of view must of course be taken for what they are worth. He says himself that the expedition was a series of disappointments to him, as well as to the men and the other officers of the 94th. It was the fate of that sorely tried regiment to drag in the rear of the advance, to protect communications, and occupy fortified posts which were neither attacked nor even seriously threatened. In such circumstances Captain Montague, though sometimes almost within sound of the firing in the actions that decided the tedious campaign, had really no better opportunities of informing himself than any other dispassionate spectator. Indeed, living as he did in an atmosphere of *canards* and camp "scares," and listening to the intelligence of native scouts who seem to have been equally gifted with imagination and caution, he was placed at an actual disadvantage as compared with writers in London who had opportunities of comparing the most trustworthy accounts. Perhaps many readers will think it a merit in his book that it seems to have been based on memoranda written from time to time, in which the first impressions have been seldom corrected by the subsequent lights of experience and reflection. It is not so much exact history as the report of the changing opinions that obtained in certain military circles among men who were on the border of the scene of operations. Thus it has an unmistakable freshness, and we have a conviction of its realism which makes it all the more agreeable reading.

There is a good account of the voyage out in an overcrowded troop-ship. The *China* is a commodious vessel of her class; but when an entire regiment has to be stowed away on board of a converted passenger-steamer, the men have to put up with an infinity of petty miseries which they never contemplated in taking Her Majesty's shilling. The *China* was a "Cunarder," built for the trans-Atlantic service, and she had of course to cross the Line and the tropics on the way to the Cape. A couple of companies were berthed in the "orlop deck," and they had to descend to their quarters in the bowels of the ship by a succession of ladders fixed in a "shaft which for its black depth might have led to a coal-mine." Below there was never a glimmering of daylight, and "by the dim light of the 'bull's eyes' could be seen the forms of men stripped to the waist, their bodies glistening with moisture, bending over the mess tables trying to read or fingering dirty packs of cards." Beneath the shaft was a hatchway, which opened on a magazine that made a receptacle for all stray articles that could be hidden out of the way. "When it was cleared out on disembarkation, all the property lost during the voyage was unearthed from its recesses—rifles, bayonets, straps, bags, boots, clothing, all rusty or rotten from the damp and heat." There was an unexpected and unwelcome delay at St. Vincent. Half a dozen troopships which had preceded the *China* were found lying at anchor in the open roadstead. Troops were urgently needed at the seat of war, yet it was physically impossible to despatch the shipping. There was an abundance of coals in store, but the facilities for coaling were limited; and the Admiralty and War Office had omitted to reckon with exigencies that were out of the every-day routine. After the tedious confinement in this floating prison, the disembarkation at Durban, notwithstanding its disagreeables, was *fêted* as a holiday. For the time discipline was inevitably relaxed; the men would tumble into the tiny tug, even when it was weighted down, till it was rolling gunwale under; and it seems a miracle that none of the heroes were drowned as they steamed through the surf and the rollers that break on the formidable bar. Once landed, it was literally out of the frying-pan into the fire. The South African sunshine was warm, and the progress of the troops was slow in the extreme. Captain Montague is no grumbler; he is merely a

* *Reminiscences of an Officer in 1879.* By Captain W. E. Montague, 94th Regiment, Author of "Claude Meadowleigh," &c. London and Edinburgh: William Blackwood & Sons. 1880.

faithful chronicler, who reports his experiences with a mingled sense of humour and resentment. But he had left his wife and his snug hut at Aldershot, full of anticipations of fighting and dreams of martial glory. And now he and his brother officers, with the sea-worn and much-enduring rank and file, were advancing by the slowest of stages parallel to the frontiers of Zululand, while the prospect of being in the thick of the fun appeared to recede rather than to draw nearer.

Perhaps it was the disappointment preying on his mind that made Captain Montague cynically disposed and somewhat unfair to the colonists. Explaining how general apprehensions had been abroad, he adds, "Nor was the panic to be laughed at. The Zulus had proved themselves a terrible foe; murder and fire were their only arguments; in a few hours they could overrun the colony, and that was defenceless." Seeing that the Zulus had already annihilated a British force of all arms, standing on the defensive in a deliberately selected position—which, by the way, in the face of the strictures of unprofessional critics, our author asserts to have been extremely strong—it was but natural that the inhabitants of open towns, whose lives and property and wives and children lay within easy reach of a light-footed enemy flushed with recent victory, should fortify themselves as best they could against probable and terrible contingencies. Yet a few pages afterwards, although the panic had subsided, he ridicules the Durban people for keeping up their defences. It appears to us to have been but natural that civilians and family men should be uneasy when, on Captain Montague's own showing, even our regular troops and their bravest leaders were morbidly apprehensive of Zulu onslaughts. He tells repeatedly how, on the strength of some vague rumour which nobody in authority found leisure to sift, a column threw itself into laager to receive the enemy, or began firing furious volleys on false alarms. "Lord Chelmsford," he says elsewhere, "has been blamed unjustly for his extreme caution during these early days, when the feeling which prompted it with him was equally shared by every officer in the camp." The fact is that the bravest men become timid under sustained mental strain and in face of unknown dangers; and the disastrous surprise of Isandula had overtaxed the firmest nerves in a country where everything favoured the savages. The delays that excited impatience at home, the seemingly inexplicable countermarching and changes of plan for which Lord Chelmsford was so freely blamed, were probably due to difficulties of the country which were imperfectly appreciated. This at least was the opinion of Captain Montague. "At a distance, no doubt, our delays and caution did seem excessive; but to any one on the spot, who could see the difficulties in the way of an advancing enemy through such a wonderful country as was Zululand where we crossed it, they would appear sheer necessities." Seldom are the first appearances of a country more deceptive. It seemed to be a gently rolling table-land, admirably fitted for the operations of cavalry, and very practicable for the ponderous ox-waggons. In reality these impressions proved utterly delusive. The bottoms of the valleys between the rolling swells were traversed by sluggish streams trickling through bog and swamp. The rank growth of the grass covered heaps of fallen stones, the remains of deserted cattle-kraals; and the ant-bears had been burrowing everywhere among the hard-baked mounds of the ant-nests. But the grand obstacle to the advance of a column was "the donga." "To picture a donga, we must imagine a thick slice taken bodily out of the earth; the slice itself has bodily disappeared, leaving in its place a yawning gulf. This may be from a dozen to a hundred feet across; its sides are absolutely perpendicular, with buttresses here and there, always sharp as knife-edges, jagged and irregular." It might be possible to make one's way across a donga on foot, but in a waggon or on horseback the feat was impossible. Then you had either to ascend its course till you could turn it, or to "prospect" it till you came to a place where engineering operations were practicable. And as dongas are perpetually recurring in Zululand, it may be imagined how an army must be encumbered by its waggon train, while its regular cavalry is practically paralysed. In these circumstances the Basutos on their clever little ponies became extremely serviceable. Captain Montague, who has but an indifferent opinion of our colonial and coloured auxiliaries in general, praises the Basutos highly. They showed themselves brave, active, and intelligent. At the same time they were equally distinguished by their cold-blooded cruelty, and it was their practice to make no prisoners while following up the enemy in retreat. Our author tells a story by way of illustration. A Basuto shot a flying Zulu through the legs and stopped the man. Sitting down by his captive, he lunched calmly, beguiling the time with cheerful talk, in which he persuaded the crippled Zulu to join. Then, having finished his meal, he closed the conversation with a friendly nod, and, casually remarking that he had serious business on hand, took up his carbine and finished the Zulu. It is not creditable to a civilized country to have to seek or accept the aid of such allies.

Among the most interesting passages in Captain Montague's volume are those relating to the scenes of the Prince Imperial's death and of the Isandula massacre. When Captain Montague's party paid their visit to the kraal beyond the fatal donga where the Prince came to his end, they found an old woman who had been left behind by her people, "hideous and ugly beyond words to describe." She jabbered away, and, as the interpreter assured them, boasted, in the intervals of promiscuous abuse, that it was her sons who had killed the Prince. And they came upon a piece of corroborative evidence, for on the floor of her hut was the Prince's shirt, "stiff with blood and pierced with assegai stabs." Not less melancholy were the signs of the fight at Isandula, though Captain Montague went over the ground many months after the disaster. In a country where the blazing sun bakes the earth to the hardness of brick it is no easy matter to bury the dead, and the bodies of animals must be left to decay where they fall. First the visitors came on an artillery cart, which had been hauled some distance by the Zulus and then abandoned. Next was a gun-limber with the Woolwich marks on it; one limber box still in its place, the other broken open and a hundred yards away. Soon the bodies began to lie thickly. "The Carabineers, who fell fighting bravely in a circle, with Durnford in the midst, lay a little apart. Wherever an ox or a horse had been killed there was a patch, and the whole field was covered with these tell-tale patches." The conical hill and the famous neck of land connecting it with the rock, and looking down upon "Fugitives' Drift," were studded with waggons—"some empty, many loaded up. Amongst the latter, several containing grain; the bags had rotted, and the oats falling out, had filled the waggon with black mould, from which the green leaves were springing brightly. In many waggons the oxen had been assegaied in the yokes, and lay in two ghastly rows, eight of a side, just as they fell. The slain were perfect, while through the assegai holes could be seen their last meal, now turned into chopped hay, for all the world looking as if they had been stuffed." With this vivid, though somewhat ghastly, bit of description we bring our notice to a close, merely adding that Captain Montague's book gives one the impression that our troubles with the Zulus are at an end for some time to come. Self-confident to excess in the beginning of the campaign, they changed their ideas altogether after Ulundi, and went to the opposite extreme. After being beaten in fair fight on their own chosen ground, they acknowledged that the white soldiers were the better men; and they have resigned themselves accordingly to be peaceable allies, so far as their peculiar idiosyncrasies may permit.

DIXON ON PROBATE AND ADMINISTRATION.*

MR. DIXON has succeeded in writing a very useful and a very interesting book. The law of Probate, as treated by him, is not confined to the mere process by which a will confessedly valid and sufficient meets with official recognition, but embraces all the questions which affect the validity of a document proffered as testamentary, and the rules according to which it receives or is denied that recognition without which it is ineffectual. By taking this wider field for his labours, Mr. Dixon is at liberty to discourse on the law of testamentary capacity, irregular execution, undue influence, and the variety of legal doctrines which constitute the more romantic aspect of the law of wills. At the outset we may also notice that he has incorporated with his work an able treatise on those provisions of the Judicature Acts which more immediately affect contested will cases—a treatise which, as it notices well nigh all the latest authorities, is of use beyond the limits of the class of practice to which it more immediately refers.

Obviously one of the first points Mr. Dixon has to consider is, "who can be a testator," and as all persons not under specific disabilities are naturally able to dispose of their property by will, we soon get to the important question of soundness or unsoundness of mind as affecting the validity of a will. With regard to this, Mr. Dixon rules in favour of the view expressed in p. 16, that "proof of general unsoundness is not necessary to negative mental capacity, and that one insane delusion, even though in all other respects the testator acted with perfect sanity, will suffice." It is a pity that Mr. Dixon's book appeared before the recent judgment of the Probate Division in the case of Mr. Smee was reported, because we venture to think that that judgment tends strongly to establish the more rational doctrine that, although the presence in a testator's mind of one insane delusion, co-existent with a large amount of sanity, may be sufficient to invalidate his will, yet this should be the result only where the delusion is of such a nature as may reasonably be supposed to have influenced the disposition of his property. Speaking of the few other disabilities recognized by the law, Mr. Dixon says at p. 26, "The executor of the will of a person found *felo de se* by a coroner's jury may prove the will, though the effect of the verdict is a forfeiture of the deceased's personal property to the Crown." And a little further on, "From this it is manifest that, though a felon's personal property is forfeited to the Crown, &c." In our opinion Mr. Dixon has misinterpreted the statute of 1870 to which he refers in a footnote. That Act absolutely abolished all forfeiture for felony, and specifically mentions suicide as having no longer the effect of working a forfeiture.

The year 1837 saw the commencement of a great change in all matters relating to wills. In that year the Wills Act was passed, which, besides introducing new incidents into the operation and effect of testamentary documents, substituted one uniform and indispensable system of execution for the somewhat bewildering variety of formalities which had till then obtained. This contrast Mr. Dixon somewhat weakens by incorporating with his exposition of the older system a number of remarks equally applicable to the new. The section of the Wills Act relating to executors provides

* *Probate and Administration, Law and Practice in Common Form and Contentious Business.* By W. John Dixon, Esq. B.A., LL.M. (Cantab.), Barrister-at-Law, of the Inner Temple. London: Reeves & Turner. 1880.

that no will shall be valid unless in writing, and signed at the foot or end thereof by the testator, or by some other person in his presence and by his dictation—such signature being, moreover, made or acknowledged by the testator in the presence of two or more witnesses present at the same time. Few enactments have been the subject of more litigation than this section, and some of the judicial refinements introduced into its interpretation have been almost ludicrous. Thus, a will otherwise duly executed was rejected because there was a space, eight-tenths of an inch wide, left at the bottom of the last sheet of the actual will, and the signature was placed on the next page; and questions have arisen as to how attestation was to be carried out in the presence of a blind testator. The Wills Amendment Act of 1847 was passed with a view to remedying the uncertainty as to what constituted "the foot or end" of a will; but that its success in this respect was but limited is demonstrated by the long list which Mr. Dixon adduces of cases decided upon this explanatory law. It is, however, consolatory to learn (p. 62) that "the general result of them appears to be, that when there is a *bonâ fide* endeavour to conform to the requirements of these Acts, failure in the strict letter of the law will not vitiate the will. It must be in the spirit also." Of course Mr. Dixon takes due notice of the important case of Sugden *v.* St. Leonards, which finally established the doctrine that when a will is lost parole evidence of its contents is admissible, and sufficient to secure the carrying into effect of its provisions; a doctrine which, in order to avoid fraud, must only be applied in exceptional cases, where the evidence is very clear and above suspicion.

The Wills Act, besides introducing new formalities to be observed in the making of a will, laid down fresh rules as to the methods and contingencies by which a will may be revoked; and the present work concisely tabulates the states of the law on this point before and after the above-mentioned enactment, including revocation of a will by subsequent marriage of the testator—a change of circumstances which, though partially recognized as an implied revocation prior to the Wills Act, was then first exalted to the position of a definite and express revocation of a former will. An apparent inconsistency arises with regard to revocation by marriage, inasmuch as, under the Wills Act, a will is held to speak from the death of the testator, after which there can of course be no question of his marriage. It must, however, be taken that, for this purpose, the date of the will becomes material and not the date of the testator's death. An interesting chapter is devoted to contingent wills—that is to say, wills which the testator obviously intended should take effect only on the occurrence of certain contemplated events. With regard to these somewhat anomalous documents, Mr. Dixon holds, and apparently rightly holds, that if the contemplated contingency does not occur, the will is *ipso facto* revoked, although the testator may by subsequent recognition adopt the same will as his in all events, independently of the failure of the originally imposed condition. It is sometimes rather difficult to decide whether a will is really contingent, or whether what at first sight might be taken as a contingency is not really only an expression of the testator's reason for making the will. Thus, in a case quoted at p. 159, "Lest I should die before the next sun, I make this my last will," was held to fall within the latter, not the former category; while a will containing the words, "In case of accident I sign this my will," was held to be contingent.

With a view, as he says, to preserving continuity of purpose, Mr. Dixon, having dealt with the usual attributes and incidents of a will, turns to the consideration of the persons on whom devolves the duty of carrying that will into execution—namely, the legal personal representatives, be they executors or administrators. About the office and duty of a regularly appointed executor there is but little new to be said; and Mr. Dixon has done wisely in occupying himself mainly with the more abstruse questions relating to "executors according to the tenor," or those who, though not specifically named as executors in the will, are yet so charged with the carrying into effect its provisions as to be placed in a strictly analogous position, and "executors *de son tort*," or those persons who, not having been named at all in a will, yet, by officious intermeddling, render themselves responsible for the completion of that which they have thus undertaken. Ample illustrations are given of the language and circumstances by which persons may become executors under one of the above denominations, as also information with regard to the method by which one named as executor may renounce the office, or even afterwards retract such renunciation if he be so minded. In relation to this branch of his subject Mr. Dixon has, however, adduced two cases in p. 212 which appear inconsistent, or at least to require further explanation. He says:—"Seizing the testator's goods, claiming in error a property in them himself, does not render him liable as executor"; and a little lower down:—"By taking possession of the testator's goods, and converting them to his own use, or disposing of them, he has intermeddled, and cannot renounce."

The question of domicile is in some cases material with reference to wills, and the author of the present work, whilst modestly referring his readers for fuller information to works more specially devoted to this subject, allots a certain amount of space to it. In saying, as he does at p. 261, that wills "are not valid unless executed in conformity with the law prevailing in the country where the testator is domiciled," Mr. Dixon states his proposition a little too broadly; inasmuch as he omits to notice the exception introduced by the Domicile Act of 1861, which provides that every will made out of the kingdom by a British subject, whatever be his domicile at the time of making such will or at death, shall, so far as regards personal estate, be held to be well executed, and admitted to probate, if made according to the forms required either by the laws of the place where it was made, or by the laws of the domicile, or by the laws of that part of her Majesty's dominions where the testator had his domicile of origin; and, moreover, by the same statute a will made in the United Kingdom by a British subject domiciled abroad is held good if executed according to the form required by the law of that part of the United Kingdom where it is made. It is but fair to add that Mr. Dixon states the effect of this statute rightly later on, in p. 274.

The law is peculiarly solicitous with regard to the testamentary disposition of soldiers and sailors. Recognizing the unbusiness-like and impulsive habits of the latter class it has girt about with special precautions and formalities—such as attestation by the captain, the officers of a naval hospital, a justice of the peace, or other specified responsible person—the wills of petty officers and seamen not on actual service, when such wills are designed to pass prize money, wages, or other moneys acquired by their calling. At the same time, acknowledging the perils of service by land or sea, and following out, as Mr. Dixon remarks, the traditions of the Roman law, various statutes have permitted soldiers and sailors on actual service and in case of emergency to make wills by word of mouth, known as nuncupative wills. These provisions extend to officers as well as men; but in the case of soldiers the scope of the Acts has been somewhat narrowed by a decision that the term actual military service is to be construed as equivalent to "being on an expedition."

Although not strictly coming under the head of Probate, since in such cases there is nothing to prove, Mr. Dixon has included in his work a dissertation on administration under an intestacy, and the distribution of an intestate's property amongst his next of kin. His treatment of the practice of the Court, both in contentious and non-contentious business, is very full and clear, including the summary of the provisions of the Judicature Acts before referred to; but these portions of the book we pass over as lacking general interest. There is also a very copious appendix containing the statutes, rules, and forms now in force with respect to matters connected with wills, so that the book is self-contained, and, save for the cases cited, dispenses with external reference. This advantage is not, however, attained without some sacrifice of portability, as the volume is of a rather portentous size.

GERMAN LITERATURE.

SOLDAN'S History of Witchcraft in connexion with legislation, first published in 1843 (1), is one of those works which, in their original shape accessible only to a learned public, filter down to the general public through the medium of compilers and appropriators. It has now been thoroughly revised and in part re-written by the author's son-in-law, himself recently deceased; but, notwithstanding the great additions made in the interim both to the history of superstition and the history of jurisprudence, the framework of the book remains substantially the same. All subsequent research has tended to corroborate Soldan's conception of the origin of magic, which may be regarded as a barbarous natural theology, that residuum of the original beliefs of primitive man which proves finally irreconcilable with reason and experience. In Caffraria the magician is the wisest man of the community; in modern Europe he is one of the most ignorant; unless, as with Roger Bacon, the character is forced upon him by popular prejudice, or, like Cagliostro, he is a thorough charlatan. This alliance of magic with exploded beliefs naturally brought it into a close connexion with heathenism, and to this cause, Soldan considers, the systematic persecution it underwent is principally to be ascribed. We hear but little of such persecution in Mohammedan countries, but in Christendom, honeycombed with strange mystical sects retaining vestiges of Paganism and Manicheism, magic and heresy were not easily distinguished, and, in fact, continually ran into each other. Soldan shows very clearly how persecution for witchcraft grew out of prosecutions for heresy, and applied all the ideas and principles already recognized in the latter. They first became fully developed as a branch of ordinary procedure in France during the fourteenth century, culminating in the atrocious persecution of the Templars. It is significant of their ecclesiastical character that they almost died out in France at the end of the century, when Papal authority was paralysed by the great schism. They spread, however, into other countries, being everywhere encouraged by the Inquisition. The resistance offered to the inquisitors in Germany led to two events which mark an epoch in the history of witchcraft. One was the publication of that famous demonstration of Papal fallibility, the Bull of Pope Innocent VIII. against sorcery, *Summis desiderantes*—the other the compilation of the *Malleus Maleficarum*, the classical authority on the subject from the inquisitor's point of view. From this time the persecution became systematic, and the simultaneous efforts to repress heresy by similar methods, conspired with occasional outbreaks of the epidemical demonomania to which every age is liable, to render ages of growing enlightenment more infamous for the atrocities practised upon the most helpless members of society than the dark ages had ever been.

(1) *Soldan's Geschichte der Hexenprozesse.* Neu bearbeitet von Dr. Heinrich Heppe. 2 Bde. Stuttgart: Cotta. London: Williams & Norgate.

Soldan investigates the progress and decline of this ghastly superstition with extreme diligence, and, without becoming tedious, he has written this dismal chapter in the history of humanity at sufficient length. An appendix, added by the editor, treats of the various attempts which have recently been made to establish a groundwork of reality for the belief in witchcraft, most of which, Herr Heppe thinks, arise from unacquaintance with the text of the judicial proceedings.

The correspondence of F. C. Weber (2), agent for George I. as Elector of Hanover at the Court of Peter the Great from 1714 to 1718, is not so absolutely confined to the affairs of the unfortunate Czarewitch Alexis as might be inferred from the title-page prefixed to it by Professor Herrmann. The letters relate in a great measure to the politics of the Baltic States, George's differences with Denmark having led him to ally himself with Charles XII. of Sweden, and thus incur the enmity of Peter the Great. The numerous references to Alexis, although highly interesting, add little to our knowledge except by confirming the belief in the existence of a conspiracy, in which his own share was probably merely passive, to depose his father and place him on the throne. A general massacre of foreigners was simultaneously to take place, and the ancient order of things was to be restored. The statement is confirmed in an anonymous correspondence published as an appendix, and no doubt conveys the substance of the confessions of the alleged conspirators, which were, however, for the most part extorted by torture. There are no additional particulars respecting the death of Alexis himself. Weber was a man of great capacity, and apart from his diplomatic correspondence is an important authority upon Russian affairs, being the author of *Das veränderte Russland*, published anonymously some years after the date of his mission. His letters contain many incidental illustrations of the barbarism of the country at that period, although he appears to have seen no part of it except the new capital. Abundant instances continually occur of Peter's energy and indefatigable efforts to advance the material interests of his country, as well as of the discontent created by his innovations.

In the interesting pages of C. von Höfler (3) the excellent but unpractical Flemish Pope, Adrian VI., becomes a typical figure, representing the piety and seriousness of the Teutonic race, in contrast to the levity, secular spirit, and mere ceremonialism imputed to the Latins. Ritter von Höfler's imagination is impressed by the circumstance that, since two or three obscure and ephemeral pontiffs in the eleventh century, no one not of Latin race has been elevated to the Papacy except the two Adrians, the Fleming and our own countryman, Nicolas Breakspere. The fact is sufficiently decisive as respects the œcumenical pretensions of the Roman See, but it is not from this point of view that the writer considers it. To him Adrian represents what the Papacy might have been had it been allotted to the Germans instead of to the Italians. The principal objection to this manner of viewing the subject is its tendency to aggrandize the figure of the exemplary Adrian, and make him a kind of Papal Agis, who succumbed in the unequal strife with a degenerate age. In fact, as the Reformers found to their cost, the Church of Rome was perfectly capable of the amendment she so greatly needed, only it must be attempted by methods suitable to her traditions and genius. Adrian undoubtedly mismanaged his undertaking, but it must have failed at the time in the hands even of a much abler man, simply because the public opinion essential to its successful execution remained to be created. The progress of Luther, the defection of England, and the sack of Rome had not yet occurred to bring ecclesiastics to their senses. When these events had taken place a very considerable reformation in manners and discipline was effected with general assent under the auspices of one of the most worldly of the Popes. Ritter von Höfler's exaggerated estimate of Adrian does not, however, interfere with the general fidelity of his narrative. The principal exception to which his really agreeable and erudite labours are liable, is that of over-minuteness; or the work might perhaps be correctly characterized as an amphibious composition between biography and history, too concise for the latter and too detailed for the former. Adrian's own actions and sayings are too insignificant, or perhaps too imperfectly recorded, to sustain or animate a long narrative, and the peculiar picturesqueness of his attitude as a Puritan Pope in the age of the Renaissance admits of being expressed within a narrow compass. Ritter von Höfler's main thesis, that Adrian's name deserves to be identified with the semi-reformation of the Roman Church in the sixteenth century, will not bear examination. Nothing can well be more certain than that events would have followed substantially the same course if Adrian had never existed.

Dr. Karl Brünnemann's life of Robespierre (4), according to the author himself, is designed as a reply to an unfavourable biography of the revolutionary hero. We share Dr. Brünnemann's apprehensions that the German public, having the bane and antidote both before them, will prefer the former, not so much for the reason assigned by him, that the assailant has been fortunate in his publisher, as because the assailed has been singularly unfortunate in his advocate. Dr. Brünnemann is a very poor writer, whose style is low and creeping, and whose measure for all things and persons indiscriminately is the estimate formed of them by his captious and jaundiced hero. His historical treatment of his subject is inexcusably superficial. It nowhere appears what the "unused sources" to which he claims to have resorted may be, but it is sufficiently evident that they can be of very little importance. He nowhere mentions Hamel, the great authority for Robespierre's life on his own side of the question, for an abridgment of whose comprehensive biography the German public might have really been indebted to him. He passes with incredible lightness over those actions of Robespierre which require the most apology, such as the execution of Danton, and fills his book with long extracts from his speeches, dreary reading though in the original, and utterly unreadable in a tame German translation.

Iceland (5), like Norway, is on but uneasy terms with the larger State with which she is connected by a personal union, and claims a measure of independence which the latter is indisposed to accord. The Icelandic question attracted some attention in Germany while the Schleswig-Holstein question was yet unsettled, and Professor Maurer, an authority on the jurisprudence of the Northern nations, was accustomed to report upon it from time to time for the information of the German public. He has now republished his essays with additions, and, allowing for an anti-Danish bias, excusable in consideration of the circumstances of Schleswig-Holstein, his volume presents probably a fair, certainly a lucid and interesting, summary of the history and grounds of the Icelandic agitation for a modified autonomy. The Icelandic "Alding," or national assembly, so famous in the early history of the island, after having almost fallen into oblivion and been actually abolished in 1800, was revived by a royal rescript in 1843. The political changes occasioned by the revolutionary disturbances of 1848 threw power at Copenhagen into the hands of a democratic party, in one point of view exceedingly liberal, but in another bent on destroying all local privileges, and consolidating the various States of the monarchy into a single political organization. The history of Iceland since this date is one of resistance to this centralizing tendency, and of endeavours to obtain more satisfactory financial arrangements and the abolition of monopolies designed for the advantage of Denmark. The latter object seems to have been fully attained, and the former in a considerable degree. Dr. Maurer's volume is concluded by a short memoir of the late Jon Sigurdsson, the ablest representative of the Icelandic popular party, and at the same time the most eminent modern Icelandic author and editor of ancient Norse literature.

Dr. Rohlfs's "History of Medicine in Germany" (6) is chiefly designed for professional readers. By them it will be found interesting and valuable, although somewhat needlessly circumstantial. The present volume, which is the second of the biographical division of the book, contains the lives of only four physicians in the strict sense of the term, and the only one among them of European reputation is the illustrious botanist Sprengel. Four eminent accoucheurs, however, are added, for whom the distinction is claimed of having been the principal reformers of the obstetric branch of the profession in Germany. Their memoirs, diffusely written, but not devoid of interest, are accompanied by copious extracts from their writings and elaborate bibliographies.

Meyer's *Jahrbuch* (7) pursues its useful career, and continues to deserve a high place among the publications which aim at giving an annual review of the intellectual activity of mankind. It is, of course, impossible that such a review should be complete, and the choice of topics may occasionally appear capricious; in general, however, they are selected with excellent judgment and treated with much ability. Among papers on specifically English subjects may be noticed a review of recent English literature, an estimate of the British school of painting, and a narrative of the Afghan campaign. All the summaries of recent politics and contemporary literatures are very impartially treated; but perhaps the most valuable contribution to the number is a notice of the recent advances of the theory of evolution, by Dr. Krause, known in this country as the biographer of Erasmus Darwin. The problem of the ancient luxuriant Polar vegetation receives especial attention. The archæological department is also well represented, and there are very useful plans of the excavations at Ilion, Ephesus, and Olympia.

The success of the *Shakspeare-Jahrbuch* has probably suggested the establishment of an annual devoted to Goethe (8). There should be no great difficulty in maintaining one, for not only is the variety of Goethe's writings infinite, but biographical materials are as abundant in his case as they are scanty in Shakspeare's; and the persons who may fairly be brought into connexion with him are innumerable. Hermann Grimm opens the first volume with a notice of one of the most interesting of these persons, Bettina von Arnim, whom he knew intimately in her old age. Like others who were acquainted with her, he was greatly impressed by her

(8) *Goethe-Jahrbuch.* Herausgegeben von Dr. L. Geiger. Bd. 1. Frankfurt: Rutter & Lœning. London: Williams & Norgate.

wit and vivacity and her remarkable power of instilling enthusiasm into less impassioned natures. Herr Grimm states that the style of her familiar correspondence is much inferior to that of her published letters, which seems a good argument against the perfect genuineness of these latter much-disputed compositions. Thirty-six letters from Goethe himself are also published, mostly belonging to the later period of his life, and unimportant in subject, but all characteristic in expression. A manuscript of "Prometheus," from a copy belonging to Frau von Stein, offers some interesting variations. There are also a collection of notices of Goethe by his contemporaries, several critical essays, of which one on the "Helena" is perhaps the most important, and a chronicle and bibliography for the year.

Herr Leopold Katscher's sketches from English life (9), though making no pretensions to initiate his readers profoundly into its mysteries, depict some of its external aspects with a lively and attractive touch. Papers on the English Universities, the postal and telegraphic systems, and the London clubs, convey much really valuable information in a very pleasant style, while "Subterranean London," the East End and Metropolitan charitable institutions, of which six types are selected for especial illustration, form the subjects of less elaborate articles. An appendix treats of some of the minor but suggestive curiosities of the day, such as Mrs. Girling's Shaker community, and Dr. Richardson's projected "city of health."

Chamisso's poems on the cycle of female existence, (10), with its capital incidents of betrothal, espousal, and young motherhood, are well adapted for illustration, and have received ample justice from Herr Thumann, who has created or selected an extremely pretty type of feminine attractiveness. The illustrations, as well as the poems, may be censured for an excess of sentiment, but in both cases sentimentalism stops far short of silliness.

There is considerable power in A. Fitger's tragedy "The Witch" (11). A high-born maiden's love of study and freedom of thought bring her under suspicion of sorcery, and a tragic catastrophe ensues. But the play, like the heroine, is too bookish.

By much the most important contribution to the *Rundschau* (12) is the Russian memorandum on foreign policy drawn up in 1864, which has already been widely circulated through the press. Dr. Pauli contributes a paper on an interesting though subordinate figure in English history, Mary Tudor, sister of Henry VIII., consort of Louis XII. of France, and afterwards espoused to the Duke of Suffolk, who nearly lost his head in consequence. Henry appears in the same unamiable light as elsewhere. An article, by Karl Hillebrand, on the occasion of the fiftieth anniversary of Belgian independence, gives a very satisfactory account of Belgian progress, and Belgian literature is illustrated by a pretty story translated from the Flemish of a deceased Belgian authoress, Rosalie Loveling. "Natanael," by Marie von Olfers, is also a good story, Herr Rodenberg's essay on the relations of national literature to universal literature is interesting, and there is much that is very curious in Rudolph Genée's account of the rudimentary beginnings of the German drama. A paper on the Etruscan problem is chiefly remarkable for its injustice to English philological science. Mr. Isaac Taylor's theory of the Altaic affinities of the Etruscan language is classed among the paradoxes which have brought discredit upon the inquiry altogether, and the exclusive credit of a scientific investigation of the subject is attributed to the German philologist Deecke. Yet, at the end of the paper, we are informed that Deecke has all but embraced Mr. Taylor's hypothesis, which becomes quite another thing when it has converted a German.

No. 1,296, Vol. 50. August 28, 1880. [Registered for Transmission abroad.] Price 6d.

IRELAND.

DURING the past week three entire nights, including a sitting on Thursday which did not finish yesterday morning, were devoted by the House of Commons to considering the grievances of Irish members. The eloquent outpourings of Monday and Tuesday were merely preludes to the discussion on the Constabulary Vote, which kept the Chairman of Committees out of his bed all Thursday night. Even before this point was reached a considerable debate had arisen on Thursday as a consequence of Mr. FORSTER's imprudent utterances in the earlier part of the week. Nothing could be more forcible than the manner in which the late Attorney-General for Ireland insisted on the unwisdom of connecting a future Peace Preservation Act with some fresh attempt to curtail the rights of landlords. It was in vain that Mr. FORSTER disclaimed the obvious inference which, inside and outside the House, had been drawn from his words by friends and enemies alike. His final assurance that he acknowledged the duty of the Government to carry out the law as it stood could not obliterate the fatal effect of his former suggestion. When the main subject of quarrel was reached the matter became one of simple obstruction, conducted on the old lines of three years ago, between a body of Irish members and the House of Commons. Few speeches were made, save by Irishmen; but Mr. BRIGHT maintained the reputation of his Government for persistent blundering by arguing that the Irish Constabulary were an evil necessarily consequent on the greater evil of Irish landlordism. How much may be added to the Session by the proceedings which began on Thursday night and ended at midday on Friday it is impossible to tell.

The anarchy and lawlessness of Ireland is a natural result of the reckless license which modern weakness or toleration allows to political agitators. Public and private morality largely depend on the assumption that recognized principles and rules of conduct are beyond the range of discussion. The existence of property, which is probably indispensable to civilization, is endangered when the right of ownership once becomes a subject of controversy. No demagogue at present ventures to propound a general vindication of robbery and murder; but the Irish agitators excuse crimes committed against landowners; and every crime loses a part of its tendency to shock popular opinion when it is openly and safely vindicated. In one of the late debates in the House of Commons several Irish members extenuated the detestable crime of mutilating cattle as a mode of injuring their owners. They pretended, indeed, that they had no sympathy with cruelty to animals; but they argued that it was much less criminal to ill-treat a horse or a cow than to evict a family of human beings. In other words, one of the vilest actions which can be perpetrated by a savage population was placed on a level with the exercise of a legal right. One Home Rule member after another professed full concurrence in the sentiments and language of Mr. DILLON, which had been justly stigmatized by Mr. FORSTER as wicked, and perhaps imprudently denounced as cowardly. They, of course, bore witness to the courage of the reckless declaimer, and some of them further boasted that Mr. DILLON was the son of one of the accomplices in the wretched little rebellion of 1848. It was perhaps imprudent to make a charge which it would be difficult to prove. Mr. DILLON invited his ignorant hearers to perpetrate crimes involving a risk of punishment to which he would not himself be liable. Mr. FORSTER could not know whether he was influenced by an undue regard to his personal safety.

At nearly all the late meetings promoted by the Land League resolutions have been passed against the payment of rent. In some instances the defiance of law is accompanied by the condition that rent shall only be withheld until Parliament shall have reformed the Land law to the satisfaction of the peasantry and the agitators. It is obvious that, if no payment is to be made [illegible] time, an Act which should fall short of [illegible] tion would be unacceptable, inasmuch as it would alter the condition of the tenants for the worse. Some of the Land League orators affect a facetious benevolence and moderation. The tenant is exhorted to provide not only necessaries but comforts for himself and his family, to pay his debts in full to the shopkeeper, and to the kind neighbour, otherwise known as the village usurer, who has lent him money, and then if a surplus remains to employ a part of it in keeping the landlord from starvation. Extravagant and profligate doctrines lose no other vicious quality by repetition; but they cease to be startling and strange. Any small gleam of conscience which may still remain is rapidly obscured by the promulgation of the theories of the Land League. The fraudulent debtor is not required to understand the sophisms which are propounded on his behalf. It is enough for him that fluent speakers have discovered and circulated some kind of apology for dishonesty and violence. In former times it was held that invitations to breakers of the law were to be punished and repressed as rigorously as the acts which they suggested and defended. The liberality or cowardice of the present day exposes a credulous populace, without interference, to the instigations of the worst class of demagogues. In anticipation of a possible revival of vigour on the part of the Government, the agitators have recently taken measures to prevent newspaper reporters from providing evidence which might be used in criminal prosecutions.

It is in defence of the lawless proceedings of the Land League that Mr. PARNELL, Mr. SULLIVAN, Mr. BIGGAR, and their allies declaimed with wearisome iteration in the House of Commons. Mr. PARNELL asserts that the bad landlords form either a majority or a large minority of the whole number; but his agents and followers in Ireland draw no distinction between good landlords and bad, and it must be admitted that they are consistent and logical. Legal rights cannot depend on the moral qualities which may be associated with their exercise. The tenants are urged to withhold payment of rent equally from liberal or exacting landlords; and the heads of the party openly or tacitly approve the proposal. Some, indeed, of the members who are pledged to Home Rule, and who acknowledge in a greater or less degree the leadership of Mr. PARNELL, occasionally protest against the monstrous schemes of spoliation which are proposed by the extreme demagogues. Mr. MITCHELL HENRY pathetically complained of the hardship which he might himself suffer, if all his outlay and exertion for the benefit of his tenants were rewarded by an arbitrary repudiation of their liability to pay their rent. Having ample means elsewhere, he was comparatively indifferent to the loss of money; but the injustice of the Land League and its disciples gave him intelligible pain. Landlords less fortunately situated will, if the agitation succeeds, incur total ruin. The demagogues have long ceased to confine their vigilance to cases of eviction. Any alternative mode of

enforcing the rights of property involves the same consequences. The assassination of landlords is generally not proposed in the speeches of the meetings, but it takes the form of a response from the sympathizing chorus of hearers. Less hesitation is felt in advising that the successor of an outgoing tenant shall be subject to social excommunication, or that, as the heroic Mr. DILLON observes, cattle pastured on the land shall not be likely to thrive.

It is surprising that the revolutionary faction within and without the House of Commons has not taken greater advantage of the pretext which might have been furnished by the rejection of the Disturbance Bill. One Irish member, indeed, has since undertaken, with the aid of half a dozen obscure English demagogues, the abolition of the House of Lords; but the Land League seems to acknowledge that a temporary suspension of evictions in certain districts for a limited time would have done little to satisfy the appetite for wholesale robbery. In one of the late debates Mr. GIBSON called attention to the remarkable fact that not one of the recent outrages would have been prevented if the Disturbance Bill had been in full operation. Its only effect, which indeed has to a great extent actually resulted from the introduction of the measure, would have been to give Parliament's sanction to the proposition that the right to rent is provisional and defeasible. Lord HARTINGTON used conventional language when he asserted that the rejection of the Bill had increased the difficulty of governing Ireland. Mr. FORSTER may be excused for attributing bad consequences to the failure of a mischievous project into which he blundered without due premeditation. He may easily be believed when he declares that, but for a sense of duty, he would gladly be relieved from his difficult office. The various embarrassments which beset him in administration and in debate explain and partially excuse some inconsistencies and apparent vacillation, interspersed with promises, which are not always prudent. One entire night in last week was taken up with the discussion whether Mr. FORSTER had been justified in giving moderate expression to the feelings which are shared by all respectable members of every party in the House. An opponent on the other side might perhaps complain that Mr. FORSTER seems inclined to compensate for past indignation by undue compliance with unreasonable demands.

From that part of his language on Tuesday last which was not disputed during Thursday's sitting, it may be conjectured that Mr. FORSTER is at last beginning to reconsider the expediency of obtaining additional powers for the maintenance of peace in Ireland. He announced that, if the necessity arose, the Government would not hesitate to call Parliament together to pass a Coercion or Peace Preservation Bill. It would have been much better if the late Act had not been allowed to expire. It cannot be too often repeated, in answer to vulgar commonplaces, that there is much greater hardship in permitting license than in placing moderate limits on liberty which is notoriously abused. Men are not slaves because they are forbidden to carry weapons which have no object except the perpetration of outrage and murder. It is equally consistent with rational liberty to check the circulation of incendiary papers. The announcement of a conditional readiness to discharge a primary duty would have been more satisfactory if Mr. FORSTER had not at the same time suggested the probability that he might introduce a simultaneous Bill to restrict the remedies allowed by law to landlords. One Disturbance Bill is quite enough, without a second gratuitous admission that those who seek the aid of the law are responsible for its violation. The Government has already gone too far in vague promises of modifications of the Land-law in a future Session. The extraordinary step of transferring the inquiry into Irish tenure to a second Commission has not thus far produced the expected result. The Land League refuses to furnish information to Mr. GLADSTONE'S Commission; and consequently the Report will be repudiated by the agitators as far as it fails to embody their demands. The Government which proposed one anomalous measure may possibly attempt to establish by law some arbitrary distinction between good and bad landlords; but it is the duty of Mr. FORSTER and his colleagues to keep the peace and enforce the law, without imposing conditions on the peaceable part of the community. A new Disturbance Bill, among other untoward results, would complete the disruption of the Liberal party.

AFGHANISTAN.

A LETTER has been received from General PRIMROSE describing the sortie of the 16th. He states that, on that day, his troops attacked the village of Deh Kwajee and got through it. It was found to be strongly occupied, reinforcements were sent up from the neighbouring villages, and then the British troops retired. The loss of the enemy is stated to have been heavy, principally through two charges of British cavalry. Nothing is said of our own loss; but it is known from a previous despatch that several officers fell and one hundred and eighty men were killed or disabled. The village against which the sortie was directed is on the east of Candahar, and Candahar is said to be invested by the local forces of AYOUB KHAN, the regulars and irregulars, while he, with his Heratee regiments, is encamped three miles on the western side of the city. It is not quite clear what was the object of the sortie, and, as that is unknown, it cannot be decided whether the sortie was successful. Those who were sent out must have been meant to come back again, for there is no reason to suppose that it was intended to detach a portion of the garrison, and hold an outpost which, from its position, would have been untenable, and the occupation of which would have changed the whole system of defence. General PRIMROSE makes no reference in his letter to the purpose or the result of the sortie; but former despatches from Candahar state that the sortie has secured the garrison from molestation on the eastern side. We, however, also hear that nothing like a regular siege is being carried on. The enemy throw shells into the city, but only occasionally, and without effect. As no guns were taken, and as the position was left in the hands of the Ghazis, it cannot be that the molestation from which the sortie relieved the garrison was that of a position from which artillery could be used with special effect. There could have been nothing like an intention to put an end to the siege by the employment of that superiority which discipline, the memory of countless victories and better arms, may be supposed to give an English commander, even in face of a native force numerically superior. For the strength of the Afghan army is in the covering force of AYOUB KHAN, and it was not in his direction that the sortie was made. There is, however, always the possibility that the investing force may make a desperate effort to take the city by storm, driving the garrison into the citadel. To anticipate this, it may have been thought prudent to give the Ghazis a lesson, and to let them know how they would be made to suffer. Candahar is a strong fortress of the Oriental type; but it has the unfortunate peculiarity of being surrounded by hills with villages in them to shelter besiegers, and with walls, gardens, ditches, and canals interposed between, so that it is very difficult to dislodge those who hold the heights. Of all these eminences, that of Deh Kwajee appears to be the nearest, and it was, therefore, from that quarter that an attempt to storm the city would probably be begun. General PRIMROSE may, therefore, have thought it worth while to inspire those posted there with a dread of British arms. From this point of view the infliction on the enemy of great loss would be the principal object he would have endeavoured to secure, and the attainment of which he would specially notice. Our loss was heavy, especially in officers, but the success or failure of the sortie may have depended, in the eyes of the General, entirely on the proportion it bore to the loss of the enemy.

As General PRIMROSE is acting entirely on the defensive, and it is thought to be satisfactory that, in one direction at least, he and his garrison are secure from molestation, all immediate interest is concentrated on the attempts that are being made to relieve him. All seems to have gone well with General ROBERTS up to the last date of which anything was heard of him, and he was expected at Khelat-i-Ghilzai on Tuesday last. That he actually got there when he was expected is not known; but enough is known to make it reasonable to suppose that up to that point his difficulties would be merely the difficulties of marching, and that he would meet with no active opposition. But, from Khelat-i-Ghilzai to Candahar, although the distance is short, he may probably have to cut his way. As the tribesmen are swarming round Candahar they will probably swarm on the road to Khelat-i-Ghilzai, and there is said to be one special spot on the route, called the Poti Pass, where to overcome anything like a deter-

mined resistance might cost him a considerable effort. The road is described as having there a steep and precipitous fall into the bed of a stream; and as the spot is only about thirty miles from Candahar, AYOUB KHAN might be able to send with ease a force sufficient to dispute vigorously a pass where the natural advantages would be so greatly on the side of the defenders. Ingenious correspondents have also selected other spots where resistance is to be attempted, and have even pointed out a shrine, not far from Candahar, where they say the last stand is to be made. No one can really know any of the details of a resistance which has not yet begun; but it is clear that the nature of the ground through which General ROBERTS will have to pass towards the end of his march favours resistance, and that the nearer he gets to Candahar the larger will be the forces that can be speedily and conveniently sent to resist him. That any resistance that can be offered will baffle one of the most enterprising and skilful of English generals with ten thousand picked troops under his command, and in the direction of an undertaking to the possibility of which he has pledged himself, is incredible. But his appearance at Candahar may be later than is anticipated, and he may have to suffer losses which will in some degree diminish his fighting power. His bold march has unfortunately now a justification which it did not seem to have originally. If he does not relieve Candahar, there may for a long time be no one to relieve it. General PHAYRE seems paralysed. First, the railway broke down, then transport was found to be almost non-existent, and then forage began to fail. He has not been able to get his troops up without great delay, and now cannot send them forward, or can only send them forward with much difficulty. Nor is this all. It is said that the troops of the Khan of KHELAT have mutinied, and that General PHAYRE has been obliged to send a wing of the 78th Highlanders to help the KHAN. It is doubtful whether the aid thus given will suffice—if it is true that the mutineers number thousands—and the next thing General PHAYRE may be obliged to do is to send further troops to save the Highlanders. There has also been a great tribal gathering on the plateau which commands the Khojak Pass, and General PHAYRE was, at the date of the latest advices, preparing to send out a force to disperse the tribesmen. It is impossible, therefore, even to guess the day when he will be in direct communication with General PRIMROSE.

When General ROBERTS reaches Candahar it is much to be hoped that he will find AYOUB KHAN there to oppose him. We hear of AYOUB KHAN having sent to Herat for ammunition, and of his having six thousand men posted in reserve; but the combined forces of General ROBERTS and General PRIMROSE could certainly beat AYOUB KHAN in a fair field, or the basis on which we found our ascendency over natives is gone. But AYOUB KHAN may be too wise to wait to be defeated. He may fall back on Herat, or he may make a push for Cabul. It is not to be concealed that, if he was bold enough to choose the latter course, he might give us infinite trouble. We might have to fight the whole Afghan war over again. A rumour from Cabul if true is more serious than the news from any other quarter. We have gone away from Cabul leaving behind us the works which we had constructed with so much care, and made so formidable, guns, rifles, and ammunition. We, in fact, presented our new friend ABDUL RAHMAN with a fortress of our own making, and with the means of holding it against us or any one else. If we were to trust him, it was thought better to trust him altogether. But there is reason to fear that what has happened so often before has happened again. We trust an Ameer, and then his nominal subjects get hold of all we have given him. They throw him over, and some new chief whom we do not trust gets the spoils. Some troops of ABDUL RAHMAN, says rumour, have mutinied, and General STEWART has been ordered to halt his troops at Jellalabad. There can be little doubt that, if AYOUB KHAN slipped by General ROBERTS, and appeared at Cabul, he would be eagerly welcomed, and that by arrangement or force ABDUL RAHMAN would be set aside. Once more Cabul would have to be taken, and this time it would have to be taken after we ourselves had done our best to make it very difficult to take, and it would be held by a commander who can say that he alone of Afghan leaders has beaten a British force in a fair fight. It would only be with the greatest efforts and after a long delay that we could once more assemble a sufficient force at Cabul; and a new Afghan war might begin which in cost and length might eclipse any Afghan war we have known. If our retirement from Cabul is looked at from a merely military point of view, it is quite true that it was undertaken on the recommendation of military advisers who were not only themselves men of great experience and ability, but who were on the spot, and had exceptional means of forming a right judgment. But while their opinion is entitled to great deference, it may still be described as hard to understand why we did not continue to hold Cabul for the short time that it was expected would elapse before the relief of Candahar and the scattering of AYOUB's forces were accomplished.

THE EASTERN QUESTION.

IT cannot be said that the Eastern question advances rapidly to a solution. The Porte has returned a formal answer to the Collective Note, which required a transfer of territory to Montenegro within three weeks; and it is said that the six Powers have in a rejoinder repeated without qualification their original demands. The principle of the cession of Dulcigno is nominally accepted, and the Turkish Minister is careful to dilate on the greatness of the sacrifice which the SULTAN is nevertheless, in deference to the European Powers, willing to make. On the other hand, the specified limit of time is rejected as impracticable, and the SULTAN positively declines to use force against the Albanians if they hesitate to evacuate the territory. As troops have lately been sent from Constantinople to the Montenegrin frontier, it had been supposed that the Porte had at last resolved to compel submission. If the Albanians find that they have no coercion to apprehend, they will undoubtedly refuse obedience to a mandate which, as they may reasonably conjecture, has not been issued in earnest. In the event of collision with the forces of Montenegro they will, with or without reason, rely on the support of the Turkish force, and they have apparently at present no compulsion to apprehend from the Powers which were lately represented at Berlin. Nothing has been said of late respecting the naval demonstration, which could not in any case greatly alarm the Albanians. The statements which are from day to day published of the intentions of the different Governments are confused and contradictory; but none of the Powers are known to have formally withdrawn from the concert which was lately established. M. DE FREYCINET's vague declaration that France has resumed her place in the Councils of Europe may or may not imply a purpose of sending two or three ironclads to form part of a combined squadron. It is known that the French Government is lukewarm in the negotiation with Turkey, but it has not yet declined co-operation with England. The policy of Austria and Germany is only indicated by the permission given to a few German functionaries and military officers to enter temporarily into the service of the Porte.

If the question of the Montenegrin frontier had been the only subject of negotiation, it is not improbable that the Porte would by this time have thought it expedient to end a troublesome controversy; but it may be worth while to prolong a hopeless contest for the purpose of postponing the decision of a more important issue. Behind the Montenegrin dispute lies the demand of the Berlin Conference for the cession of a large territory, including Janina, to the kingdom of Greece. The SULTAN's advisers understand that the surrender cannot be enforced until negotiations have begun; and, up to the present time, the proposed surrender of Dulcigno to the Montenegrins has stood in the way of the Greek claim to Janina. There is much to encourage the SULTAN in his resistance to the decree of the Berlin Conference. The Greek army is not strong enough to take and retain occupation of the disputed territory, and a combined squadron could at most only prevent the Turks from taking advantage of their maritime superiority to threaten Athens and other Greek ports. The Turkish Ministers have probably ascertained that not one of the Great Powers is prepared to support the Greeks by military action. England has no troops to spare for the purpose, even if the present Ministers were inclined to engage in an unprovoked and unnecessary war. France will not repeat the expedition of fifty years ago; and, if official or semi-official journals may be trusted, Germany has no intention of interfering. Italy inclines to the cause of the Albanians rather than of the Greeks; and there only remains the Russian Govern-

ment, which is more likely to promote the aggrandizement of Bulgaria or of Servia than of Greece. The only rational hope of the Greeks must be founded on the assumption that the Great Powers can scarcely have intended to make themselves ridiculous by preferring a joint demand without any purpose of insisting on compliance. Notwithstanding Mr. GLADSTONE'S complacent belief in the irresistible influence of the concert of Europe, the Porte may as safely defy six Powers as one, if it has nothing to fear but diplomatic remonstrance.

In the midst of uncertainty it is not surprising that there should arise strange rumours, some of them probably unfounded, and many of doubtful interpretation. For some time past periodical statements have been made that some or all of the Albanians had formally renounced their allegiance to the SULTAN. There can be no doubt that most of the tribes affect a qualified independence; but the chiefs can scarcely think themselves strong enough to stand alone; and disobedience which may have been connected with Turkish generals, or with the Porte itself, may be exaggerated into rebellion. Another and stranger report represents the SULTAN as disposed to enter into negotiations for the recognition of East Roumelia as an independent principality. It is even stated that the GOVERNOR-GENERAL, who has displayed systematic contumacy in his relations with the Porte, is, by permission of the SULTAN, to assume the style of ALEKO I., Prince of East Roumelia. The supposed object of the change is to create a rivalry between the Governments of East Roumelia and Bulgaria, though it is not easy to understand the advantage which the SULTAN would derive from a nominal relaxation of an ostensible bond between himself and the autonomous province. The story, if it is not wholly fabulous, probably indicates the existence of some Russian intrigue. The Turkish Government cannot but remember the collapse of the arrangement by which, after the Crimean war, Moldavia and Wallachia were to remain separate principalities. Notwithstanding the efforts of Lord PALMERSTON to maintain the provisions of the Treaty of Paris, the combined influence of Russia and France, supported in England by Mr. GLADSTONE, effected the amalgamation of the provinces, and secured the detachment of the new province of Roumania from the Ottoman Empire. A similar result would probably ensue from the elevation of the Governor of East Roumelia to the rank of a tributary prince. The union of the provinces may probably be effected by other means, unless it is prevented by the jealousy of Austria; but, until the rumour is confirmed, it will not appear probable that the Turkish Government will take steps to accelerate the process. There is perhaps some foundation for the rumour of a projected alliance, offensive and defensive, between Bulgaria and Servia; but the Servian Government will not at present defy Austria and Germany.

The inaction of the late Ministers with respect to the proposed transfer of Turkish territory to Greece will have been explained and excused if their successors fail in spite of their zealous exertions to accomplish the object. It is well known that the recommendations made by the Great Powers that the SULTAN should make the concession was not a part of the text of the Treaty of Berlin. The resolution was adopted in compliment to M. WADDINGTON, who then expressed on behalf of Greece an interest which has since unaccountably subsided. The obligation was in form less binding than the clauses of the treaty; but it was understood that at a convenient opportunity all the Powers were bound to promote the interests of Greece. It was said that the English Government had incurred exceptional liabilities by the pressure which had been placed on the Government of Athens during the Russian war. Soon after his return from Berlin, Lord BEACONSFIELD stated in a public speech that Greece would obtain a larger accession of territory than any other State; but, until lately, nothing has been done to justify the assertion. The great majority of well-informed Englishmen would be glad to witness the emancipation of any Greek province which remains under Turkish rule. The proposed increase of the territory of the kingdom by nearly one-half of its present area would be regarded as advantageous; but it must not be inferred that the country is disposed to incur any considerable sacrifice for the benefit of a foreign population. Lord BEACONSFIELD and his colleagues may have satisfied themselves that the cession could not be accomplished without the aid of force, which neither they nor the country were prepared to employ. If the present Government is equally unable to act, it will find itself in a more awkward position, because the controversy has arrived at a later stage. Lord GRANVILLE has intimated a readiness on the part of his Government to undertake that no further concession shall be required of the SULTAN if he complies with the present demand; but England will not guarantee Turkey against future attempts on the part of Greece to extend the territory of the kingdom. The frontier drawn by the Conference of Berlin might perhaps be thought sufficient on the mainland; but the Greeks will never be satisfied as long as any island in the Archipelago remains in the possession of Turkey. Every attempt on the part of the Greek population of Crete to throw off the dominion of the SULTAN will be encouraged openly or secretly by the Government of Athens, although it is doubtful whether the Greeks of the island would not prefer independence to union with the kingdom. One of many recent rumours is to the effect that the Porte has offered to surrender Crete on condition of a withdrawal of the Greek claim to the annexation of Epirus and Thessaly. If the story has any foundation, it deprives the Porte of its most plausible excuse for resisting the demand of the European Powers. Reluctance to place true believers under the power of a Christian Government is intelligible and even respectable; but the Mahometan population of Crete is larger than that of the disputed district on the mainland. If such an overture has been made, the Greeks act wisely in rejecting it.

THE LESSONS OF THE INDIAN BUDGET.

LORD HARTINGTON'S simple and unpretentious exposition of the Indian finances has done much to bring the subject within the range of ordinary understandings, and has effectually cleared away several disagreeable ambiguities which beset it. He spoke, not as the expert laboriously endeavouring to make his hearers understand the technicalities of a subject strange to them but familiar to himself, but as a plain, business-like man, whose task it has been to master an exceedingly intricate matter, and who places his conclusions before his audience with an admission that he does not, in every instance, himself altogether understand the grounds on which they rest. The somewhat oracular telegrams of the Indian Government, for instance, had left him, he frankly acknowledged, still unable to explain how 5½ millions could have been spent on the war in 1879-80 without any one in India being aware of the fact, or how it was that the addition of that sum to the expenses of the year had the effect of reducing the balance only by little more than a million. "Betterness "public works," the Simla oracle had telegraphed, "ex-"plains part." Lord HARTINGTON gives the explanation, not as altogether satisfactory, but as the only one at present vouchsafed to him by the custodians who guard the inner mysteries of the Indian Exchequer.

But as to those parts of the subject which admitted of being fully understood and clearly explained Lord HARTINGTON'S statement was satisfactorily explicit. In the first place, he has given the death-blow to the idea, which has been hinted at in some quarters rather than distinctly affirmed, that the mistake in the War Estimates was the result of a deep-laid plot of the Indian Government to influence the elections by an unduly favourable announcement as to the state of the finances. With generous warmth, he repudiated the suggestion as at once irreconcilable with the high character of the officials concerned, and absurd, on the face of it, as a manœuvre supposed to have been adopted by reasonable beings. Mr. STANHOPE'S elaborate defence of his own share and that of the Home Government in the matter was an almost superfluous demolition of a view which no one except Mr. FAWCETT had ever seriously maintained; but it is, no doubt, well that chapter and verse should be supplied for the categorical denial of a charge which, though universally discredited by well-informed and thoughtful contemporaneous opinion, might on some future occasion have been dragged from obscurity to add fuel to the passions of a party fight. It is well, too, that it should be on record that Mr. STANHOPE'S view is fully endorsed by the SECRETARY OF STATE.

Equally distinct was Lord HARTINGTON'S explanation of that much-disputed item in Indian accounts, the Productive Public Works. Their increasing productiveness forms, he said, the most satisfactory feature of Indian finance; and he supported this view by the statistics of the present year.

On railways, State and guaranteed, 125½ millions have been spent; on canals about 14 millions, making a grand total of 139½ millions. Of this sum about 99 millions have been advanced on the guarantee system, under which the shareholders receive interest at 5 per cent., and a share of any profits above that rate; the remainder has been borrowed for State railways and is debited in the Indian accounts with interest at 4½ per cent. It is satisfactory to know, on the authority of the SECRETARY of STATE, that the whole of this interest, with the exception of 92,000*l.*, will be earned in the current year, notwithstanding that the whole of the State Railway system is in its infancy and considerable portions of it are still actually unfinished. The results of the 14 millions invested in irrigation are still more favourable, as the canals have earned not only 4½ per cent. on the entire capital, but a surplus of 370,000*l.* net profit to boot. This favourable result is partly owing, as Lord HARTINGTON observed, to the inclusion of a portion of canal earnings, which till 1879-80 had been entered under the heading "Land "Revenue"; but there is no ground for questioning the propriety of the transfer; or that, if the account between land revenue and irrigation were accurately adjusted, a still larger sum would be credited to irrigation. The position of the Productive Public Works accordingly may be summed up by the statement that the 153 millions invested in them have, besides interest partly at 4½ and partly at 5 per cent., earned a net profit of about 300,000*l.* for Government, to say nothing of the incalculable benefits conferred on the people by 10 million acres of irrigated land, and 8,000 miles of railroad.

Another point, which Lord HARTINGTON'S statement has placed beyond the possibility of dispute, is the general soundness of the financial position. During the three years now under review, 1878-79, 1879-80, and 1880-81, the margin of revenue over all expenditure, other than that on Productive Public Works and the Afghan war, was 11,179,000*l.* During these three years the sum of 417,000*l.* has been spent in famine relief, and 8,883,000*l.* have been lost by exchange; so that if these two causes of outlay be, like the war, regarded as abnormal, the surplus of the three years would be 21½ millions. Of this surplus 3½ millions were supplied by the special taxes, imposed in 1877-78 for the purpose of strengthening the financial position against famine and other exceptional expenditure; the rest of the surplus is due to improvements in opium revenue, increased earnings of the Productive Public Works, and the general prosperity of the country. In the face of these results we have some difficulty in following Lord HARTINGTON when he says that the policy under which the improved financial arrangements of 1877-8 were adopted "has not been successful, but has completely "failed." The object of that policy was to establish such a surplus of normal revenue over normal expenditure as would enable the country from time to time to meet, without permanent increase of indebtedness, the abnormal expenses of famine relief and other similar charges. This surplus, it was decided, should be 1½ million for famine insurance, and half a million for other charges; and Sir JOHN STRACHEY'S programme would have been carried out, if during the three years six millions, inclusive of the 417,000*l.* actually spent in famine relief, had been thus provided; but, instead of six millions, the balance-sheet of the three years shows a surplus of 11½ millions over normal expenditure; and the fact that during this period an event so altogether exceptional as the invasion and prolonged occupation of foreign territory has for the time altogether disturbed the ordinary financial arrangements, does not, as it appears to us, in any way affect the soundness of Sir JOHN STRACHEY'S calculations or the wisdom of the scheme. No one ever was sanguine enough to hope that India could either be always preserved from the calamity of war, or be enabled to meet the whole of its war expenditure, however serious, out of current income. It was inevitable that, whenever any large and unusual outlay had to be defrayed, the ordinary surplus should be utilized; and whenever it is so utilized, and thus, so far, obviates the necessity for a loan, it fulfils its function just as completely as though it had been devoted to the reduction of existing debt or allowed to accumulate in the coffers of the State. As it is, 11 out of the 18 millions—the estimated net cost of the war and the frontier railways—will have been met from ordinary revenue; and if, as Lord HARTINGTON intimated, the English Government provides for the 1,900,000*l.* by which the SECRETARY OF STATE'S drawings are to be curtailed, the only addition to the public debt will be the Indian loan of 3,130,000*l.*, a sum less by more than a million than that which will meanwhile have been expended on frontier railways. If this prove to be the case, few wars of equal importance have left so slight an impress on the financial position of the country concerned. It was not, however, with the brighter aspects of Indian finance alone that Lord HARTINGTON had to deal. No one who has studied the recently published "Correspondence" as to the Afghan War Estimates could be surprised at the censure which he pronounced on the system under which so grave an error could occur, and on the individuals whose too ready acquiescence in a welcome result suffered an enormous miscalculation to remain for so many months unchallenged. There cannot, of course, be two opinions as to the necessity of guarding by the most stringent precautions against the recurrence of similar blunders. The reforms which will render such a miscarriage for the future impossible have already been indicated, and nothing remains but to regret that some of the most distinguished of the servants of the State should have been involved in the discredit of so signal a breakdown.

Among collateral topics of the less encouraging order, Lord HARTINGTON dwelt with emphasis on the increase of the Home charges, which have swollen in the course of the last few years to the formidable figure of 17 millions sterling. This sum, as Mr. FAWCETT pointed out, represents, at present rates of exchange, some 204 millions of rupees, or nearly half the net revenue of the Government. Such a payment is of course a serious drain, but it is easy to misappreciate its character, and to exaggerate its ill results. Five millions of the 17 represent the interest paid on 97 millions of guaranteed railway capital; but these 97 millions earn a gross profit of 10¾ millions, more than half of which is paid as wages or profits in the country. Another item of 2½ millions represents the interest on the English debt, some of it incurred for public works, by which the wealth of the community has been enormously increased, some in the wars which the building up of a great Empire has from time to time involved, some in the suppression of the Mutiny which threatened its existence. In like manner the 218,000*l.* spent in the India Office and Home establishments, and the 1⅓ millions spent in civil pensions and furlough allowances, may be regarded as money well spent on valuable services not, on the whole, extravagantly remunerated. It is less easy to defend the 1,976,000*l.* paid for "effective," and the 1,936,000*l.* for "non-effective "military charges," a burden against which Indian financiers have long and loudly protested, hitherto without effect on the obdurate conservatism of the Horse Guards. To this point, as well as to the 1¼ million, which might, according to the Army Commission, be economized by improved military organization in India, the attention of economical reformers might advantageously be directed.

THE EMPLOYERS' LIABILITY BILL.

THE principle of the Employers' Liability Bill has been attacked with great force in a letter to the *Times*, which can scarcely be considered as anonymous. The contention of "C." is that the Government have begun at the wrong end. They have not asked themselves why it is necessary that Parliament should interfere in the question at all, and they have consequently asked it to interfere in a very injudicious way. As the law stands, every workman is assumed to have entered into an implied contract to take the risk of any negligence in a fellow-workman. This implied contract is now repudiated by one of the parties alleged to have made it, and the Government measure proposes to put in its place an express Parliamentary contract which, in "C.'s" opinion, "neither "employers nor employed have ever entered into, which "they probably do not understand, and which in numberless cases will be found in practice to be so irksome to "one, or other, or both of the parties that they will at once "begin to contract themselves out of the Act." If the Bill by which this change is effected should be passed, it will "necessarily lead to much uncertainty, great litigation, "considerable ill feeling, and probably considerable dis-"appointment, and to a mass of new law gradually manu-"factured by judges, or, what is worse, by juries." To meet these objections "C." proposes that the plea of common employment shall be altogether abolished, but

that this abolition shall be coupled with a "declaration "that this enactment is not to interfere with any express "contract on the subject which the employer and "employed may make." This declaration, "C." thinks, would be sufficient to prevent the enacting part of the Act from ever coming into operation. As soon as employers knew that in the absence of any contract to the contrary "common employment" could no longer be pleaded against an action for compensation, they would at once make the contract best suited to each particular employment. "One employer would set up a "system of insurance; another would indicate the par-"ticular servants for whose acts alone he would be answer-"able. Some might exclude particular risks, or make the "liability or freedom from liability enter as an ingredient "into the amount of wages." Upon all these points the employers and the employed are the best judges. They know their own work and their own interests, and they are quite competent to look after them without the help of Parliament.

There is an air of simplicity about this proposal which makes it highly attractive, but it may be doubted whether this simplicity would not be more injurious in its consequences than the complications of the Government Bill. In the first place "C." would make the law in the absence of contract work an obvious injustice. An employer would be held answerable for every injury sustained by his workmen through the negligence of their fellow-workmen. That is to say, he would be held answerable for a great deal that he could not have prevented by any possible exercise of care. Whenever a workman was injured by the act or omission of a fellow-workman the presumption would be that the master was liable. He might be able to show that he knew and could know nothing of the man who had inflicted the injury, that the methods of hiring in use in the trade made it impossible for him to have any such knowledge, and that the sole reason why he and not the author of the injury should be held answerable was that he had the means of making compensation, while the workman had not. None of this reasoning, in the absence of any special contract, would stand him in the least stead. The plea of common employment would have been abolished by Act of Parliament, and employers would consequently be liable for the negligence of every workman in their service. It is quite as impossible to see any justice in this proposal when it is made by "C." as when it is made by Mr. Macdonald. It is true that "C." apparently regards the unfairness of the law as the best security that employers will universally enter into express contracts to make it of no effect. This is certainly a new method of legislation, and one which would admit of being extended to a great number of subjects besides employers' liability. The principle seems to be that whenever it is desirable to stimulate people to look after their own interests, the surest way to go to work is to enact that these interests shall suffer if they are not looked after. From this point of view the injustice of a law becomes its best recommendation; since if it were only a little unfair, the inducement to make contracts to supersede it might not be strong enough. It is certainly desirable that everybody should make a will; but it has not yet been proposed that, in order to increase the number of testators, the estates of intestates shall be forfeited to the Crown. On the principle of "C.'s" proposed Bill, there is no reason why this should not at once be done. It is true that to deprive the family of an intestate of any benefit from his property would seem a very harsh measure; but, as "the result of such "enactment would be" that every man would make the will which would be suitable to his particular circumstances, no harm would follow. But why should the law display this self-sacrificing desire to promote the making of wills? Granted that it is desirable that wills should be made in as many cases as possible, it is also desirable that in the cases where they are not made the law should make what it thinks a fair distribution of the property. In the same way, though it may be desirable that employers and workmen should make express contracts as regards the liability of one towards the other, it is also desirable that, in the absence of such contracts, the law should, as far as lies in its power, do what is just rather than what is unjust. If employers or workmen think proper to qualify the action of the law by express arrangement, that is their affair; but Parliament ought not to neglect its own duty in order to stimulate private persons into doing theirs.

This is not the only objection to "C.'s" plan. His principal argument against the Government Bill is the litigation that it will entail. Constant questions will arise, he thinks, as to the interpretation of the words of the Act, and these questions can only be settled by the creation of a vast amount of judge-made or jury-made law. But what chance is there that the numerous and varying contracts which the abolition of the plea of common employment would necessitate, and would be meant to necessitate, would be less productive of litigation? The law, as "C." would have it, would give the injured workman an immense advantage over his employer. If he could show that the contract between them did not touch his particular case, he would be able to get compensation from his master for any damage he might have sustained by the negligence of a fellow-workman, no matter whether the master could have secured him against such negligence or not. The employer would seek to meet this by a carefully drawn contract. Consequently when the injured workman or his advisers came to calculate the chances of getting compensation out of the employer, they would find that the employer had intended to bar the claim beforehand either by setting up a system of insurance, or by indicating particular servants for whose acts alone he would be liable, or by excluding particular risks, or by paying higher wages in consideration of exemption from liability. Is there no material for litigation here? Would not the workman be disposed to try the question whether the particular contract into which he had entered with his employer did, as a matter of fact, exclude him from the benefit of the Act? As there would be no one form of contract prescribed—the merit of the proposal in "C.'s" eyes being that every employer and workman "would make "the contract which would be suitable to their particular employment"—it would be next to impossible until a legal decision had been obtained to say with any certainty whether this or that contract had been successful in barring the employers' liability as regards a particular injury. The difference between the position of the employer under the Government Bill and under "C.'s" proposed Bill would be very serious. In either case he might have to defend an action in order to show that he had contracted himself out of the Act; but, in the former case he would, in the event of defeat, have a most unjust responsibility cast upon him, whereas in the latter case he would at worst have to put up with the smaller, and, as we maintain, reasonable, responsibility for the acts of those to whom he has delegated authority or superintendence. The description which "C." gives of the alternative measures is a misleading one. He says of his own that it would merely remove legal difficulties and invite parties to make their contracts in the way that best suits them; and of the other, that it makes as it were a Parliamentary contract for the parties, and then drives them by its inaptitude to make stipulations against it. What "C.'s" legislation would really do would be to make the law in the absence of contract so unjust to the employer as to force him by its injustice to make stipulations against it. What the Government Bill proposes to do is to make the law in the absence of contract reasonably fair to both parties, while leaving them free to meet the special circumstances of their relation by special agreements.

We are not concerned to defend all the provisions of the Employers' Liability Bill. All that we contend is that the principle on which it is based is a sound one. To abolish the plea of common employment altogether is to hold the employer answerable for injuries which he could not have prevented, just as much as for injuries which he could have prevented. To abolish the plea of common employment in cases where the injury is due to the negligence of persons who have authority or superintendence entrusted to them, is to hold the employer answerable for injuries which he might have prevented, and for no others. An employer cannot have any opinion about the carefulness or recklessness of an ordinary workman. He has had no opportunity of forming such an opinion. But he must know something about the extent to which one or other of these qualities is possessed by a workman to whom he has entrusted the conduct of particular operations or particular departments. He does not appoint men to places of this kind without satisfying himself as to their willingness to look after his interests, and their ability to look after them intelligently. In future he will have to extend the field of caution, and to be as exacting about evidence of care in dealing with the lives and limbs of fellow-workmen as about similar evidence

with regard to their treatment of his own property. This is not in itself an unduly hard demand to make, though the terms in which it is made by the Bill may here and there be badly chosen. It would have been well if the House of Lords had improved them instead of crippling the definition of superintendence by the omission of one of the two clauses which relate to it. The omission of all mention of insurance from the Bill, though it has been much censured, is really perfectly natural. Insurance, as we have more than once said, has for its object the lightening the burden of unavoidable accidents; the present Bill has for its object the lessening the number of avoidable accidents. Both objects are good in their way, but there is no reason why both should be secured by the same Bill, or that the former should be secured by legislation at all. Employers and workmen are quite competent to determine whether a contribution to an insurance fund is sufficient consideration for exempting a master from the liability to make compensation which the law imposes on him, and nothing would be gained by making Parliament essay to do this for them. It may turn out that some clauses of the Act need amendment when they come to be interpreted by the test of actual working. Nor do we deny that if more time had been given to the preparation of the Bill this inconvenience might have been more conclusively guarded against. But even when full allowance has been made for all blemishes of this kind, the Bill, we are convinced, will be found a substantial improvement on the existing law. The limitation of its operation to two years may be harmless, but it cannot possibly be beneficial.

LORD CHELMSFORD'S DEFENCE.

LORD CHELMSFORD'S defence of his conduct in connexion with the disaster of Isandlana was delivered in answer to censures by Lord STRATHNAIRN which were contained in former notices of motion, and which were not repeated in his speech. Lord STRATHNAIRN scarcely acted fairly in publicly condemning the strategy and tactics of the South African campaign, unless he had been prepared to support the accusation. As Lord CHELMSFORD said, strategy, which properly means the conduct of military movements by a commander-in-chief, could only refer to the general, not to his officers or to military organization. If Lord STRATHNAIRN afterwards thought that his charges had been unjust or exaggerated, he ought to have made some apology or at least to have formally withdrawn the imputation. His condemnation of the changes which Mr. CARDWELL introduced in the organization of the army, and especially of short service, happened to be inapplicable to the 24th Regiment, of which a part was annihilated at Isandlana. The men had served several years in Africa; and their defeat was in no degree attributable to their want of courage or of strength. The Zulus overpowered them by numbers of which they were enabled to take advantage through the mistakes of the officer in command. Lord CHELMSFORD had ordered Colonel PULLEYN, whom he left in command of the camp, to defend it without dividing his force. It appears that there were four rifles to every running yard of frontage, and to a civilian it appears that such a fire ought to have rendered a successful attack impossible. The experiment was not tried because Colonel DURNFORD, who on his arrival became senior officer, either deliberately disobeyed Lord CHELMSFORD's order, or thought it was inapplicable to himself and to the force which he brought with him. He acquiesced in Colonel PULLEYN's refusal to allow a part of the original garrison to accompany him in an advance; but he added the expression of a hope that, if he was pressed, reinforcements would be sent. Colonel DURNFORD, with his mounted troops, then marched five or six miles from the camp, where they encountered an overwhelming Zulu force, before which they retreated. The enemy had, as they found, penetrated to their rear, and destroyed a battery of horse artillery, which seems to have been insufficiently guarded. Colonel DURNFORD then demanded aid from Colonel PULLEYN, who sent a part of the garrison of the camp to support him. Both the troops in the field and the weak remnant of the garrison were crushed, and it was fortunate that Lord CHELMSFORD's column was not also intercepted in its return. For the mismanagement at Isandlana he seems not to have been responsible, unless professional critics may think that more efficient means of obtaining information ought to have been taken. Lord CHELMSFORD's contention that Colonel DURNFORD was bound by the orders given to Colonel PULLEYN, seems to be sound or at least plausible. By the lucky accident of Sir GARNET WOLSELEY's detention on board, Lord CHELMSFORD had the good fortune to redeem the credit of the English army at the decisive battle of Ulundi. During an interval of three or four months the Zulus, after the manner of savages, had proved themselves incapable of improving their victory. The question whether it would have been practicable after the repulse of Isandlana to make an earlier advance into Zululand is no longer interesting. One of the causes of the catastrophe had been the necessity of marching in several columns to diminish the difficulty of obtaining subsistence. It may perhaps have been prudent to delay the subsequent advance until all preparations were fully completed.

As Lord STRATHNAIRN declined to state the grounds of his adverse judgment, Lord CHELMSFORD's statement was not followed by debate, which would indeed have been wholly purposeless. There is, for the most part, little use in discussing past military events, especially in an assembly of civilians. No principle is involved in the more or less skilful combinations of a general in a campaign which has come to an end; and a defeat, whatever may have been its cause or excuse, is not an agreeable subject of controversy. Two serious military disasters happening in two successive years has not often been recorded in English annals. The Zulus and the Afghans have inflicted blows on the national pride which have seldom been suffered at the hands of more formidable enemies. The national spirit is not yet so entirely broken as to submit passively to defeat. Reinforcements were sent to South Africa without stint; and as soon as news of the battle of Kushk-i-Nakhud arrived troops were despatched without delay from India and from England. The exertions which were required in the spring of 1879 caused much anxiety to those who were interested in military administration. It was felt that in a European war the whole organization of the army would have broken down. It was dispiriting to find that the resources of the country were for the moment almost exhausted in a struggle with an enemy who had neither cannon nor rifles. The Afghans, who are better equipped than the Zulus, have obtained a decisive victory in the open field over a small English army. In neither case can the failure be attributed to short service. The 66th, like the 24th, seems to have fought gallantly to the last; but it is not yet known whether the miscarriage was caused by the mistakes of the general in command, or by the erroneous strategy of his immediate superior, or of the Commander-in-Chief.

The Afghan war, which is not yet ended, though it may approach its close, has been thoroughly unsatisfactory, notwithstanding the military successes, which have now for the first time been interrupted. The Zulu war, though it was neither certainly prudent nor morally justifiable, has accomplished all its objects in the destruction of a formidable military Power. Sir BARTLE FRERE professed to discover causes of quarrel with CETEWAYO, which served, not so much to fill despatches, as to provide an ostensible ground for his declaration of war. Some Zulus had pursued fugitive women of their families within the boundaries of Natal; and a surveyor, who was really taking observations for military purposes, had been detained by Zulus for a few hours. Sir BARTLE FRERE's equanimity would scarcely have been disturbed by either transaction, if he had not long before regarded with anxiety the singular institution by which CETEWAYO had converted a tribe into an army. All his able-bodied subjects were enrolled in regiments; it was only after long service that marriage was permitted; and, as later experience showed, the Zulus are among the bravest of the brave. The KING had, since the annexation of the Transvaal, become, not without reason, unfriendly to the English, who now supported the claims of the Boers againt the British. There was thenceforth only one enemy for CETEWAYO to attack; and he had often announced his intention of "washing his "spears" for the purpose of establishing his reputation as a warrior. Sir BARTLE FRERE's reasoning was plausible and perhaps sound; but probable dangers are not in all cases adequate causes of war. In consistency CETEWAYO was forced sooner or later to invade the English possessions; but barbarous potentates are, like civilized kings, entitled to be sometimes inconsistent. It is possible that the Zulu KING might have been long content to treat his army as a costly plaything which he might be unwilling to spoil. In the last century FREDERICK WILLIAM I. of

Prussia was through life nervously anxious for peace, because his formidable army was so perfect in discipline that it might deteriorate with active service. The public opinion of CETEWAYO's subjects would perhaps have approved an invasion of Natal; but Sir BARTLE FRERE had to deal in England with a tribunal more difficult to satisfy, though his policy was and is in the highest degree popular in South Africa. The war with the Zulus was not thought at home to be necessary, though it might perhaps be expedient; and the disaster of Isandlana naturally stimulated the susceptibility which had already been awakened. The late Ministers, who had been accused of warlike propensities in Europe and Asia, warmly resented the new conflict which had been forced upon them by an independent and daring agent. The Opposition, as might be expected, denounced Sir BARTLE FRERE with still greater vehemence; and the final dissipation of a danger which might perhaps be imaginary failed to reconcile English opinion to the war. If evil has been done, it is but fair to recognize the good which has come. The dissolution of CETEWAYO's military system has probably been an unmixed benefit to the Zulus, who are identical in race and civilization with the peaceable inhabitants of Natal. There is every reason to hope that a short war may be followed by a long peace, of which the result will belong to Sir BARTLE FRERE. A Roman Governor would have followed precisely the same course; but modern English morality is more sensitive, and perhaps juster.

THE JEWS IN EUROPE.

EVERY now and then the Jews remind the other inhabitants of Europe of their existence, especially when their few zealous admirers or their many unintelligent enemies raise a passing but audible cry for or against them. The Christian Powers have lately had the treatment of the Jews in Morocco under their consideration, and have endeavoured, with partial success, to mitigate the unpleasant processes to which the Jews are subjected by the Moors. The recognition of Roumania as an independent State was long delayed by the inability of the Government to satisfy the preliminary condition laid down by the Powers that the Jews must be emancipated, and, in the end, the Powers had to accept the singular compromise by which Roumanian Jews had to be naturalized by the distinct vote of the Legislature in every case. In Germany there has been a distinct revival of antagonism to the Jews, and one Professor has lifted himself into a sort of eminence by pointing out to his countrymen how disagreeable and dangerous German Jews are to real Germans. On the other hand, the gifted authoress of *Adam Bede* has revealed to her readers the magnificent schemes for national resurrection, which she describes as animating not only shadowy young gentlemen, but dingy enthusiasts in dingy London courts. She has subsequently inveighed against the truculent ill feeling too often displayed towards Jews, and has asked impartial reasoners whether grateful admiration ought not rather to be the feeling awakened towards a people who made an heroic resistance to the masters of the world, and have been animated for ages by an exceptional intensity of religious ardour. Among the classes who read the works of such a writer there is probably as little prepossession against the Jews as can be found anywhere, and of England generally it may be said that, even if Englishmen are not much attracted by Jews of the lower class, yet it is at least easier for a Jew than for a Roman Catholic to get into Parliament for an English constituency. In Germany the two great grievances urged against the Jews seem to be that the Jews have got hold of far too large a proportion of the press, and that they poke their way into more and better business than Germans can conveniently spare them. We cannot here share the feelings which lead to these complaints. A portion, but only a small portion, of the English press is in the hands of Jews, and if it is sometimes felt rather than said that the Jews do too well in business, the envy or animosity thus provoked is more than shared by Greeks and Germans. In France, too, Jews are acknowledged to be well treated. They receive a grant from the State for the purposes of their religion, they are by law admissible to every office, and the career of M. CRÉMIEUX shows that this eligibility is more than nominal and theoretical. But, although this liberality of treatment, so far as it extends, may be creditable to England and France, yet if we look at Europe generally, it is impossible not to be struck with the fact that the more Jews there are in the country the more violent is the dislike to them. There are only 40,000 Jews in all England, and only 50,000 in France. But in Germany there are 400,000, in German Austria twice as many, in Russia over two millions, and in Roumania there are over 400,000 in a population of five millions. In Turkey no doubt the Jews are better treated than in the adjacent nominally Christian States, but in European Turkey there are probably not 20,000 Jews, and in Syria, which includes the ancient seat of the race, there are only 40,000, or as many as in the distant island of England. It is difficult to suppose that there is not some connexion between the density of the Jewish population and its ill-treatment, if only it can be traced.

Why the Jews were persecuted in old days needs no explanation. They were persecuted because it was thought not only permissible, but a sacred duty, to persecute them. They were supported under persecution, and were enabled to preserve their identity as a people, by the bonds and ties of race, by the isolation attendant on peculiar customs, and by the consciousness that they were the appointed depositaries of the law. Persecution tainted them with the vices which oppression always develops in the oppressed, and which are now flowering after centuries like an aloe in our fellow-Christians of Bulgaria and Roumelia. But persecution never lowered the Jew into an acquiescence in the superiority of the Christian. He gave back scorn for scorn, and the Jew honestly, if secretly, thought the Christian as much of a dog as the Christian thought the Jew. All communities which are below the highest scale of civilization dislike aliens in their midst, aliens of whom they are never rid, and aliens who offend the feelings on which the natives most pride themselves, and which they cherish most fondly. And the Jews were not only aliens who lived in a small circle of their own, but who had the greatest objection to be anything but aliens. The last howl of Jewish indignation in countries where they have been persecuted has always been reserved for those of their own fold who have strayed into something that looked like too close a fellowship with the Christian. A German novelist has lately pourtrayed the miserable career of a Russian Jew, who, having a turn for military life, re-enlisted after his time of service was over, and returned to his home, to be treated as an outcast, because he had served a Christian Government longer than he was obliged to do so. It is not therefore wonderful that the Jews should have been hated as aliens, and should have been all the more hated because they hated their haters. This is the feeling that lies at the bottom of the hostility which Jews have to encounter; and it is to this feeling that those really appeal who denounce the Jew for other reasons. But, at any rate, in the Europe of the present day, the antipathy to Jews is not avowedly that which is prompted by differences of race and religion. German professors are not the kind of people to be led away by an inconsiderate zeal for the Christian religion, and even the Roumanians never said that they could not emancipate the Jews simply because they were Jews. There must be something in the Jewish nation besides their speciality of race and religion, to account for their success where they have had a clear field, and for the hostility which they have awakened where they have not had a clear field before them.

The quality of the Jewish mind that has brought it at once into eminence and antagonism is its expansiveness. No national mind is so rigid in one direction and so elastic in another. The Jew guards his fortress, but is always sallying out from it. He has a passion for affairs, he longs to do something and to be something. In countries where he is treated as an outcast, he has no other outlet for this passion for activity but commerce, and, as he is the worst treated in the backward countries, for commerce of the most petty kind. He has taught himself by the practice of ages to become the prince of hucksters and usurers. As a rule, he is not allowed to hold land and has lost the art of agriculture with which in old days he converted into fruitful terraces the barren rocks of Palestine. He has been shut out from armies, and his exclusion has stunted in him the fertility of military resource, the power of military contention, and the recklessness of life which for a time made him a

match for the legions of TITUS. But where he can find an opening he uses it. If he can do only little business, he does little business. If big business is open to him, he does the biggest business within his reach. Where better things were offered to his grasp he has shown himself a master in philosophy, in poetry, and in art. What is most curious is that, if only he has a chance, he expands into a new nationality without losing his old one. The English and French Jew is a Jew, always remaining in his circle, and yet is an Englishman or a Frenchman. No Frenchmen showed themselves more devotedly French in the German war than the French Jews; and in England our literary Jews show themselves furious patriots and write up the leopards of England as their ancestors might, had they possessed the art, have written up the Lion of Judah. The MASTER of the ROLLS is one of the ablest of judges; but, except in the superiority of his acumen, he is exactly like any other judge. It is not, therefore, wonderful that when they have free play, and yet are not too numerous to excite much comment, they should succeed without awakening jealousy. In a country like Germany, where they are numerous and where commerce is at once backward, so that their success is not swallowed up in the success of the nation, and forward enough to give them considerable chances, they get on, but not without considerable social friction. In countries like Roumania, where civilization is just dawning, and where they form a substantial part of the population, they can only do small things; but they do those with a pertinacity and on a scale which strike a perpetual uneasiness into the rude minds of their wondering and grudging neighbours. In the long run, it may be confidently predicted that everything that favours civilization will favour the Jew.

THE SAVINGS BANK BILL.

EXCISION and amendment are turning the Savings Bank Bill into a very useful measure. As it stood at first, it aimed at making the State the banker of the lower middle class. Any one who found at the end of a year that he was 150*l.* to the good might, if the Bill had passed in its original form, have asked the Post Office to keep it for him. This part of the Bill has disappeared, nominally till next Session, really, it may be hoped, for good and all. When this ambitious dream had been laid to rest, there still remained a large field in which Mr. FAWCETT's energy and his zeal for the real interests of the working class had room to show themselves. It will in future be open to any one who has saved 10*l.* to invest it in Consols, without the intervention of a broker. That this provision is sound in principle there can be no doubt. There has been an unusual consensus of opinion in favour of some such opportunity being given to small investors. It must be admitted, of course, that the plan is an experiment, and there are those who say that, as between the Post Office Savings Bank and Government Stock the poor will have no choice, and consequently that the power of investing their savings in the latter, instead of in the former, will lie unused. If so, the Bill will do no good; but, as even in that case it will do no harm, the experiment is well worth making. It is quite possible that those who argue in this way will prove to have greatly underrated the influence of names upon the imagination. Substantially, no doubt, he who has 150*l.* to his credit in the Post Office Savings Bank is as good a man as he who has the same sum invested in Consols. But the sound of having money in the funds is very much finer than the sound of having money in the Savings Bank. The one phrase has a well-to-do and even wealthy air about it; it makes the man to whom it is applied a capitalist in the eyes of his neighbours. The other suggests an idea of small savings stored up against a rainy day which is sure to come in the end, and may come at any moment. We are inclined to think that the influence of this distinction will be considerable, that the dignity of being an investor as compared with a depositor will have a real attraction for the poor, and that the number of holders of Government stock under the provisions of the new Bill will be quite as large as its authors expect. Nor will these investors be in all cases depositors under another name. If the credit of having money in the Funds is different in kind as well as in degree from the credit of having money in the Savings Bank, some who do not much favour the latter mode of putting by their earnings may be tempted into an unaccustomed frugality. It is conceivable, at all events, that a young man who thinks the Savings Bank rather a poor-spirited affair may take a different view of a real investment, and that the purchase of Consols may become a fashion with some who have not yet been touched by the desire of accumulation. It is a question, of course, whether this class will not be discouraged by the restriction of investments to amounts of 10*l.* and upwards. The Government plead that, as they are admittedly trying an experiment, they ought not to be urged to proceed too quickly. In itself, no doubt, this is a very reasonable plea, but its force depends on the extent to which the limit fixed will allow the experiment to be fairly tried. If there will be half as many investors at 10*l.* as there would be at 5*l.*, it is very well to begin with 10*l.*, and afterwards to lower it to 5*l.* But supposing that there are but a fractional part of the investors at 10*l.* that there would be at 5*l.*, it is plain that only a very inadequate idea of the ultimate success of the experiment can be derived from this first trial. This objection is not met by Mr. FAWCETT's promise to lower the limit hereafter if there is found to be any considerable disposition to invest money in this way. There may be a considerable disposition to invest sums under 10*l.* combined with very little disposition, because very little ability, to invest sums over 10*l.* It is not probable that the experiment will fail altogether, even if the larger amount is retained in the Bill, because the depositors in the Post Office Savings Banks will of themselves furnish a considerable number of would-be investors. But the class we have just referred to—the class which despises the Savings Bank, but may be tempted by the funds—will hardly be reached unless the limit is reduced. What is wanted to strike the imagination of the younger workmen is a power of investing a sum which may be earned in a single industrious week, and until this is done, the full success of which the experiment is capable will not be known. We cannot see much force in the argument that, if there should be a sudden fall in Consols, the hurry of small holders to sell might lead to a panic. It is very doubtful whether the poor will ever trouble themselves much about the current value of their stock, unless indeed they are forced to sell at a bad time. Except in individual cases, they will be satisfied so long as their interest is regularly paid them, and may even be tempted to practise extraordinary economy in order to be able to buy on the advantageous terms which can be obtained when buyers are few and sellers many. The imagination of many people a good way removed from poverty refuses to contemplate a state of things in which the credit of the English Government will be seriously shaken.

Two other experiments were announced on Wednesday by Mr. FAWCETT. One of these aims at bringing the Post Office Savings Banks nearer the homes of the class from which the depositors are chiefly drawn. Although new banks are constantly being opened, there are still many districts at which they stand at considerable distances apart. Mr. FAWCETT has picked out thirty places at which there are at present no Post Office Savings Bank, and has arranged for a clerk to attend weekly to transact Savings Bank business. During the month the scheme has been in operation, 145 deposits have been made, amounting in all to 290*l.* Something may have to be deducted for deposits which would have been taken to a more distant post office if the visit of the clerk had not been made. But, considering the trouble incurred by the transfer of an account, it is probable that the greater part of this money might never have found its way into a Savings Bank at all if the Savings Bank had not first found its way to the money. In that case, the thirty clerks employed at an average expense of 6*s.* 8*d.* each visit have done a real service to the depositors. Mr. FAWCETT promises that, if these travelling Savings Banks answer as well in the future as they have done in the past, they will be continued and extended; and it may be hoped that in no very long time no village will be without the means of depositing its savings, at all events at frequent intervals.

Mr. FAWCETT's other expedient is still more ingenious. He is anxious, for one thing, to touch the class of persons that has hitherto been reached only by such private Savings Banks as accept penny deposits. The class is probably a considerable one, if all the children who are encouraged to save in this way are reckoned; and if we

further include all persons who are unable at any time to deposit the shilling, which is the lowest sum that can be received at a post office, it becomes very large indeed. It is impossible to turn the post offices into penny banks, on the ground of expense; and this might be a serious drawback even to the reduction of the minimum deposit to sixpence. An official of the Post Office has suggested that forms should be issued containing twelve spaces, each the size of a penny stamp, and that, when any one of these forms with twelve clean stamps stuck on it is presented at a Post Office Savings Bank, it will be treated as a deposit of a shilling. At present this plan is to be tried only in certain selected counties in the three kingdoms; but, if people show that they value the opportunity thus afforded to them of saving the smallest possible sums, it will be extended to the whole country. The obvious hindrances to the success of the plan are the difficulty of keeping the stamps sufficiently clean to make it clear to the postmaster that they have never been used, and the danger that some of the stamps may be lost before the whole dozen has been collected. If, however, an effective wish to save really exists among people so poor as to be able to put by only a penny or two at a time, it will probably be strong enough to get over these obstacles. A considerable proportion of the depositors under this new arrangement will probably be children, and for them much may be done in the way of providing them with stamps, and keeping their forms for them. It might be a part of the ordinary machinery of every elementary school to keep stamps on sale for the purpose of affixing to the children's forms.

Mr. FAWCETT deserves great credit for introducing these experiments. Thrift is a plant of slow growth in English bosoms, and it is only by resorting to every imaginable expedient that seems to have any promise in it that those which really promote frugality can be discovered. It is to be said in behalf of Mr. FAWCETT's schemes that hitherto every change which has made saving really easier has led to more money being saved. The English poor do not seem to take with any heartiness to the principle of insurance, but they do take heartily to the principle of putting by money with the power, in case of need, of getting it again. They do not trouble much about what happens after their funeral, and they are willing to trust their old age to chance or the Poor-law, except so far as they may have money laid by with which to support themselves. But they do value a Savings Bank, and in all probability it will be found that they will also value the funds. It is only fitting that the work of extending the facilities for putting by savings should have fallen to Mr. FAWCETT. No man has preached more steadily than he the importance of distinguishing between good and bad State help, between the help that only demoralizes the receiver by making him less inclined to do anything for himself and the help which makes his efforts on his own behalf more effectual than they otherwise could be. When Mr. FAWCETT has done his best to make saving popular, he may be able to devise some better way than has yet been discovered of popularizing insurance. In matters of this kind a good deal turns on the form in which a scheme is presented to the public; and certainly, as yet, the Insurance Tables of the Post Office have not hit the poor on the right spot. Whether, by devising some new combination, either of payments or benefits, it would be possible to remedy this, can only be discovered by experiment. The fault of the Post Office hitherto is that it has not been sufficiently enterprising in this direction. Its attitude towards insurers has been one of entire indifference, the indifference of a Government department. If something of the temper of an Insurance Office which has its way to make in the world could be infused into it, some better result might perhaps be arrived at. If it is worth the while of the Government to invite insurers at all, it must be worth its while to secure them as well as to bid for them.

WELLINGTON COLLEGE.

THE Report of the Royal Commission appointed to inquire into the foundation, development, and present condition of Wellington College will not give entire satisfaction. As regards the question in which the complainants take most interest the decision of the Commissioners is distinctly adverse. It will be remembered that the officers who found fault with the system on which the College is now administered did so on two grounds. In the first place, they said that the number of foundationers had not been increased, as the public had been told it would be. In the next place, they said that a class of boys whom the College was originally intended to benefit is not benefited at all. The gist of the charge against the administration lies in this second plea. The College was founded to provide the children of deceased officers with a gratuitous, or nearly gratuitous, education; but, before it was opened, the Governors determined to give education at cost price to a certain number of children of living officers. A great many officers complain that this promise has been kept in the letter, but broken in the spirit. It is true that between seventy and eighty children of living officers are now receiving their education at Wellington, on terms which involve a slight yearly loss to the College. But the sum which their parents have to pay for this education is 80*l.* a year; and it is contended, with great truth, that this is a much larger sum than many officers are able to provide. A man who can spend this much on the education of a single son has many schools open to him, and there is no particular reason why a new College should have been established in order to give him what he could get equally well elsewhere. The Governors reply that, as a matter of fact, he could not get anything quite as good elsewhere, though he might get something nearly as good. Wellington, they say, stands in the first rank of public schools, and a payment of 80*l.* a year will, at most, gain an entrance into public schools of the second rank. Further, they say that, though a certain kind of education might be given for a smaller sum, it is not such an education as the real founders of Wellington, the public which subscribed the larger part of the endowment, would like to see given to the foundationers. The primary object of the College is to give the orphan children of officers an education of the highest class, and the cost price of such an education cannot be reduced below 80*l.* a year. Consequently, if the interests of children of living officers were considered, the interests of the children of deceased officers would suffer. It would be no longer possible for an officer's orphan child to obtain without payment an education equal to any he could obtain at a public school. Since, therefore, the foundationers must be the primary object of the Governors' care, it is imposible for them to make the cost of education at Wellington less than it is. The complainants met this by a denial that the interests of the foundationers are really served by the plan which the Governors have adopted. It would have been better, they said, if boys who had their own way to make in the world had been brought up in a plainer fashion. They will have to rough it by and by—why should not they begin by roughing it a little at school? Upon the issue thus joined between the complainants and the Governors, the Commissioners pronounce in favour of the Governors. They admit that the number of orphan sons of officers educated at Wellington "has not increased as it was intended it should increase." But against this must be set the fact that the orphans who are being educated there are receiving a very much better education than it was intended they should receive. Fewer members of the class it was proposed to benefit have gained by the existence of the College, but those who have gained have gained a good deal more. The Governors have permitted Wellington "to develop from "an exclusive orphanage conferring a cheap and necessarily inferior education into a large public school . . . "holding out to the objects of the charity social and "educational advantages worthy alike of the name it bears "and of the officers for whom it was designed." In making this choice the Commissioners do not hesitate to say that the Governors have acted wisely and in the best interests of the army.

The public will probably agree with the Commissioners, and it will do so on two grounds. It is not likely that any one with fewer opportunities of investigating the facts of the case will arrive at a sounder opinion than has been arrived at by Lord PENZANCE, General RUSSELL, the Bishop of EXETER, Lord SHERBROOKE, and Colonel CHESNEY, after a full examination of those facts. That is one reason. The other is that the issue is not correctly represented when it is represented as lying between plain living and luxurious living, between roughing it and not roughing it. The difference between Eton or Harrow and a good middle-class school does not merely lie in the food on

the table or the furniture in the rooms. It lies quite as much in the attainments of the masters. Human razors do not like to be set to cut human blocks, and a man who has taken high honours at Oxford or Cambridge does not care to become a master in a school where scholarship will be little cared for, and little opportunity be given for displaying it. On the assumption that the children of deceased officers who are brought up at Wellington ought to get the best education that can be had, the change which the College has undergone was a necessary change, and few people will be disposed to differ from the Commissioners in their opinion that this assumption was the right one for the Governors to go on. If sufficient subscribers can be found, a college may be established for giving the children of living officers an education of which the cost price shall be 30*l.* a year—the sum it was originally proposed to charge children of living officers at Wellington. But such an education would not answer to the ideal which the public interested in the matter have formed to themselves of the education which they wish the children of deceased officers to receive, and consequently it is not in the power of the Governors of Wellington to provide it in the College without injury to the foundationers.

When the Commissioners had come to this conclusion it only remained to suggest such detailed reforms in the administration of the College as had occurred to them in the course of their inquiries. The reason why the number of boys on the foundation has not been increased being the want of funds, it is an indispensable condition of any extension in this direction, either that the income of the College should be increased, or that its expenditure should be reduced. The Commissioners are of opinion that the income of the College has been needlessly lowered by the remission of the payments originally made by each foundationer. They point out that in comparatively few instances are the relations of the boys able to pay nothing whatever towards the cost of their education, and that these exceptional cases might be specially considered by the Governors. If every foundationer not specially exempted were to pay 25*l.* a year, the addition thus made to the College income would allow of the admission of twenty-three more foundationers at the same average charge. The Commissioners further remark that the payment made to the house-master by the boys in the boarding-houses is very much in excess of what is usual in public schools. Each boy pays altogether 130*l.* yearly, of which 40*l.* goes to the College and 90*l.* to the house-master. At Rugby the payment to the house-master is only 72*l.*, and even at Winchester it is only 78*l.* 10*s.* The Commissioners rightly think that a payment somewhat in excess of the average rate at other public schools ought to content the Wellington masters, and they recommend that it should be fixed at 75*l.* By this means sixteen more boys paying 25*l.* a year might be admitted to the foundation. The two changes taken together would increase the number of foundationers from eighty to one hundred and nineteen. These are the only means by which, in the opinion of the Commissioners, it would be possible to increase the College income. As regards decrease of expenditure, the Commissioners remark that, if a boy can be boarded and educated at Haileybury for something over 67*l.*, it ought not to take 13*l.* a year more to board and educate a boy at Wellington. "There "is no evidence to show that there is any such difference "in the educational advantages offered by the two "schools, or in the degree of comfort provided for the "boys, as would serve to account for the great difference "of expense." Wellington ought to be conspicuous for frugality and economy, and there can be no reason why it should suffer itself to be outdone in this respect by a school educating about the same number of boys and having been at work for nearly the same time. The first recommendation of the Commissioners is that a Bursar shall be appointed, who shall give his whole time to the management of the accounts and the supervision of the expenditure, instead of these duties being committed, as at present, to one of the assistant-masters. They next suggest that at the next vacancy the salary of the head-master shall be reduced. At present he receives in all more than 2,400*l.* a year, besides a house; and, as no part of this income is derived from the profits of a boarding-house, he is more free from trouble and worry than most head-masters. The income of head-masters is a subject into which no prudent outsider would care to enter unadvisedly. The Commissioners were forced to speak of it in the discharge of their duties; but those who are not under the same obligation will prefer to say nothing. It will be well to observe a similar caution with regard to another suggestion of the Commissioners. "We think," they say, "the masters ought to aim in their training of "the scholars at inculcating by precept and example a "strict simplicity of life." Nothing but the fact that most masters of public schools are at this moment abroad could account for their silence on this head during the week which has passed since the Report was published. Towards the end of next month we shall look to see the columns of the *Times* filled for days together with demonstrations that the masters of public schools are already examples of simplicity, or that they are not, and in the interests of education ought not to be, examples of anything of the sort; or that it is not the business of Royal Commissions to inquire whether they are or are not. Even while making these suggestions the Commissioners feel how impossible it is to introduce reduction of expenditure from the outside. All that can really be done in this way is to suggest the appointment of a small Executive Committee from among the Governors to examine into the actual working of the College, and to determine where economies can be effected. If the evidence of the Medical Officer of the College is to go for anything, there are several items in which the present outlay may be reduced with no injury, it may even be with positive advantage, to the health of the boys. The provision of meat, for example, is so ample that the Medical Officer says that he is constantly obliged in the discharge of his duties to urge a boy not to eat it. The beer also, in the opinion of the same authority, is needlessly strong, and the allowance of it, in the case of the smaller boys, needlessly plentiful. A Royal Commission cannot make recommendations upon matters like these, but an Executive Committee might do so with advantage to the finances of the College. That the army should have been disappointed in the benefits it hoped to obtain from Wellington was perhaps unavoidable and is certainly irremediable; but this circumstance makes it all the more incumbent on the Governors, and on all concerned in the administration of the College, to do everything in their power to restrain needless outlay whether for or by the boys.

THE BRITISH ASSOCIATION AT SWANSEA.

IN choosing what the Mayor of Swansea calls, with perhaps pardonable assumption, the metropolis of Wales for its place of meeting in the year 1880, the British Association may be thought to have paid at once an ingenious compliment to the applied sciences and a delicate attention to those scientific Britons to whom excursions are of more interest than sections. A score of ruined or vegetating cities in the Principality may justly dispute the very dubious title of metropolis, in conferring which upon his own town the Mayor probably meant that Swansea is the largest and most important, not the most ancient or historically distinguished, of Cambrian municipalities. But no Welsh town, save perhaps Merthyr Tydvil, can contest with the head-quarters of tin and copper working the palm of hideousness. Hence Swansea is an admirable place to leave. The authorities have had only the embarrassment of choice in arranging excursions. The Mumbles, the curious and storied peninsula of Gower, are close at hand; half the beauties of South Wales are almost as close; and to anybody for whom the very brown and singularly unquiet waters of the Bristol Channel have no terrors, Ilfracombe and its neighbourhood supply a pleasing opportunity of making or renewing acquaintance with them. The *livret* of excursions on the present occasion is quite a formidable volume.

To the outside world which has not the opportunity or perhaps the desire to stow itself into waggonettes and omnibuses, and to be personally conducted to all sorts of sights, the principal event of a British Association meeting is naturally the Presidential address. The time-honoured habit of giving in these compositions an outline of the chief scientific work of the year has had a certain distinct and definite use in recalling to persons who are not scientific specialists the progress of things in this particular direction. Presidents, moreover, have generally endeavoured to put something of their own into the mixture, and a Presidential address for the most part leaves some conversational or anecdotic reminiscence behind it. Professor Tyndall's Belfast harangue, half-a-dozen years since, certainly satisfied Bentley's severe requirement of being quotable, and a year or two ago the public was mildly agitated by Mr. Spottiswoode's description of the state of things in which no mortal would be able to tie his cravat. Professor Ramsay, the President of 1880, has scorned these frivolities. He has not talked about science in general, nor has he condescended to a *compte rendu* of the results of the year. Professor Ramsay's address was simply an elaborate dissertation of a generalizing character on his own special subject, geology. A certain amount

of disappointment may have been felt by some hearers; but perhaps there have been worse kinds of Presidential addresses. A discourse of the wider and more philosophical sort by a distinguished specialist has, at any rate for a time, a more abiding value than a mere review of the performances of the year. The departments of science represented by the successive Presidents are sufficiently varied; and it is not likely that the same department will get itself represented much oftener than once in a decade. If all Presidents followed Professor Ramsay's example, their work might be for the moment less piquant and interesting, but a collection of it would go far to supply a bird's-eye view of the state of each science at convenient intervals. Next year, which is the fiftieth of the Association, it cannot be doubted that the President will be chosen mainly for his power of coruscating, and then those who crave for coruscations will doubtless be satisfied.

There was little in Professor Ramsay's address that could justly be called startling by anybody acquainted with the history of geological speculation. It might, on the whole, be said to be rather a summing-up of the general tendency of the studies of the last hundred and fifty years than anything else. Implicit acceptance is not the habit of scientific persons; and there are, no doubt, plenty of points in the address which will be vigorously criticized. The recurrence of glacial epochs in particular is one of those points on which the doctors delight to differ. But, on the whole, each successive school of geologists has been more and more inclined to give up the theory of cataclysms and conflagrations, of upheavals and engulfings, in favour of the doctrine of slow and steady changes, not differing in any marked manner from the changes which are at present going on over the actual globe. It was quite natural that it should take some time before this conception was generally realized. While the actual observing work of geology was in the highest degree incomplete—or rather, as it can hardly be said to be other than incomplete now, while it was merely beginning—it was natural that each man should seek for a probable and convenient explanation of the particular phenomena which he was himself investigating. A cataclysm or a conflagration came handy to explain the appearance of this or that adjustment of strata, and a cataclysm or a conflagration was promptly supposed. But when men who inherited the labours of these early explorers found themselves charged with the task of harmonizing the cataclysms and the conflagrations with themselves and with newly-observed facts, it was equally natural that these provisional and tentative hypotheses should be abandoned. They have not quite gone yet; but Professor Ramsay's address may be said to be in all probability the herald of their going. It is to be observed that the Professor was very chary of launching out into theories of creation of any kind, and very much disposed to take the world as he found it. The nebular theory, with its hypothesis of a globe cooling down and hardening in the process—a theory not unlike that irreverently put long ago by Barham, namely, that the earth is over-baked about the Isle of Purbeck and slack-baked about the Bog of Allen—seemed to him probable; but he would say nothing more. Astronomers must talk of that; he was a geologist. This is perhaps a more parochial view of things than the world has been accustomed to in Presidents of the British Association, but it decidedly has its merits. So long as a man sticks to what he knows he is little likely to indulge in the wide and wild generalizations which are the delight of learned ladies and sometimes the scandal of not very wise men. It must be mentioned, too, to the credit of Professor Ramsay's address, that it steered entirely clear of theological difficulties. The old days of perpetual gold-and-silver-shield discussions, in which the disputants habitually argued wide of each other's elenchus, can hardly, we fear, be said to have disappeared altogether. But there is little excuse for any revival of them in connexion with Professor Ramsay's speech. The speech, moreover, in its illustrative parts, abounded with useful matter for comparatively unlearned and ignorant folk. That part of it which dealt with the question of rocksalt may be taken as an instance. There are few more dismal regions of the world than those, such as the Atacama of South America, the salt deserts of the Rocky Mountains, and the great central tableland of Asia, where the salt simply lies strewn about the surface of the ground or fills in a highly concentrated solution the useless and unfertilizing reservoirs of huge lakes. Yet, if Professor Ramsay's theories are correct, this sterile desolation is only a link in the chain of changes which leads to the formation of the deposits which enrich Cheshire and Galicia and the Punjaub. The Atacama is simply Droitwich and Wieliczka *in posse*, the great salt lakes of Asia are simply the same in a stage still further removed. First dissolved and then precipitated by evaporation, the salt slowly gathers until it ceases to strew the surface, a useless and sterilizing encumbrance, and instead underlies the ground in solid masses supporting a fertile soil, and ready when the miner's pick comes to seek it to contribute to the necessities of the world. There certainly needs no laborious process of harmonizing to assimilate hypotheses like these to the requirements of any religion, and it would be difficult for the Laureate's clergyman who hawked at geology and schism to find quarry here.

Every meeting of the British Association brings up again the old question of the utility of such gatherings to science, truly so called. When this Association was founded, people in general had by no means given up the old notion of the *virtuoso*, the fantastic, if harmless, lunatic who pottered about frogs, and butterflies, and weeds, and bits of stone, and who of course was much more amusing in his gregarious than in his solitary condition. A good many things have happened since that time, and the *virtuoso* has become something of a power in the land. He always had the great faculty of believing in himself, a faculty which, strange as it may seem to those who have heard of the vanity of authors, has generally failed his chief rival, the man of letters. Perhaps the insensibility of many scientific men to the humorous side of their own pursuits was the cause of the laugh being so long kept up against them. But, however that may be, the British Association has long been a sober fact to others besides its members, and it has, or will soon have, the characteristic which charms M. Challemel-Lacour in so many of our institutions. It is positively becoming ancient. It has lasted out changes in the map of Europe which would take a stout atlas to record them. It has seen something like a dozen French Constitutions, and very few indeed of those who took part in its first meeting are likely to be present next year at its fiftieth. In the course of the interval, it has done—it is only fair to remember it—not a little solid work to which no other of the congresses which are in some sort its rivals can lay claim. The few hundreds a year which the British Association dispenses in grants form the only sum, strictly speaking, in the whole enormous educational budget, public and private, of England, which is definitely allotted to the much-wrangled-over endowment of research. The grantees, in not a few instances, really have "researched," with benefit to themselves and to the world. Secondly, in the papers, from Professor Ramsay's address downwards, which have been read this week and will be read next week, though there is doubtless a good deal of rubbish, there is a good deal more which cannot fairly be called by that opprobrious title. The British Association performs in England, and in a very English way, something of the same function performed in France by the various scientific Academies. The preparation of a paper is rarely altogether waste of time; and the discussion of it, when it gets itself discussed, is not wholly lost labour. For undoubtedly the worse tendency of scientific study, with its immense subdivision and the absence of the checks and safeguards which exist in literature, is its tendency to a kind of provincial pottering about matters which are in reality unimportant and uninteresting to any rational mind. Contact with others is the best remedy for this; and the scientific crotcheteer who gets a paper discussed is undergoing much the same beneficent discipline as that which a home-bred prodigy undergoes in his first day or two at a public school. Of course it would be idle to deny that to the student of human nature the survival of oddities at gatherings such as these is a matter of still more interest than their rubbing down and disappearance. The British Association falls somewhat short of its compeer, the Social Science Congress, in the provision of this sort of game, and the crotchets which are brought forward at its meetings are for the most part of a more recondite and less easily enjoyed character. But still there is plenty for the observer. When next year comes, and its President takes occasion, as no doubt he will do, to compare the present position of science in England with its position in the first year of William IV., he will probably have the good sense not to claim all the progress as being due to the agency of the Association. But, if his modesty led him to claim nothing at all, he would make a mistake. The Association has done some good work of a definite kind, and more of a kind that is indefinite, so that on the whole scientific and non-scientific persons may pardon it its excursions, its occasional tall talk, and its occasional suspicion of playing at working.

INJURED INNOCENCE.

It is all very well for moralists to implore their disciples not to let the habit of regarding the ludicrous aspects of things acquire too strong a hold on them. But any moralist who for some time to come makes an appeal of this kind may with great advantage be referred to the debate which took place in the House of Commons on Monday night on the subject of Mr. Dillon's character. It might have been thought that the character of the member for Tipperary hardly required several hours' talking in presence of the Speaker of the House of Commons to settle it, seeing that the honourable gentleman had with great frankness expounded it to everybody some days before. Mr. Forster, however, had been imprudent enough to give vent to the opinions entertained by most people on the subject, and Mr. Dillon was deeply hurt. It was, of course, of not the slightest importance to him personally what a minion of tyranny might think of him; but, as Mr. Forster's words seemed to reflect on the Irish nation, Mr. Dillon thought it right to protest. So he did protest, in a manner which we can assure him must have cleared up any lingering doubts as to that knotty problem—his character—which may have remained after Mr. Forster's comments. Him followed many of his friends, for some of whom we are rather sorry to be able to find no better description. A very few such Irish members as Mr. Mitchell Henry cleared themselves honestly and like men from any complicity with Mr. Dillon's amiable designs. Others, like Mr. Justin McCarthy, justified only too sadly the dictum of the ancients about the effect of evil communications upon good manners. But most of them—the Sextons, and the Finigans, and the Sullivans, and the Parnells, and the O'Connors—acted after their kind. They were desperately injured, ostentatiously innocent, studious to say nothing that could commit themselves, while at the same time they said "ditto" to Mr. Dillon with the same exquisite humanity, the same courageous

straightforwardness, the same delicate appreciation of the duty of man to the lower animals (including landlords), which had characterized the now famous address of the member for mild-minded Tipperary. Mr. Justin McCarthy was so encouraged by this display that, according to one report of his speech, he ventured on a syllogism, always a dangerous thing for an Irishman to attempt. "When men of honour and intelligence," said in effect Mr. McCarthy, "came down to the House and backed up Mr. Dillon, it was evidently absurd to make a fuss about his speech." We may point out a certain awkward weakness about Mr. McCarthy's major. But, to come back to our moralist, it is evident that, from his earnest point of view, such a display as that on Monday night would be simply horrible and incredible. He would never get over this little difficulty of Mr. McCarthy's, and the spectacle of men of honour and intelligence approving instigations to revolt, robbery, and the most dastardly cruelty—for so his weak mind would probably take it—would be altogether too much for him. A heart "fracted and corroborate," a brain alternately bemused and whirling, would probably be the portion of this unlucky and too matter-of-fact philosopher. When he heard persons in coats and hats, and with not the least external appearance of war-paint, feathers, filed teeth, or suchlike outward and visible signs of savagery, say, *totidem verbis*, that "they could not understand the sympathy of honourable members with the sufferings of cattle"; when he heard other persons, whose blood is the blood of English gentlemen and whose forefathers have associated for generations with those who hold the English gentleman's standard of truth, say that they were "surprised to hear" of practices notorious and common as eating and drinking; when, we say, these facts came before him, the results could not but be disastrous. At best he would probably testify and denounce in a fashion very amusing to the delinquents. Such denunciation would be nearly as idle as stamping and raving and such more demonstrative forms of excitement. It cannot be supposed (we do not imagine that Mr. Forster himself supposed it, though apparently Mr. Mitchell Henry did) that the men who are cowardly and wicked enough to do these things would have honour enough or conscience enough to feel their condemnation. The only really appropriate way of treating them, short of methods which Englishmen have wisely, or unwisely, thought fit to abandon, is to put them to the uses of science. It is really interesting to see how far men will go when they have put off all shame, and are indifferent to the opinion of all their fellows except those who are as shameless as, and more ignorant than, themselves. For such a study the student is never likely to have a more favourable opportunity than he had on Monday night.

The member for Tipperary began well. Strong in the conviction that Mr. Forster would not prosecute him, he was good enough to confess at once the accuracy, save as to words, of the reports of his famous exhortation to the people of Ireland to make use of their hands for picking and stealing, and to protect themselves from the danger of coveting their neighbour's ox or his ass by the precaution of making those cattle valueless. And then Mr. Dillon made that famous distinction between cowardice and wickedness to which we have already referred. Coward he might be, and impostor he might be, but why wicked? For it seems that, though it is no insult to the people of Ireland to suggest that they tolerate and cheer a cowardly impostor, it is a slight on their unblemished morality to insinuate that they approve of "wickedness." This delicate casuistry was ably seconded by Mr. A. O'Connor, who pointed out that it could not be a moral duty to obey English laws because they were "stupid," which in some respects they undoubtedly are. Then, when Mr. Forster had stood to his guns and had in the most insufferably morbid and puling manner mentioned to the House a few cases of brutality to harmless animals (which cases probably made most of the morbid and puling Englishmen, who heard or read them, itch to be within reach of the perpetrators with a good hunting crop), there arose Mr. A. M. Sullivan. Mr. Sullivan is an eloquent speaker and has generally managed to retain the respect of his bitterest political opponents. This apparently troubles him, and he made a noble effort to get rid of the encumbrance by accusing Mr. Forster of "begging the question" in quoting the very atrocities the commission of which Mr. Dillon had in unmistakable language invited. Mr. Sullivan then began to talk about people who were shot down, and his hearers must have been relieved at the prospect of some allusion to the case of Mr. Boyd. But Mr. Sullivan does not seem to have heard of Mr. Boyd, and the shot-down people remain nameless unless they are synonymous with certain malefactors and rioters. If they are the latter, we must own that Mr. Sullivan is quite right, and that sympathy with such persons in England is terribly slack. After Mr. Sullivan came Mr. Mitchell Henry, and Mr. Mitchell Henry does not deserve the application of the anatomic method. For though he denounced Mr. Forster's use of the word cowardice, he made himself extremely unpleasant to Mr. Dillon by demonstrating in the clearest way that his speech was cowardly, wicked, and everything else which Mr. Forster had called it. He went further and analysed the speech itself in a manner which must have made his Irish colleagues not a little uncomfortable. This gave The O'Donoghue a fine opportunity of showing his sincerity in the cause, and he informed the House that he thought nothing of the atrocity of hamstringing cattle as compared with the atrocity of evicting tenants. Mr. Finigan followed after an interlude by Sir P. O'Brien. Mr. Finigan gave the debate a new and pleasing turn. He was the urbane interpreter who would make clear to a House of stupid Saxons the real meaning of Mr. Dillon's words. That honourable gentleman was only in the vivid and forcible manner of his race exhorting Irishmen to "organize," as Mr. Gladstone had exhorted the men of Midlothian. It is to be hoped that the calves with their eyes gouged out, the cattle hamstrung so that they cannot stand, and the sheep docked of their ears appreciate the beauties of Mr. Finigan's method of organization. Mr. Finigan's urbanity, however, served as an excuse for Mr. O'Donnell to discourse on the state of Ireland in general, whereat Lord Hartington mildly protested; but the real genuine thing reappeared in the speech of Dr. Commins, the great Liberal champion of Liverpool, who did his best the other day for Lord Dalhousie. Dr. Commins was quite disgusted at the "maudlin sentimentality" which objected to houghing, though it is surprising to observe that even Dr. Commins does not wholly approve of the practice. This we cannot but think a weakness on his part. Of Messrs. Barry and Byrne, of Gyas and Cloanthus, we shall not speak. But it is worth noting that Mr. Biggar is of the honest few who plainly avowed their opinion that to ask a man to pay you what he has covenanted to pay is a crime far blacker than to inflict cruel tortures on your neighbour's cattle. With Mr. Justin McCarthy we have dealt. Like Mr. McCarthy, Mr. O'Shaughnessy, too, is not exactly the sort of person from whom one would expect to hear the doctrine that "a neighbourhood has a right to do all it can" to prevent farms empty by eviction from being taken, even though the statement be qualified by a proviso about violence. But here, as elsewhere, bad company and the contagion of political excitement will apparently do wonders. Then came Mr. Parnell's ingenuous surprise at the idea of cruelty having been shown towards cattle, and Mr. Dillon's sturdy wonder at the fuss made about that cruelty. So the innocents demonstrated their innocence triumphantly, and no doubt seemed to themselves as white as, shall we say the lambs whose mammas Mr. Dillon's friends deprive of their ears, or the milk of the cows whom the same heroes humorously vivisect?

One point not hitherto much noticed deserves a little attention. Everybody was very indignant at the charge of cowardice brought against Mr. Dillon, against "John" Dillon, as Mr. Sullivan remarked with eloquent pathos. Everybody taunted Mr. Forster with unwillingness to bring Mr. Dillon to legal book for his words, and triumphantly asked how, this being the case, he could have a right to call Mr. Dillon a coward. Both these facts seem to point to a curious, if not altogether novel, difference between English and Irish standards of bravery. It is a very short time since in Ireland it would have been thought not in the least cowardly for a practised duellist to call out an inexperienced boy. It is evidently at the present day thought not in the least cowardly to hack and torture the animals who are the property of obnoxious persons. It is therefore not surprising to see that Irishmen, or at least that some Irishmen, should fail to see that the conduct of an agitator is of itself, and in its essence, cowardly. He never runs the same risks as those whom he eggs on. He has all the advantages of the agitation, they have all the disadvantages. He has, owing to the wise or unwise tolerance of the English law, nothing to dread but insignificant imprisonments, and there is very little chance of his suffering these. They have to face the rifle and the gallows. This sort of conduct, under these circumstances, is what we in England call cowardly. In Ireland it seems to be heroic, and persons who pursue it deserve the supreme honour of being spoken of by their Christian names, like Mr. Gladstone in the heyday of his popularity. A favourite subject for Irish orators to declaim on is the inequalities which beset Irishmen. We are not ourselves aware in what those inequalities consist, except in being generally spoilt and petted, while Englishmen and Scotchmen have to make their own way in the world, and their own moan if they fail to make it. But here is an inequality which really deserves a little attention. Suppose the gentlemen who talked on Monday night were to get their morality a little more up to the level of that of their neighbours on such points as the obligation of the Eighth Commandment and the manner of behaving to brute beasts. When they have done this they will display their injured innocence to a good deal better advantage, and that awkward difficulty about Mr. McCarthy's major and the "men of honour and intelligence" will vanish.

VALERANDUS POLLANUS.

THE French refugee, Wolrand Poullain, is scarcely known in England except by the Latin form of his name, which we have given above. He probably could speak little and write less in our language, and has hitherto been scarcely known to English readers except from three Latin letters written by him to Cecil in November 1551, about the affairs of some French weavers who had been granted a settlement at Glastonbury. These letters were printed by Strype from the Lansdowne MSS. in his Memorials of Archbishop Cranmer. The letters themselves contain nothing that is worth commenting on. It may be observed that they seem to justify the first half of Strype's description of him as being "a man of great worth, both for learning and integrity." He certainly wrote very fair Latin; but as to his moral character we have no evidence one way or the other, and doubt very much whether Strype had any other means of judging than we possess. It was enough for this partial

writer of history to know that Alasco and Poullain had been granted by Edward VI. the titles of Superintendents of the Strangers' churches in London and Glastonbury, in order to enable him to add the flourish that the title was given to each to fix a character of honour and esteem upon their persons. Neither is there any evidence to support his conjecture that it was intended perhaps to exempt them and their churches from the jurisdiction of the Bishops of those respective dioceses. It is likely enough this may have been the intention of the Privy Council of the day; and if so, there was the further purpose on their part, for which there is elsewhere abundant evidence, of assimilating the government of the Church of England, as soon as it might be practicable, to the form established under these two Superintendents at London and Glastonbury.

The mode of performing Divine Service in the Belgian Church in London has been described by Alasco. This work, which was written in Latin and immediately translated into French, was not printed till 1555. And if the Reformers who framed Edward VI.'s Second Prayer-Book of 1552 had this volume before them, as it seems probable, it must have been in the form of manuscript. But Poullain's description of the form used at Glastonbury, which was identical with that which had been used eight years earlier at Strasburg, was published the year before that Prayer-Book came out. It bears date 19 February, 1551, and the Second Prayer-Book of Edward's reign came into operation in November of the following year. Neither of these works has received the notice that it deserves at the hands of historians of the Reformation. It is certain that both of them exerted considerable influence on the nature of the changes adopted between the summer of 1549 and the autumn of 1552. As to the latter work, Burnet does not even once refer to it, or indeed to its author at all, till the reign of Mary, when he published his account of the disputes between the Roman Catholic and Protestant parties held on the 18th and five following days of October 1553.

Alasco's influence on the minds of the English Reformers is beginning to be tolerably understood. Of that and of the work to which we have already referred we desire to say no more here, but wish to call attention to Poullain's account of "the use of Strasburg," because of its striking similarity in many of its forms to the services adopted in England in 1552. This little volume, again, has for the most part escaped the notice of writers on the history of the Prayer-Book, Mr. Blunt's commentary having alluded to it only in the most casual way, and the only account of it we have seen being in a note to the first of Archbishop Laurence's Bampton Lectures. It was published with the date, 19th of February, 1551, from Westminster, and is dedicated to the King as "Catholicæ Fidei vero Defensori"; and in the dedication the author speaks of the King as having attained his fifteenth year. As Edward only completed his fifteenth year on October 12th, 1552, this would fix the date February 1551 as meaning, according to the English computation, 1552; but, though the author may have been mistaken as to the exact age of the King, he being a foreigner, he could not possibly have been ignorant whether Bucer, whom he mentions in the preface, was dead or alive. And, as Bucer died February 28, 1551, the appeal to Martyr and Bucer to witness that he has described the rites and ceremonies of the Church at Strasburg faithfully proves beyond all doubt that the date is 1551. The exact year of the publication is of some importance, because, if it had been published a year later, there would have been less ground for arguing that parts of the English Prayer-Book were taken from it.

What is most remarkable in the connexion of Poullain's work and the English Prayer-Book of 1552 is the point, which Archbishop Laurence has entirely missed, that the alterations from the edition of 1549 were in the direction of the teaching of Calvin and Zuingli as opposed to that of Luther. The personal influence of Bucer had ended with his death at the beginning of the year 1551. He had been all along the mediator between the Zuinglians and the Lutherans; and the school of Strasburg, which was represented by him, was steadily setting in towards the Calvinistic views which upon the whole somewhat prevailed over the Zuinglian at the Consensus Tigurinus in 1549. Alasco and Poullain were both still living, the latter being less hostile to Luther, and probably thinking, with his master Bucer, that an amalgamation between the Lutheran and the Zuinglian views was quite possible, in face of the dangers that appeared likely to arise from the dissensions of Protestants. And thus it has happened that the Archbishop, with scarcely any misrepresentation of the facts of the case, has used them for the purpose of supporting his thesis that the Reformation in England was all along conducted according to the Lutheran theory, because the expressions used in the Prayer-Book and Articles of 1552 were not more definitely and pronouncedly Calvinistic than they are. There is a copy of the scarce little volume which gives an account of the mode of conducting divine service at Strasburg amongst the Tanner volumes in the Bodleian Library. It is for the most part, as Archbishop Laurence describes it, a Latin translation of Calvin's French Prayer-Book, drawn up for use at Geneva, which he himself afterwards translated into Latin and published in 1545. The author speaks of the similarity of the uses of Geneva, Lausanne, Neufchatel, Bâle, and Zürich. It consists of thirty-nine leaves only, not paged, but foliated. It is well known that the Exhortation, Confession, and Absolution in the Morning and Evening Service, together with the insertion of the Ten Commandments in the Communion Service, distinguish the second from the first Prayer-Book of Edward's reign. In the very first rubric at morning prayers, where we have the direction to read with a loud voice, we have the translation of Poullain's *clarâ et distinctâ voce*. The Ten Commandments, which are placed next in the Strasburg form, are replaced as ours by the sentences of Scripture. The exhortation ending with "me præeuntem sequimini his verbis," has been lengthened into our "Dearly beloved brethren," ending with "Accompany me with a pure heart and humble voice unto the throne of the heavenly grace, saying after me." As the Confession which follows has never appeared in an English dress, we venture to insert it at length as literally translated as possible:—

> O Lord God, Almighty and everlasting Father, we acknowledge and confess without dissembling to thy most holy majesty, that we are miserable offenders, and so from the first moment of our conception and birth as prone to all evil as we are estranged from all good, and by this our fault we are continually transgressing thy most sacred laws, and so by thy most just judgment deserve death. Yet, O Lord God, we are sorry thus to have offended thy goodness, and so we condemn ourselves and all our too-wicked deeds, praying thee of thy clemency to help us in this our affliction. Have mercy, therefore, upon us all, O God and Father, most kind and merciful, we beseech thee in the name of thy son Jesus Christ our Lord. Blot out all our faults, wash our filthiness, and grant to us, bestow upon us, and increase in us daily the power of the gift of thy holy Spirit, so that, truly and seriously understanding our misery and acknowledging our unrighteousness, we may be truly penitent; so that, being dead to sin, we may hereafter abound in the fruits of righteousness and innocence in which we may please thee; through Jesus Christ thy son, our only Mediator and Redeemer. Amen.

Immediately after this Confession there occurs in Poullain's book a form of so-called Absolution by which it is specially distinguished from Calvin's form of service, and which so far assimilates it to the Anglican Prayer-Book of 1552, although it consists only of the recitation of certain passages of Scripture selected at the pastor's pleasure, the people standing or kneeling as the inclination of each individual may prompt him.

We need not follow the work throughout. It need only be said that it throws considerable light on the mode which from Elizabeth's time prevailed in the Church of England of conducting service down till very recent times. The length of the service was prescribed to be an hour and a half, or, at the outside, when there might be a large number of communicants, two hours. There is a provision for Catechizing at Noon, the morning prayers being supposed to be at eight; and vespers, with a sermon of an hour's length, were held at 4 P.M., so as to give time for the pastor and elders of the church to consult before supper-time on the affairs of the church. The directions about baptism also are such as to remind the reader of our own service and its rubrics; whilst the denial of the efficacy of the Sacrament as being other than a seal of grace already received finds nothing to correspond to it in our baptismal service.

Wolrand Poullain's book goes beyond anything that ever actually found its way into the English Service Book; but there are many indications that if Edward VI. had lived a few years longer there would probably have been a third Prayer-book modelled more completely upon the type of the celebrated *Reformatio Legum Ecclesiasticarum*, and, as a natural consequence, more closely resembling Poullain's description of the Strasburg use. In the latter may be found the provision for publishing the banns of marriage on three successive Sundays before the ceremony takes place. The service for marriage contains an address which, among other things, states that matrimony is indissoluble except for the cause of fornication, a proviso which corresponds exactly with the statement of the *Reformatio Legum Ecclesiasticarum*, which so narrowly escaped becoming the law of the Church of England.

There are other suggestions in this little volume well worth attending to. And we have drawn attention to it because we are persuaded that the influence of its writer as well as that of Alasco on the religious history of Edward's reign has never been adequately appreciated.

MILITARY TOPOGRAPHY.

WE doubt whether there is in the whole curriculum of military training any subject which has made such strides of late years as that of military topography. It is but a few years ago that this subject was a sealed book to the great mass of the officers of our army. Not merely were they, as a rule, unable to reproduce upon paper the simplest features of any tract of country through which they might pass, or to write an intelligible description of it, but they could not even recognise them on a map when they saw one. There are numerous stock anecdotes still current in the service of old officers gravely pondering over maps which they could not read, mistaking lakes for mountain-tops, hills for valleys, watercourses for elevated ground, contour lines for foot-paths, and so on.

Now it is very different. There are few regimental officers who do not understand the use of the prismatic compass and sketching-case, and who cannot produce an intelligible sketch of a tract of average country. Every route-march during the cold weather is utilized for the purpose of describing the route traversed with regard to the distances, nature of road, streams, rivers, bridges, houses, supplies, &c.; and not merely officers but non-commissioned officers are becoming versed in elementary topography. A want of system and uniformity in the method of imparting instruction has, however, been felt for some time, principally owing to the number of text-books, as they are called, in circulation; and in

January last year a Committee was assembled to inquire into and report on the matter. Before going further we will describe the text-book system for the information of our civilian readers. The great impulse which late years have given to military science in the shape of tactics, strategy, fortification, topography, military law and administration, and the consequent educational qualifications demanded from officers who wish for advancement in the service, have necessitated study in the above subjects. On each and all numerous treatises have been written at various times by different individuals, generally officers, and the only question for an officer who wishes to study is, which book shall he select? The question is, however, settled for him by the military authorities. A certain work is selected and announced as the text-book—that is to say, that at all examinations in the subject treated the questions will be taken from it. Possibly the said book is the best in the field at the moment, possibly other motives have inspired the selection, but the result is the same. Officers are naturally averse to prejudice their chances of passing by studying other works, and the successful author, knowing that he has secured a monopoly which may possibly be short-lived, and knowing also that his circulation will be limited to military readers, charges an exorbitant price. Let us take a familiar illustration from civil education. Colenso's *Arithmetic* is pretty well known to teachers and students alike as one of the best educational works extant. But what would be the result if the price of this book was fixed at thirteen or fourteen shillings? Simply that some other and cheaper work would be at once selected. There are text-books authorized in the army, which, relatively speaking, are not to be compared to the work above named in value and suitability for their purpose, the price of which is fixed even higher than fourteen shillings; but officers are not allowed the benefit of the competition which reduces the cost of such books in civil life, and must pay the price demanded. The whole system is an anomaly in these days of cheap literature, and nothing has militated so seriously against the progress of military education as this monopoly which is enjoyed by a few at the expense of the many, and at which, as we shall presently see, the first blow has been struck. To return to our subject. A Committee was appointed, as already stated, to inquire into the subject, the composition of which certainly left little to be desired. It is as follows:—President, Sir Archibald Alison, K.C.B. Members, Colonel Creagh Osborne, Commandant Staff College; Colonel Woolsey, R.A., Director of Artillery Studies; Colonel Cooke, C.B., R.E., Director-General of Ordnance Surveys; and Colonel Middleton, Commandant Royal Military College. The objects of the Committee were—1st. To decide what text-book of military sketching and surveying shall be adopted as the typical one for military education. 2nd. To propose definitely the nature of the system by which instruction in military surveying and sketching in the army shall be governed, and to what extent it is fair to require a knowledge of military sketching from officers generally. 3rd. To define the extent to which this instruction should be carried at the Royal Military Academy, Woolwich, as affecting future officers of the Royal Engineers; at the Staff College, as affecting officers of the general staff; and at the Royal Military College, as affecting officers who subsequently have to undergo the special army examinations for promotion. The Committee preface their Report by pointing out the diversity of terms used for designating this particular branch of science, and they recommend that one term alone be employed—namely, "military topography," which term may be afterwards subdivided into "surveying," "sketching," and "reconnaissance."

With regard to text-books, the Committee "do not consider that any of the text-books now in use fully meet the requirements of the several educational establishments of the army. And this will be still less the case if the alterations they have recommended, such as the reintroduction of the plane table, &c., should be adopted. The Committee also consider it very undesirable that any text-book should be adopted in which any officer engaged in instruction in one of the military educational establishments has a pecuniary interest; and they are of opinion that all such works should be issued by the Secretary of State for War from the Department of the Director-General of Military Education; and should be the only books used for instruction in the army. The Committee do not therefore recommend that any of the text-books now in use should be adopted; but they think it desirable that one or more competent officers should be selected to compile one, which might, if necessary, be published in two parts, the one comprising sketching and reconnaissance, the other surveying."

With regard to the second subject, the Committee consider "that the nature of the system by which instruction in surveying and sketching should be governed ought to be such that, while offering every encouragement to the student or officer who is skilled, or shows a likelihood of becoming skilful, in the use of his pen or pencil, the individual who is physically unable to draw well or even fairly, and yet who may become a valuable officer, shall not be worried, and perhaps driven out of the service by a system which assumes that all men are alike or on a par with regard to the faculty of drawing and sketching." Bearing this in mind the Committee have, with regard to the third subject, recommended that taking the Royal Military College as a starting point of an officer's career in the cavalry or infantry, the cadets shall there go through such a course of topography as shall be within the scope of a lad of ordinary ability, to whom the subject is perfectly new.

Before attaining the rank of captain, an officer shall pass an examination in the same subjects that he passed in as a cadet, a somewhat higher standard being demanded. Before attaining the rank of major, he shall be required to pass an examination similar to that passed for the rank of captain, but with the addition of more detailed reconnaissances of rivers and roads. This will be the last examination a regimental officer will be called upon to pass in this subject, and it will be seen that he is required to do little more than keep up what he learnt as a cadet, which knowledge the Committee believe to be sufficient for the officers of the army generally, and at the same time necessary, taking into consideration the fact that, owing to our large colonial possessions, our campaigns, unlike those of most European nations, are usually carried on in wild countries which have never been surveyed or mapped." These recommendations strike us, on the whole, as sensible, moderate, and judicious. There is no straining after the impossible, full allowance is made for the want of special talent in individuals, and nothing is demanded which is beyond the scope of ordinary intelligence and ordinary industry.

The Committee then proceed to suggest certain alterations in the present systems of imparting instruction and in delineating ground. They are as follows:—

"1. The introduction of a regular course of lectures and practical instruction in reading maps, and in finding the way about in a strange country by means of a map and common compass.

"2. The substitution of the system of showing hill features by shading in mezzotint with stump and powdered chalk or lead from a pencil, for the one now in force of indicating them by horizontal hachures, contours being retained as at present.

"3. The reintroduction of the plane table in its simplest form.

"4. The removal of problems in heights and distances.

"5. The introduction of Watkin's range finder as an aid to surveying."

We fear that some difficulty will be encountered in carrying out the first of these, for we do not see where any "strange country" is to be found within any reach of any military station in the United Kingdom.

Suggestion No. 2 will be a welcome relief to all concerned. The present system of shading hill features, known as "hachuring" —or, more familiarly, as "worms"—is tedious, monotonous, and painfully slow. Not one in a hundred who attempt it ever really succeed in doing it well, and change can hardly fail to be an improvement. The reintroduction of the plane table is recommended on the almost unanimous evidence of officers who have worked in India. It is, however, not to supersede the prismatic compass, which is to be retained, but each is to be used where most suitable. We may mention, for the benefit of the uninitiated, that the difference between the two instruments is briefly this. The prismatic compass is extremely portable, but involves a large amount of walking, while the plane table brings your work to you at the expense of portability. The Committee point out that on several occasions during the Zulu war, the compass was rendered useless by the presence of iron ore in the hills. Suggestions 4 and 5 are matters of detail. The Committee conclude by laying down the course of study which they recommend for the various branches of the service, but which we have no space to enter upon. Altogether they may be congratulated on the result of their labours.

THE ALTERATIONS AT TEMPLE BAR.

IN the early history of London nothing is more difficult than to assign a date to Ludgate. If we believe the old-fashioned writers, it is the oldest of the City gates. If we accept the newer lights, it is the latest. The latter view is probably the true one; and it is, at any rate, not very difficult to find a time, which may be chronologically determined, when there was no way out of the City over the Fleet. When the Fleet gate or Flood gate was connected with a bridge, the road to Westminster at once joined the suburbs about Shoe Lane and St. Clement Danes with the City; and, in accordance with the custom of the time, these suburbs became wards, and had their aldermen, who, however, answer rather to the modern idea of lords of manors than aldermen. And so, when in 1279 a certain Ralph le Fevre sells his ward of Ludgate to William Farringdon, it was joined to the other suburban estate of that great alderman, and became, what it continues after the lapse of six hundred years, the great ward of Farringdon Without. The one person whose rights were invaded by this extension of the Liberties of London was the Abbot of Westminster. His manor of St. Margaret's, he contended, reached to the Fleet; and the truth of this allegation is proved by the fact that he presented to the churches of St. Dunstan's and St. Bride's. The Dean and Chapter of Westminster are still the patrons of St. Bride's; but in the thirteenth century Henry III. persuaded the Abbot to give him St. Dunstan's that he might annex it to the house in Chancery Lane which he was then founding for converted Jews. Henry little foresaw the day when a Jew would reign in the same house as Master of the Rolls, and the Abbot as little foresaw the day when Temple Bar would be gravely described as one of the city gates. The ward, indeed, can hardly be said to have been recognized before 1346, when its representatives were first admitted to the Common Council. The Fleet Bridge was in existence before 1228, and the "bar of the New Temple" is mentioned as early as the first year of the fourteenth century. Keeping these meagre facts in mind, it is curious to inquire for the mention of a time when there was no bar here. Even this

may be obtained, for in the grant of a piece of ground to Peter of Savoy in 1246, it is described as lying in the Strand outside the walls of London. In all subsequent documents it is described as lying outside Temple Bars. We know, then, that Temple Bar came into existence after 1246 and before the end of the century, and in all probability some further information may come to light on the subject before very long.

That Temple Bar was a City gate—that is to say, a fortified opening in the wall—probably few would now assert. But when the triumphal arch erected in 1670 was removed a little time ago, there was much lamentation in certain quarters at the loss of "the last of our City gates." Considering that the boundary between the ward of Farringdon Without and the parish of St. Clement Danes was absolutely unmarked by any defence, it would be hard to say what the gate, if it was a gate, was situated in. A gate implies a wall, or something of the kind. Yet we know that access could be had from the Templars' tilt yard into the "City" by various ways, as numerous, probably, as they are now, between Carey Street and Chancery Lane. The ground, Fockett's Field, or Little Lincoln's Inn Field, as it was called, on which the religious knights took their diversion, is already covered by the new Law Courts; which, if they have obliterated much that was interesting, have, also, it must be allowed, removed much that was objectionable. Among the thirty-three streets and courts pulled down there was a Shire Lane, whose very name is interesting, marking as it did the exact boundary between the county of Middlesex and the City of London. The name had, however, for some years been lost in that of Searle's Place; but Stow, who says it "divideth the cittie from the shire," adds that it adjoins Temple Bar; and this is all the mention he accords to the "gate." Shortly after Stow's time a wooden building somewhat like a toll-house, apparently, was placed across the narrow street, and on its removal in a ruinous state, the late archway of stone was made by Wren, and adorned with statues of the two Kings Charles, and of King James I. and Queen Anne of Denmark, by Bushnell. It was worth preserving, and every one is glad to hear of its re-erection in Epping Forest, though a place on the Embankment, at the gate of the Temple Gardens for instance, would have been preferable. It was designed for a City site, and will be to some extent literally out of place in the country. Mr. Street, in one of his earlier designs for the Law Courts, proposed a kind of Rialto, reaching from the new buildings into the Temple, and affording the lawyers a safe conduct over Fleet Street. It would have been a very picturesque feature in the view, and would have commemorated Temple Bar very worthily. But other counsels prevailed, and it is impossible to feel much regret that the noble street is uninterrupted—forming, as it does, a much more imposing entrance to the greatest city in the world than any archway, short of an edifice equalling the Arc de l'Etoile itself. As a memorial, and as a boundary stone, Mr. Horace Jones's refuge in the centre of the carriage way will be perfectly effectual. There can be no hesitation as to the true site of the "bar of the new Temple"; and, historically speaking, a mere monument is more appropriate to the site than a mock gateway. When Temple Bar first existed it was no more. The removal of the "Gate" is of the nature of a "restoration," as restoration is understood nowadays.

It seems to be matter for regret that in the rebuilding of Childs's Bank more reference was not had to the situation. Uniformity is seldom satisfactory, and contrast gives buildings picturesqueness; but a Gothic design over against the new Courts would have been more pleasing than the very prosaic, not to say ugly, house now completed. Like their neighbours in the Middle Temple, the firm, or their architectural advisers, seem to be under the delusion that mere ornament will make an ugly building pretty, or at least pleasing. But all the carved pinnacles and capitals in the world could not make the new buildings in the Middle Temple anything but commonplace; and, with a site perhaps unrivalled in London for the opportunity it gave for an artistic treatment, the new Bank will have to be shut out of the view when we go to admire or criticize the effect of the new Courts and their surroundings.

Although the Middle and Inner Temples are within the Bar, it is a question which has often occurred whether they are in the jurisdiction of the Lord Mayor. No settlement has ever been arrived at; one or two Mayors have been mobbed for driving into the Temple with the State sword held erect. If we remember that when the Templars removed from their house in Holborn, and came to the wider site by the river's edge, in 1118, the suburb of Fleet Street had not been made, it is quite intelligible that their house was never reckoned in the City. When they built it a marsh and a tidal estuary were between them and Ludgate, and to get within the wall it was necessary to go up "Show Well Lane," now Shoe Lane, through a newly-built street on the high ground round the church of St. Andrew. When the "Friars Preachers" came to England, in 1221, they first made good their footing on this hill, and gradually pieced together a little estate, which, when they removed in 1276, like the Templars, to a riverside site, they sold to the Earl of Lincoln. Thus, bit by bit, the ground was occupied on the north side of Fleet Street. Then, between the Black Friars and the Templars, the intervening riverside site was taken by the White, or Carmelite, Friars; and so the chain of houses, on both sides of Fleet Street, was completed, from the outlying village on the hill, crowned by St. Clement Danes, to the bottom of the valley, over which the towers of Ludgate looked out. It is not so difficult to picture to oneself the state of the "suburb" at that time if we remember the fluctuations of level which are still encountered between Temple Bar and Ludgate Circus. Opposite Chancery Lane it is 38 feet above high-water mark, but only 20 feet at St. Bride's and 15 feet where it crosses Bridge Street. There is a depression also just outside Temple Bar, a depression probably marking the place where a little brook once ran, of which Milford Lane recalls the memory. A brook and a mill and a ford would look strangely out of place there now, but the names preserve them as matters of history; just as the City still pays rent for a certain tenement called the Forge, probably burnt by Wat Tyler, which stood over against Milford Lane, and was the armourer's shop—a natural adjunct—when the knights tilted in Fockett's Field. One ingenious writer has supposed that Milford Lane marks a ford over the Thames, while another cites a discovery of mediæval pottery in Chancery Lane as a sign that Fleet Street was occupied by the Romans. It is somewhat strange that so many books have been written about Old London, and that so few writers have followed the good example of Stow, who both made up the early records and also walked over the ground. In a recent book about Temple Bar there is not so much as a single mention of the Outer Temple. It would stand to reason, we might suppose, prior to experience, that, if there is a Middle Temple, and if there is an Inner Temple, there must have been an Outer one. It was not given to the lawyers, but was occupied first by a bishop and afterwards by a line of earls, one of whom, Essex, was here besieged after his abortive rebellion towards the close of Elizabeth's reign. But perhaps the most important fact in the history of the Outer Temple is that the present streets and lanes on its site were built by Dr. Nicholas Barbon, or Barebone, the son of Praise-God Barebone, M.P., and nephew of If-Christ-had-not-died-for-thee-thou-hadst-been-damned Barebone, of Cambridge, who, we regret to say, was usually known by the last syllable only of his Christian name.

MOUNT ATHOS.

MEDIÆVAL Greece has been so far removed from us by the events of the last half-century that we have to be grateful to the survival of such an historical institution as the religious commonwealth of Mount Athos to recall to us in many ways what once was the prevailing type of Greek civilization. But for this reminder it would be difficult to imagine the time when Greece was informed by the spirit of unprogressive prosperity we see now among the recluses of the sacred peninsula, the time when labour throughout the country was so cheap and so productive that men were content to earn with small pains the necessaries of life, careless of a wealth neither required for their comfort nor agreeable to their indolent temper, and when their employers saw their rich rents so ample and so constant that they found no reason for tampering with the existing state of things, to improve their lands or the condition of their labourers. The grain-ships of the Euxine filled the harbour of Athens as in the days of Pericles; and no one cared to repair the roads destroyed by Bulgarian invaders, so as to carry the produce to the inland districts which the same cause had made dependent on it by turning all tillage to grazing farms. Industry, if we except the silk manufactures of Athens and Corinth, had small interest to a people of primitive manners; and, save in the port of Monemvasia, the shipping of the country was limited to an inconsiderable coast trade.

Such an outline of the state of Greece at a time when the West was aflame with the first ardours of Crusading enterprise will find a distinct reflection in the modern life of Mount Athos. The peninsula enjoys a virtual exemption from the amenities of Turkish rule. The Sultan, it is true, has his Governor there; but the activity of the Aga is restricted to the receipt of a fixed and moderate tribute of perhaps 800*l.* a year. He has rather the ornamental position of the Byzantine exarch on the sea-board of Romagna than the vigorous reality of the Ottoman Kaimakam. The Holy Mountain forms to all intents and purposes an independent republic. Twenty representatives, from as many religious houses, hold their *protaton*, a triennial Parliament, at Caries. A committee of *epistatæ*, elected by each in turn, performs the functions of an executive. This is the popular Government, which stands to the monks as the symbol of a national existence. It is a mere phantasm of a democracy. The churchmen of Athos are not those who, in the phrase of Mme. de Staël, have taken their memories for hopes. They are content to survive on memory, careless even of the present. The monasteries are not wealthy, unless a few are enriched by the piety of Russia; but their rents in Wallachia, the husbandry of the monks, and their handicraft in relics and sacred wares, allow them enough prosperity for their modest ambition. A rotation of meals, devout exercises, and homely labour satisfies, if it does not expand, their spiritual cravings; and, with a storehouse of learned treasure around them, their commonwealth stands almost alone among religious establishments in not claiming a single scholar. To the inquiry of a traveller as to this listlessness about intellectual concerns the only reply was, "We have no time; when some of us are praying the rest have to mind their handiwork." The name even of Herodotus, their first historian—for it was he who recounted the wonderful canal of Xerxes—was unknown. "Was he a Church-writer?" (Ἡρόδοτος; ποῖος εἶναι; εἶναι ἐκκλησιαστικός;)

To what this lack of impulse is attributable we need not now inquire. We wish rather to forget for a moment the people in

the outer glory of their surroundings. We have it rendered, with that fidelity and clearness which seem almost the peculiar possession of the Frenchman, in a recent book by the Abbé Alexandre-Stanislas Neyrat, to which we gladly take the opportunity of calling attention, *L'Athos: Notes d'une excursion à la Presqu'île et à la Montagne des Moines.* (Paris: Plon et Cie.)

The bare peak that dominates the North Ægean gives little more than its name to the sacred peninsula. It stands sheer from the sea six thousand feet and more, and looks over the headlands of Longos and Cassandra to the mountains of Thessaly, the mountains that give its background to the oldest Greek history, Othrys, Ossa, Pelion, Olympus. It looks down upon Thasos and Samothrace, Imbros and Lemnos, and others of the multitude of islands standing out, as in profile, on the horizon. But you have scarcely left the chapel of the Transfiguration, which caps the summit and which carries one's thoughts back to the time when the Holy Light of Mount Tabor was the object of superstitious reverence and the pretext of angry persecution by the monks of the peninsula, before you have passed into a different climate, a tract little higher than the Forest of Mar, and sharply contrasting with it in its wealth of wood, oaks, chestnuts, beeches, and higher up its mass of pines. As you descend to the valleys that cut the outline of the hills, the forest changes to the delicate underwood of the Mediterranean, which, with wild figs and vines, makes a boundary between the grandeur you have left behind and the huge planes that spread themselves down the hollow beds of the mountain gullies. The district is full of surprises. Engineers have not taught the roads to take the nearest and tamest course. Every sight broadens out in a miraculous variety of form and colour. There is no monotony, even in the buildings. In one place a ravine runs down to the sea between sharp cliffs; a huge rock in the middle gives foundation to a hermit monastery, named after the hermit saint, Simon. Joined by a bridge to the overhanging mountain, it is inaccessible save to the practised feet of the convent mules, and even so accessible only by sea. Other houses, as that of St. Paul, crushed between sea and mountain, have no room for growth except upwards, and expand in a grotesque protuberance of window and balcony from their yellow walls. But most are small towns, or small fortresses, as they rather seem, spreading loosely in quadrangles. Nor is there a greater uniformity in their internal arrangement than in their outer structure. All, indeed, conform (in Western parlance) to the rule of St. Basil; but in some, the less rigid, the "idiorrhythmic" monks are free to live and eat in their cells; in others the "cenobites" are forced to a common refectory. There are dependent monasteries, or *ascoteria*, which serve as farms to the greater houses, and where the religious husbandmen enjoy as much liberty and comfort as they please. And, finally, there are the anchorites, buried in caves or rude huts, and relying for subsistence on the care of the neighbouring monks, or the charity of passers-by. The traveller is often arrested and reminded of the existence of these strange solitaries by the sight of an iron chest placed at the roadside to contain his dole. The charm of the communities of Mount Athos rests on their separation from the modern world. With a hospitality worthy of another and more distinctively Oriental creed, the guest receives as by right whatever the monastery can give. The meals he has are simple; this is inevitable in a place where flesh is not eaten, and where eggs and milk have to be imported from the nearest islands; but there seems no limit to their frequency. The only pause is when the refectory has to be turned into a sleeping chamber (we cannot say a bedroom) for the stranger. The younger monks and the mules are always at his service for guidance and carriage; and, unless a work of repair or building gives special opening for bounty, the traveller passes through the district without spending a single obol.

This is the picture which M. Neyrat brings before us with unfailing freshness and interest. It needs only to be noticed that he is a little too credulous about the traditions of the peninsula. He hints at Arcadius, or even Constantine, as founders of religious houses here; but there can hardly have been any monasteries built until the very end of the ninth century, for in 885 Basil the Macedonian had to protect the "holy hermits of the Peninsula," plainly as new comers (they are described as dependent on the monastery of Hierisseus), against the hostility of the people. The rapidity of its growth gives colour to the antiquity arrogated by the monastic commonwealth; and the splendour of the foundation of such a house as that of St. Dionysius seems repugnant to any theory of newness. Yet this preserves its charter, a gorgeous roll fifteen feet long, in gold and ultramarine, with the portraits of its original patrons, Alexius III. and Theodora.

We have spoken at length of this unique "survival," because there is reason to fear that the old conservative spirit is decaying. It lived through the shock of 1821, when the quiet monasteries became for a moment the seat of war. But now there are signs of an interest in secular things, even politics. M. Neyrat was questioned about the Conference at Constantinople. And the monks who, a thousand years ago, rushed down in mad fray from their hiding-places on Olympus, Ida, and Athos, to do vengeance on the Iconoclasts, are now found ready to welcome schismatics far more widely separated from them in opinion, for the very reason that M. Neyrat and his friend were the first priests of the Latin Church who had ever sought a welcome from their fellow-Christians of the Holy Mountain.

DEAN SWIFT ON CONVERSATION.

It is generally acknowledged that the art of conversation is dead. When and why it died appears to be uncertain, but the wicked nineteenth century is held in some obscure way to be responsible for the unlucky demise. Now, it is quite true that our conversation now is not much to boast of, but still it is a little early to despair of its ever improving, nay, of its even attaining the height to which it reached in its palmy days—whenever they were. For, be it observed, that this is no new lament; like so many other complaints of the degeneracy of our times, it has been made continually before. For instance, one would imagine that, if ever the art was flourishing, it was in the days of Steele and Addison, Pope and Swift. But who can read the "Polite Conversation" without feeling that it is substantially what Swift declared it to be—a faithful record of the ordinary conversation of good society, with which our own commonplaces may be very favourably compared. Of course it may be maintained that this was all an invention of the wicked Dean, and that society in his day would have scorned to talk the stuff that he puts into its mouth. But there are some things beyond the invention of any genius, and we are persuaded that the "Polite Conversation" is one of these. It bears the stamp of truth in every line of its hideous sprightliness. Again, in Swift's admirable *Hints Towards an Essay on Conversation*, he says that he was prompted to write on the subject by mere indignation at the current neglect and abuse of so useful and innocent a pleasure. And we can see from the list of common errors that he has drawn up with so much care that conversation in his day suffered from much the same shortcomings that it does in ours. As the first step towards the revival of the art we cannot do better than give a short abstract of this list of common errors.

There is, first, talking too much, the commonest fault of all, the greatest offender in this respect being the sober, deliberate talker, who abounds in unimportant details. Then comes talking of oneself, generally taking the form either of self-praise, or else of self-depreciation—both with the same object—the latter being what we call familiarly fishing for compliments. Then there comes the tiresome egotism of persons who have been at the same school or college together, and who condemn the rest of the company to silence whilst they are refreshing each other's memory "with the arch tricks and passages of themselves and their comrades." Then is held up to ridicule the "great officer of the army," who listens to everything with silent contempt until he thinks the time has come for deciding the matter in a short dogmatical way, after which he again relapses into ill-tempered silence. Then Swift lashes the professional wits: "It is a torment to the hearers as much as to themselves to see them upon the rack for invention, and in perpetual constraint with so little success." And he goes on to say that the worst conversation that he ever heard in his life was that at Wills's Coffee-house, where the wits used to assemble. We think we may congratulate ourselves that this class is now practically extinct. The professional buffoon is next put in his proper place—that is, in large gatherings of fashionable people who cannot talk themselves and want some one to amuse them; but anywhere else he is insufferable. The next error is pedantry, which Swift defines as obtruding our own knowledge where it is not wanted, so that women are guilty of it "when they are over-copious on the subject of their petticoats" as much as even philosophers and divines when on their own hobbies. Ill-natured repartee is another common fault, a perversion of old-fashioned raillery, which is defined as saying "something that at first appeared a reproach or reflection, but, by some turn of wit unexpected and surprising, ended always in a compliment, and to the advantage of the person it was addressed to." This art is now so completely extinct that one is inclined to doubt if it ever existed. Then there are the kindred faults of interrupting others and not bearing to be interrupted oneself; a variety of which is practised by those people who are too polite to interrupt, but never pay the least attention to what others are saying.

The question of storytelling is rather a nice one. Swift regards it as not altogether a contemptible talent, "considering how low conversation now runs among us"; but he justly remarks that the storyteller should change his company very often, "that he may not discover the weakness of his fund." And, indeed, this is the melancholy part of the storyteller's life, that, however agreeable he may be as an acquaintance, no man in his senses will consent to become intimate with him and stand the fire of his eternal repetitions. We believe he never marries—even a woman's devotion has limits. Such are the pitfalls that, according to Swift, beset the art of conversation; and his remarks apply with undiminished force to us. The list, although a long one, is still not exhaustive, as we find in Cowper some new classes of talk-spoilers. Such are the grimacers, who "assent with a shrug and contradict with a twisting of the neck, are angry with a wry mouth and pleased in a caper or minuet step"; the emphatical, "who ram down every syllable with excessive vehemence and energy"; the half-swearers, "who split and mince and fritter their oaths into *gadsbut*, *adsfish*, and *demme*"; and "those who nickname God's creatures, and call a man a cabbage, a crab, a queer cub, an odd fish, and an unaccountable *muskin*."

No doubt the list might be still further enlarged, and perhaps enriched with specimens peculiar to our own day; but the mere enumeration of errors to be avoided is not sufficient to create an art. Is there no great principle which can be laid down as the basis of a revived art of conversation? We think there is, and we will proceed to develop it with the modesty that should ever

B

grace the announcement of a new discovery, however important. And, first of all, it is hopeless to endeavour to revive the past. If conversation ever really flourished, and we almost doubt it, the conditions which produced this vigorous growth have passed away. What success it had was certainly owing to the men of genius who devoted their lives to it. Nowadays men of genius have other things to do. There are never very many of them, and they are not now allowed to waste their time. If talk is to be revived at all, it must be popularized, like everything else, and brought within the capacity of commonplace people. Now there is one way by which even the stupidest of us may make his utterances invariably interesting and often amusing, it is—here comes the great discovery—by telling the truth. The reason that the conversation of fools is so barren is that it is never their own; it is a repetition of what they have heard or read last, and always spoilt in the re-telling. If they would only tell us their own minds, their real thoughts and opinions, their likes and dislikes, their principles and their weaknesses, we should not be left in such hopeless ignorance of whither the world is tending; for, after all, the fools are the most important class; the clever men may preach and write and work, but, with all their effort, they can only slightly divert the course of the great solid block of ignorance and prejudice that rolls on so steadily throughout the ages. If the wise could only understand the foolish, they might make the world go their own way; but the foolish echo the words of the wise and keep their thoughts to themselves. And how good a thing would it be if women would only speak their minds! There is nothing that honest men desire more than to understand that mysterious race that is so like them, and yet so unlike, who share their homes but not their thoughts, who are so shrewd, so practical, and so irrational. The poor men yearn to break down the invisible barrier and see into the real life of those they love so well; but the loved ones smile and chatter and say pretty things, and ingenious things, and things they have borrowed from men and improved in the borrowing, but never one word of the real thoughts that are working in their busy brains. So the men flatter and lie because they think the women like it, and the women accept it all because they think it is man's nature; and the men think women are empty-headed angels; and the women think men are fine intelligent brutes; and the two classes go on loving and despising one another accordingly, and all for the want of a little truthfulness in conversation.

After this flight in the higher regions of social philosophy we will consider the humbler aspects of our subject. We have heard the contempt with which Swift speaks of the conversation of wits, thereby exploding a common fallacy that good talk must be brilliant. Now it is our firm conviction that wit has very little to do with the pleasure of conversation. No one really cares to have his neighbour letting off intellectual fireworks under his nose. The feeling aroused by such exhibitions, when successful, is that of envy and hatred at not having done it oneself. When unsuccessful, of course they are the dreariest of known entertainments. The real interest of conversation consists in the endless opportunities it gives for mankind's proper study. The variety in people is incalculable; it is only their habitual utterances that are so terribly uniform. How fascinating are the little glimpses that a great novelist will give one into the secret workings of a vulgar nature! Now, a London dinner party might be full of such glimpses, would people only speak their minds. And it is not only to the listener that a change of this kind would be advantageous. If one were under the obligation of always telling his real opinions, he would be more careful how he formed them. There are many things that a man believes and acts upon, but which he has never formulated even to himself, and of which he would see the absurdity the moment they were put into words.

It is unnecessary to dwell on the increased tolerance that would be gained for unpopular opinions by the habit of candour in general conversation. It is a curious part of our conventional civilization that is quite allowable for a man to hold opinions which it is nevertheless highly indecorous for him to express. In an age when so many people gain all their information from social intercourse, it is a pity that they should have so little opportunity of hearing the opinions of the various minorities who perform the indispensable function of an intellectual Opposition. It will perhaps be said that we are taking too serious a view of conversation, which, at the best, is merely a harmless idle way of passing the time. If so, we are sorry for it. The amount of conversation in the world is so great that it is a pity if it cannot be made to serve some useful purpose. It is the only possible means of a right understanding of our fellow-creatures; but when we try to use it as such we gain nothing but an intimate conviction that "la parole a été donnée à l'homme pour cacher sa pensée."

THE PENNINE RANGE.

THE love of solitude, the spirit which seeks to commune with Nature in her remote haunts, with woody precipice and silent glen untrodden by human foot, is perhaps less common now than it was in the time of Rousseau or of Wordsworth. Majestic natural forms have in no wise ceased to be admired, but the human element has spread over them, and is recalled along with them. This is especially the case with those scenes which once were felt to be most awful in their imperviousness to man and in the vastness of their protecting barriers. Chamouni and Glencoe are sought now for the very same reasons for which they were once avoided. No accidents among glaciers or on Alpine summits to overdaring travellers can affect the mind of this generation with that feeling which eighteenth-century tourists were fond of describing as "horror," and which had for its essence the utter strangeness of the unknown region which they half sought and half shrank from.

It is among those mountain or hill ranges which fall short of the highest magnitude that solitude may be best looked for now. And in England, the region most abounding in loneliness is probably that long backbone of moorland which stretches from the south of Northumberland to the neighbourhood of Derby, and which is usually known as the Pennine range. From Haltwhistle to Ambergate, a distance as the crow flies of at least 130 miles, the traveller can walk almost on unbroken heather, save where, about the centre of the range, the valley of the Aire at Skipton, and the narrow rift of the Calder at Hebden Bridge, make brief breaks in the continuity of the chain. Thereabouts, moreover, the manufacturing districts of Lancashire and Yorkshire, on either side of the watershed, invade the valleys and stain the rivers. But even where the valleys are ruined in respect of beauty, the moorlands and woodlands above them are wide, open, and often picturesque. No one standing on the great waste of Holme Moss above Huddersfield, or at the little hamlet of St. John's in the Wilderness, on the heights over Todmorden, would dream that he was in the region of cotton and woollen mills. But it is north and south of this that the most characteristic parts of the chain lie.

From the Midland Railway between Kirkby Stephen and Carlisle, or still better from some of the eastern summits of the Cumbrian mountains, the Pennine range is seen rising like a wall from the plain in a line straight from north to south. Below it lie little hamlets at the mouth of short glens; most remarkable among these is the High Cup Gill, with its semicircle of basalt rock and its valley hollowed out like the keel of a ship, over the head of which lies the path (by courtesy so named) into Teesdale. Round this the highest points of the range are collected; Crossfell to the north, Mickle Fell to the south; from either of which the view extends very nearly across England, a varied intermixture of fruitful cultivated plain, deep valley, and mountain summits near and far, such as is rarely seen even in more celebrated districts. Westward of the great barrier, and almost underneath it, the lovely glen of the Eden winds under dense wood and broken rock; but on this side the general character is that of smiling fertility up to the base of Saddleback and Helvellyn. Eastward the country is wild in the extreme, but contains some better known spots, the most celebrated of which are the two mentioned in *Rokeby*:—

> Where Tees in tumult leaves his source
> Thundering o'er Caldron and High Force.

Few more impressive sights are to be seen in England, or anywhere, than the first of these waterfalls when the river is full; from a slender wooden bridge you hang over the torn cataract and jagged volcanic rocks; down two hundred feet of descent it rushes, like a young bull from the mountains, with tossing crest and shaggy streaming hair—"Sic tauriformis volvitur Aufidus." All round are the solemn wastes of the loneliest mountains in England; the gleaming river above the fall will lead you into their inmost recesses; go downwards, and you will after two miles arrive at a house, and after three more, if you are fortunate enough to find the way, at an inn. But if you are benighted in this spot you will assuredly know to the full the meaning of the Biblical words, "Their feet stumble upon the dark mountains." Hill and valley are equally ineligible walking; the former has more pits and morasses, the latter more cliffs and stones; but the retarding effect of either is about the same. But if the difficulty of reaching, or of getting away from, Caldron Snout is great, the reward is also great; the place has no affinity to the prettinesses in which picnic parties delight; it appeals, like a mysterious voice, to the "traveller betwixt life and death," who is bent not on momentary pleasure, but on serious toil. The High Force, five miles lower down, on a good road, is much more visited, and the inn there is the best centre for this district. North of Teesdale is Weardale, and north of this again are the tributaries of the Tyne, among which Allendale is noticeable for its picturesqueness; especially where the broken tower of Staward Peel (easily accessible from Hexham) crowns the ridge between two precipitous dells filled with wood, in one of which the brown waters of the Allen tumble between rocks. But the head of Swaledale is, except the head of Teesdale, the remotest spot in all the Pennine range north of Derbyshire; and we have always thought the fall of the Swale in the deep-sunk heathery glen above Muker, one of the scenes in the North of England which an artist would most love; yet we have never seen it painted. Thus far there has been but little limestone in these hills; in the valleys south of Swaledale it abounds; but the solid mural precipices of Ingleborough and Hardraw Force, of Malham and Gordale, are too well known for more particular description. The range falls gently down to the eastward, with lofty side ridges dividing the river valleys; and some of these heights, as Penhill in Wensleydale, and Simonseat in Wharfedale, command broad views; but none of these embrace such an expanse as the mountains at the head of Teesdale. Here, where the rivers are still among the hills, but not in the wildest part of them, are the remains of many of those numerous abbeys for which Yorkshire is famous; almost every river has one, and some have more than one. The Aire has Kirkstall, not unstained by the smoke of Leeds; the Wharfe has Bolton; the Ure has Jervaulx.

and on its tributary the Skell is Fountains, the largest of all; the Swale has Richmond and Easby; the Tees, Egglestone; while on the Wear, below Durham, Finchale Abbey is buried in its deep dell, the table-land on either side of which teems with the crowded villages of the largest coalfield in England. There are few historical reminiscences about the Pennine range in any part (except, perhaps, in Northumberland, where the Scottish forays and the wars of the Roses have made Blanchland and Hexham noticeable); but Haworth, the home of the Brontës, lying nearly at the meeting-point of the manufacturing district with the pastoral and mountainous Craven country, but yet in spirit belonging to the former more than to the latter, is a place with imaginative memories of its own. Dear also to geologists must be the little village of Dent, the birthplace of the late Professor Sedgwick, of whom we once heard a self-opinionated native (a grocer, or it may be a publican) say, "He did not know where coal was to be found, not he"; so true is it that a prophet has no honour in his own country. Nor should the late Professor Phillips be forgotten in this relation, whose pleasant book on Yorkshire (the popular book, we mean—not the more learned treatise), neither too long nor too short, full and yet not laboured or statistical, is probably the best book on any county that has ever been published.

South of Ingleborough there is no such impressive view of the Pennine range along any large portion of it as is to be had of its northern parts from the Cumbrian plain; probably Bolsover Castle, in Derbyshire, would command a greater length of it than any other place. But the valleys in which the Derbyshire Derwent takes its rise are as solitary as Teesdale and Swaledale, and in themselves fully as picturesque, though Derwent has no such resounding cataracts as belong to the more northern valleys. This river, unlike most in the Pennine range, has a direction due south, and the high barriers east and west of it keep out the approach of manufactures—whether the cotton mills of Lancashire or the furnaces of Sheffield. Its sources lie almost entirely on the millstone grit, and that formation, so largely spread all over the tract of which we have been writing, displays itself here most characteristically in the long edges of dark, broken rock cresting the tops of the moors, the steep heathery slopes underlying them, and the clear brown waters that hurry everywhere into the valleys. But the southernmost feeder of the Derwent, the brooklet that waters the Vale of Hope, has for its southern verge a steep escarpment of the mountain limestone, that has not been seen since we left it fifty miles to the north at Malham and Gordale. And indeed the point where it reappears is very similar to the point where it was left; the northward-looking cliffs and gorges of Castleton recall in all essential respects the southward-looking line of precipice of the Craven fault; and the whole effect is as if the intervening tract had sunk (how gradually or how suddenly is indeterminable), and, after breaking away from its edges, had left them standing bare and abrupt at either extremity. Be that as it may, the mountain limestone, when it has once reappeared, is in no hurry to leave off again; it covers the greater part of the Peak country, and extends into the moorlands of Staffordshire, with an aspect as stern and desolate on its upland surface as it is romantic and attractive in the narrow trenches that are cut through it, where the clearest of streams—Wye, Lathkill, or Dove—cover white stone or green water-weed, and the dark yew roots itself in the horizontal rifts of the sheer precipice. Westward, again, the beauties of millstone grit scenery reappear in the valleys of the Manifold and the Chernet. Such is the nature of the country until the mountain limestone, millstone grit, and the Pennine range itself, sink gradually into the undulating plain of the Midlands, where the Trent glides through pastoral meadows and by quiet villages, and the Charnwood hills occupy the horizon with their solitary outline, a curious upheaval of granite in the midst of one of the fattest and loamiest of counties. Should any of our readers wish to exchange their summer visit to Switzerland or Norway for a ramble nearer home, either for a few days, or for a week, or for a month, they will not easily find a better than that of which we have endeavoured here to delineate some of the characteristics.

A DEFENCE OF WOMEN.

MOST people have read, or are supposed to have read, the novel called *John Halifax*, and various other novels by the author of that work. Comparatively few people, it may be conjectured, are aware of some of the distinguishing characteristics, chief among them a fixed hatred and a mischievous contempt of women in the abstract, of the author of *John Halifax*. Nor, we must confess, should we ever have become acquainted with these deplorable traits, but for the ingenuity and industry of Mrs. Horace Dobell, who, in a little volume headed with the title *Versus a Woman; Pro Women*, has set herself to the noble task of demolishing the terrible propositions advanced, as she informs us, by the author of *John Halifax*. The opening of Mrs. Dobell's onslaught shows us at once that she is nothing if not critical. She has heard, she tells us, readers who complained of "Ouida's" style as "gaudy," and of Mrs. Wood's as "too plain," recommend their friends to read *John Halifax*. She supposes that this book appeared to their readers to be the "juste milieu," while she is certain that it is almost universally considered the best specimen of its author's style. Mrs. Dobell, however, finds this peculiarity in the works of her author, that the style is not equally good in all of them, and in one she is much offended by "the puzzled authoress finishing her meditations with a weary, indecisive 'And yet.' . . . And so ended the paragraph and our reading of the book for the time being." This, however, was nothing to what was lying in wait for Mrs. Dobell when, tempering justice with mercy by recollecting that "authors are often given to changing their original style for one somewhat different," she took up "a much later work by the same pen (*Young Mrs. Jardine*), quite recently published, indeed." Here she came upon no less appalling a sentence than this:—"The man who has will to choose, courage to win, and faithfulness to keep, is almost unknown to modern chivalry; as rare, alas! as the woman who deserves to be thus adored!" Mrs. Dobell appears to have been at first "struck all of a heap" at such language as this. Then, passing by the sentiment about men, she is filled with a fine compassion for one who "passes through life blind to the noble and sterling qualities which may lie dormant in our humanity at times, but yet, as history has shown, ready for manifestation when needed or demanded"; then she has a fling at mothers who call such books "womanly"; then another fling at an imaginary cynic of her own invention, who might say, "*Very* womanly, indeed! For did you ever know a woman speak well of her sister woman?"; and finally, when she comes to another passage, a noble wrath takes the place of all other feelings in Mrs. Dobell's mind. She is still, at the end of two pages, "sorry" to see "this authoress join that common and, we must consider, *vulgar* class of women who 'run down' their own sex," but she is compelled to "protest, with all the energy of strong indignation, against her shameful statement that '*It is generally the women, not the men, who make and fan family quarrels!*'" But there is a sure antidote to this poison close at hand. We have, to refute these baseless but pernicious statements in *Young Mrs. Jardine*, the assurance by Mrs. Dobell that certain family quarrels, in which she herself has been involved, "were first begun, and afterwards kept up, by brothers, uncles, and male cousins, in spite of many anxious and earnest attempts at reconciliation on the part of the female relations on both sides, especially by the present writer on the one side and the female cousin on the other." Nothing can well be more conclusive than this, and it was hardly necessary to give us in addition some hearsay evidence as to a similar part having been taken by women in similar family quarrels. After this Mrs. Dobell's wrath gives way to a mild regret for the time when the author of *Young Mrs. Jardine* had not yet asserted that women were "feeble, useless, half-educated, taught to believe that ignorance is amusing and helplessness attractive." When we have read this, says Mrs. Dobell, we are, or should be, inclined to ask ourselves, "Is it, can it be *this* age of which this author writes, this age when education is so 'heavily weighted,' as our sportsmen would say—*this* age of School Boards, of female authors, female surgeons, female lecturers"—in short, this so-called nineteenth century? The indignation aroused by the terrible sentiment quoted above carries Mrs. Dobell through some fifteen pages of talk about Zimmermann, Miss Braddon, a little knowledge, untiring nursing, roses, violets, and other sweet-scented flowers, Mr. Charles Reade, Professor Owen, the electric light on microscopic faults, Rhadamanthus, a Mrs. H—— C—— who nursed the sick in the Crimea, Solomon, the Peculiar Church, and many other topics, which are brought to an end by a repetition of the sentence which has caused all this turmoil.

This, however, is but the beginning of Mrs. Dobell's task. From such general denunciations as those we have referred to she goes on to detect and hold up to execration various minor sins in her author, and in doing this she becomes more entertaining than ever. Having informed her readers that, from governing England to hoeing wet turnip and mangel-wurzel fields, all the real work of the world is done by women, she recurs yet a third time to the monstrous statement in *Young Mrs. Jardine*, and is moved to exclaim, "If she [the author] had been so fortunate as to have been associated with families greatly superior in rank to her own, she would have found them"—or at least would have found the members of a family which Mrs. Dobell is pleased to speak of by name—"highly educated and witty, well-informed as well as well-mannered." This is pleasing information, both as to the people designed and as to the writer's appreciation of them, and it is no doubt a fine sense of satire which causes the statement to be followed by this observation. "Although the authoress of *Young Mrs. Jardine* professes to be familiar with families of the first rank in England, she asserts, as though *to* her and *by* her an everyday and well-observed thing, that *a duke will ride in a second-class carriage, and a duchess come down to breakfast in a linsey gown.*" As to the duke's conduct, all that the writer can do is in the first place to suppose that the fact of a duke's "riding" (an expression which she does not fall foul of) in a second-class carriage was occasioned by there being no room in the first-class, since "even dukes cannot in these days turn out first-class passengers to make room for their noble selves." She hopes, she feels "*almost* sure," that the author of *Young Mrs. Jardine* did not mean that "dukes *might* exercise such power if they chose." As to the statement, as a matter of fact, the thing "has, no doubt, been done simply as a 'fad' occasionally, a piece of amusement or eccentricity." But if dukes sometimes do "incongruous things," that is "no reason why *we* should do them." The dreadful suggestion about the duke leads the writer into a fit of compassion for a country girl who might travel in a second-class carriage, hoping to meet there "young Lord Thomas, or his Grace of Clodhopper," who might take her for "a lady, perhaps a countess," because all his relations now dress in plain

materials. After which our ingenious writer indulges in some pleasantries of a strange and not very savoury kind concerning second-class carriages; and then, anxious to give every one his or her due, gives the object of her attack such support as her conscience compels her to give by telling us that there really once was a "certain nobleman" who "even exceeded our authoress's conclusions, for he went *third* class!" It is, however, on the subject of the duchess and the linsey gown, as might be expected, that Mrs. Dobell is strongest. She would like to know how often the author of *John Halifax* has herself seen a duchess at breakfast in such a dress; and with a fine modesty she gives us the experience of "one who" not very long ago "*did not do so.* Her Grace the Duchess of—— was attired in a rich plum-coloured velvet dressing-gown, lined with white satin, and trimmed with deep Valenciennes lace." This was indeed lofty, and it is difficult to be too grateful to people who give us such glimpses of what in the neighbouring city of Paris they are apt to call "Higlife." One blunder of course begets another, and the unfortunate author who writes "such absolute nonsense about the mean attire of the upper classes" is but a little more absurd in thinking that *parvenus* delight in splendid equipages and sumptuous living. But, as before, the correction follows happily close upon the mistake. Mrs. Dobell happens to be acquainted with one of the most noted *parvenu* families in London, and even knew them when they lived in lodgings. "Only last week" she met the husband driving about in a perfectly unpretending brougham, and she has frequently found his wife "dressed in plain silk or cashmere" at a luncheon "of a simple everyday description." Here, then, is another of the outrageous statements found in *Young Mrs. Jardine* demolished.

It must not be supposed, however, that the talent of the critic whose work we are considering is confined to the mere pointing out and correcting patent blunders about the ways of "the nobility" and of *parvenus*. She has also a pretty taste in satire, and has no doubt that the author who so much offends her "plays like Arabella Goddard, sing songs too difficult for Jenny Lind to compass," and can "discuss with equal pleasure the works of Racine, Corneille, Voltaire, Alfred Mussard (*sic*), Sévigné, Victor Hugo, and others." Later on the critic is tempted into a digression arising from the candid observation that, after all, the works of women novelists sometimes suffer from an "absence of reliable worldly knowledge." It is indeed remarkable, as she observes, "how ignorant some people may remain of the characters of those amongst whom they live." Here, again, personal experience comes in with apt illustrations. Mrs. Dobell knew a family in which the sisters were absolutely ignorant about the world, and in which the brothers all committed various crimes, while "the only one we personally knew, and really liked and believed in," a young man of many accomplishments, was discovered, after all, to be no better than he should be. The sisters, in spite of their ignorance of the world, "are happily married." This experience seems so striking and so pertinent to Mrs. Dobell that she repeats it with slight variations a few pages later on. This seems the more unnecessary because the writer is acquainted with another "remarkable case," that of one of the loveliest girls in England, "with an oval-shaped face, fair skin, with a very maiden-blush colour on her cheeks, large, dark-blue, rather timid eyes, and rippling brown hair." Her mother "never liked her to walk the streets, even when not alone, unless heavily veiled." Family misfortunes compelled her to go on the stage, which she left in disgust because of "being intolerably persecuted by the vicious admiration of a certain theatrical critic, a married man, who threatened that, if she continued to treat his advances with scorn, he would ruin her by his adverse criticisms, which it was said he certainly had the power to do." Soon afterwards she made a happy marriage with a man of excellent character and position, and of course there can be no stronger proof of the total depravity of men and the supremacy of women. And after all this it is abundantly clear that the author of *Young Mrs. Jardine* could not on a certain occasion have been "one, like the present writer, among the crowd of interested men and women," who listened "to the learned and sensible papers read out by women to a large and critical assemblage of listeners, on more or less difficult and practical subjects." On this occasion, we are told, learning, good common sense, practical knowledge, and ability were developed to an extent that astonished not only people holding the debased view of women expressed in *Young Mrs. Jardine*, but others with far larger views. This is good news, and it is pleasing to find that if Mrs. Dobell has, by her string of personal experiences and remarks, even partially repaired a great injustice, she will feel that "her endeavours are not without their reward." With a record of this modest ambition, we may take leave of one of the very oddest, if not the wisest, essays we have ever read.

REVIEWS.

THE RACES OF AFGHANISTAN.*

Of the many able officers who have served in different capacities with our armies of occupation at Candahar and Cabul, none is more qualified to speak about the Afghans, their language, origin, and habits, than Dr. Bellew. The drawback to his latest work is that he appears in it in two very different characters. Not content with being an ethnologist, he aspires to determine knotty political controversies and to prescribe the correct course of statesmanship. Unluckily for him, ethnology and philology, though obscure and requiring close study and deep erudition, have more elements of progress, permanence, and consistency than the distracting rivalries of Oriental clans. Dr. Bellew's avowed primary object is to show what races compose that people whom, in a vague and loose way, we have been accustomed to call Afghans; whence and why they migrated; how some of them were originally Buddhists, or possibly portions of the lost Tribes of Israel; what changes they have undergone in physiognomy, language, and domestic habits; and what contributions they have made to Oriental history between the time of Mahmud the idol-breaker and Dost Mahomed Khan. Now, as we have just said, Dr. Bellew brings to this task some qualifications not easily surpassed. He is an excellent Orientalist and has a command of the Persian and the Pushtu languages. He has travelled from the Indus to the Tigris, and knows about the Cabul river as well as the Helmund and the Argandab. He has been employed as a Political officer on more than one important occasion, and the result of his speculations and researches is embodied in a clear and not unattractive style. But, unfortunately, at the back of all this erudition, we discern an irrepressible longing to enrol all these wild tribes—Pathans and Khattaks, Afghans and Ghilzais, mountaineers and matchlock-men—as British subjects and component parts of our Indian Empire.

All the author's linguistic versatility, all his historical research, all the lessons derived from unrivalled facilities for intercourse with Sirdars and merchants, with Ministers of State and heads of caravans, lead him to this one goal. He begins with Herodotus and the book of Esdras, but he invariably comes round to his own predominant theory. Now the science of ethnology has of late years made certain steps in advance. Time, intercourse, and comparison tend to establish sounder canons. Errors which were no discredit to Gibbon or Elphinstone are now easily detected and avoided by scholars of far less account. And we think it highly probable that future writers will find but little to alter or object to in Dr. Bellew's conclusions about the origin of the tribes, their geographical limits, and their connexion with races dimly known to us in the pages of Greek writers and by the revelations of Græco-Bactrian coins. At any rate we can fairly say that there is nothing wild or extravagant in the author's linguistic or ethnological theories, and that subsequent explorers will acknowledge their indebtedness to him, even if they should question some of his deductions or venture to enlarge his views. But then Dr. Bellew must needs entangle himself in the mazes of the interminable Afghan controversy, which we are not going to re-open in a literary review. It seems now to be generally conceded that all politics, and especially all Central-Asian politics, are a series of surprises and shifts. Since Dr. Bellew wrote his preface in January last, the Eastern question is hardly in the position which provoked the attack of the Duke of Argyll or needed the defence of Lord Salisbury. Without committing ourselves to any positive opinion, we may fairly say that the general consent of all parties points to no more interference with the independence and domestic policy of any conceivable ruler of the Afghans than is necessary to that security of the Indian Empire which every statesman is anxious to uphold. But Dr. Bellew goes as far as Colonel Malleson and outstrips the late Viceroy. According to him the "force of impelling and unavoidable circumstances" must ere long enrol the Afghans amongst our subjects. Sooner or later we must "administer the country ourselves, either directly or through the medium of native agency, under our own supervision." It will "ere very long be our inevitable duty to govern" them "as subjects of our Indian Empire. There is no longer any necessity to "blink" this conviction. The subjugation of the Afghan will be now to us "a matter of no difficulty." The study of these different peoples is most useful in view of their "becoming subjects of the British Empire—a lot which they themselves are far from unwilling, as a whole, to accept." There is somewhat more to the same effect; but the oddest thing is that Dr. Bellew himself furnishes a sufficient refutation of his own arguments. It is to his pages that we must turn to know what these mountaineers and desirable subjects are like, and not to a speech from Mr. Fawcett or a pamphlet by Mr. Grant Duff. The author shall himself speak of the moral qualities of these unkempt savages, whom, he insinuates, we shall find as tractable as the Jats of Upper India or no less contented with the foreigner's yoke than the unwarlike cultivators of Bengal. In the first place, this work brings out strongly the historical fact that there is no such thing, properly speaking, as an Afghan empire and an Afghan king. The whole country is a jumble of rival interests and a medley of opposing clans. They have nothing of that sleepy acquiescence in authority which has united twenty different Hindu castes under the rule of one all-powerful Raja; nor of that active proselytizing spirit which enabled one Mohammedan conqueror after another to sweep down on India with the hordes of Central Asia. Doubtless they are bound together by fanaticism; but we must differ from Dr. Bellew when he thinks an Afghan to be very like a Rajput, in that both are remarkable for a sense of personal dignity and honour. Barring certain characteristics common to all Orientals, no two races appear to us to have more points of dissimilarity. Then these mild and tractable mountaineers have been so noted for lawlessness, revenge, and brutality, that such defects have "passed into a proverb," and we are

* *The Races of Afghanistan; being a Brief Account of the Principal Natives inhabiting that Country.* By Surgeon-Major H. W. Bellew, C.S.I., late on special Political duty at Kabul. Calcutta: Thacker, Spark, & Co. London: Trübner & Co.; W. Thacker & Co. 1880.

warned that no darker record of misgovernment, "of vice, of treachery, of savage cruelty, and of oppression," is to be found in the annals of any other independent State of modern times. They "certainly hate us," and have been taught this lesson from infancy; their vices overbalance their virtues; but then they sadly want a master, and so we are bound to assume this office. The Ghilzais, of whom we have heard so much lately, were remarkable for their ferocity in 1842; but still they are by no means "implacable," and might be converted into useful friends. Dr. Bellew sums up his estimate of the national character by gravely saying that we really have no opponents in Afghanistan, except indeed the Ghilzais, who are semi-independent, and direct the policy of the Government; the Pathans, who are quite independent, and know no ruler at all; and the Durrani or Afghan, who is our only "implacable foe." Such a moralist has lived just five centuries too late. He would have posed admirably at the Court of a certain King mentioned by the philosophic poet of Shiraz, who, much against his will and at the instance of a Vizir, pardoned a young robber on account of his youth, when the whole band was sentenced to death. The lad grew up, we are told, joined a lot of rascals, and murdered his intercessor with his two sons, whereupon Sadi penned the following distich for the instruction of posterity:—

> Akibat gurg-zadah gurg shavad
> Garcheh ba admi buzurg shavad.

That is to say, in the end the wolf's cub will turn out a wolf though he grow up amongst men.

It is now time to turn to the account of the various nationalities who own no master and will bear no burden. Ethnologically they are five—the Afghan, the Pathan, the Ghilzai, the Tajik, and the Hazarah, besides some Uzbeks, and the black-coated Kaffirs, and others of less note. Without laying stress on the traditions of Afghan genealogists, or on the general belief of the people themselves, there seems nothing violently improbable in the notion that they may be a remnant of the Ten Tribes. Dr. Bellew is careful to distinguish between the Afghan and the true Pathan. The people of India apply the latter term to everyone who lives in Afghanistan, even to Tajiks and Hazarahs. The real Pathan is a Rohilla or mountaineer, and the term should strictly be applied to those who speak Pukhto or Pushtoo. This race inhabits the Pukhtun-Khwa or Pukhtoo quarter, which, we are told, is identical with the modern Suliman range and the Safed Koh, extending from the head of the Swat river in one direction and to Jellalabad in another. We must decline to follow the author into speculations as to any connexion between Pactiya and the Pakhtues of Herodotus, or the Poictiers of France, or the Picts of Scotland. The origin of the Ghilzais seems very obscure. There is a fanciful story about a Persian prince who came and wooed the daughter of a chief named Batan, settled on the Siyahband range of the Ghor mountains, and who only escaped destruction because he turned out to be of royal descent. The author thinks this tale points to an admixture of Persian blood with the original Ghilzai, which term, we are sorry to say, means "son of a thief," the disguised prince just referred to having robbed the old chief of his honour. But it should never be forgotten that the Ghilzais are barbarous, savage, and vindictive. A few take to agriculture, none to handicraft, but a great many to pastoral pursuits. Flocks and herds, however, do not win them to Arcadian simplicity from predatory habits; and when they engage in trade between Central Asia and India, they seem to take a positive pleasure in fighting their way backwards and forwards against Waziris and others, through whose territories they must pass. The fourth nation is the Tajik. He is often called the Parsiwan; he represents the ancient Persian, speaks that language, and sometimes claims to be descended from the Greek soldiers of Alexander. The Tajik is fond of gardening and agriculture when he lives in villages. In towns he becomes a shopkeeper, a trader, or a mechanic. He makes a good accountant, secretary, or domestic servant; he is credited with intelligence, sobriety, fidelity, and industry, and with a favourable inclination to the British Government. The last in the category of race is the Hazarah, and he occupies a tract extending from Cabul and Ghazni to Herat, and from Candahar to Balkh, a mountainous region with here and there some fertile valleys. They, too, speak Persian, but in feature are Tatars. It may be gratifying to be told that the Hazarahs are laborious, brave, and hardy; that they construct roads, dig wells, and build walls; and that they are in the hands of their priests, and yet are governed by their own chiefs. But their hostility to the Afghan is scarcely reason enough for concluding that they would form an excellent advanced guard for us, and would assure our military position in the event of our permanent occupation of the whole country. Practically, Dr. Bellew, whose good faith is as unquestionable as his knowledge is extensive, makes out a very strong case for those who contend that we ought to have as little to do with tribes vindictive, unstable, and very loosely held together, as may be compatible with that commanding position and that strong frontier which we must somehow contrive to hit on and retain.

Readers will do well to bear in mind the distinction between nationalities and the mere clans which are offshoots of nationalities. From the Afghans come the tribes with which Indian history of the last forty years has made us all more or less familiar. Dr. Bellew talks of eight clans, of which five descend from one common ancestor and three from another. But the special Afghan tribe identified with treaties, assassinations, contests for empire, and perpetual civil strife, is the Abdali or Durrani. It has been known under the latter title since the reign of Ahmed Shah, and the word is derived from *Dur-i-Durrân*, or pearl of pearls, the Abdali tribe wearing a small pearl-studded ring in the right ear. It is from this tribe that spring the divisions of Baruckzais, Suddozais, Populzais, Khagwanis, and no less than four others, with which we need not now trouble ourselves. It will be sufficient to bear in mind that the Suddozais at first gave birth to kings, and that the Baruckzais began as Mayors of the palace and ended by claiming sovereignty for themselves. Zeman Shah, Shah Shujah, and Mahmud—all more or less incapable—were Suddozais. The Baruckzais numbered the far more energetic Payanda Khan, Fath Khan, Dost Mahommed, and—in spite of Dr. Bellew's unfavourable comments—his son, the late unfortunate Shere Ali. Our author's sketch of Afghan history during the last hundred and fifty years is concise, and indispensable to a comprehension of the chapters on races and affinities. But, on the whole, we prefer him when he confines himself to geography and language. Some of his derivations and stories are curious and instructive. Pathan is said to mean the rudder of a ship, and to have been conferred by the Prophet himself on a Hebrew servant, who as a proselyte, was to be the guide of his people. The water-pot of Buddha, a huge bowl made out of a solid block of green stone, was carried from India to Candahar centuries ago by emigrants who fled from Brahminical tyranny, or, as the author phrases it, from Scythic invasion. This interesting relic was seen by the author in 1872, covered with Arabic inscriptions, in a small Mohammedan shrine. It need hardly be said that a self-satisfied Mohammedan doctor or *savant* would be the worst authority in the world on archæology or antiquarianism; and it is to Dr. Bellew's credit that he is not led too far away by plausible genealogies and native traditions, or by the similarity of Yusufzai names with those of Biblical places in Palestine. The Pushtu language, of which we hear a good deal throughout, contains, according to the latest authorities, at least six dialects. It is Aryan, and not Semitic; or, more properly, it occupies an intermediate position between the Indic and Iranic branches of the Aryan family. Whatever may be the result of our Afghan policy, it is to be hoped that ample encouragement will be held out to Indian staff officers to cultivate this language, and to pursue those investigations on which Dr. Bellew, in little more than one hundred pages, has thrown no inconsiderable light.

TWO VERSE-TRANSLATIONS OF THE ODYSSEY.*

TRANSLATIONS of the classics seem to be governed by a very subtle law of periodicity. Each year, we imagine, sees about an equal number of them produced; but the particular classic in favour differs at different times in a curious manner. The late Lord Derby's was only one of many renderings of the Iliad that appeared about fifteen years back, four years ago every one was doing Pindar, a year later there was a run upon the *Agamemnon*. Just now it is the Odyssey that attracts translators. The version of Messrs. Butcher and Lang, which has now established itself as a prose classic, has been followed by two translations in verse, both of them very noticeable, and one of them, as we shall hope to show, the work of a poet or poetess (for "Avia" is a very disguising pseudonym) of no mean merit. We had till now thought Mr. Worsley's Odyssey in the Spenserian stanza as satisfactory a version as was possible, but "Avia" has shown cause why we should reconsider that judgment. Whoever "Avia" may be, and whatever may be the Lucretian or non-Lucretian allusion veiled under her name (for we venture to translate the adjective as a feminine), her version has given us, and we trust it will give many readers, real and genuine pleasure.

Each new translation of the Iliad or the Odyssey serves to raise again the questions raised twenty years ago by Mr. Arnold in his *Lectures on Translating Homer*, and chiefly the question of metre. What metre is best suited for rendering in English the rapidity, the simplicity of thought and of expression, and the nobility of Homer? No one is likely to venture again on the couplet, after Pope has shown us in his Iliad, and Chapman in his Odyssey, such perfect models of all that Homer is not.

> The conscious swains, rejoicing in the sight,
> Eye the blue vault and bless the useful light—

is this, or are these verses of Chapman's furthest from Homer?

> With what clouds Jove heaven's heightened forehead binds!
> How tyrannize the wraths of all the winds!
> How all the tops he bottoms with the deeps,
> And in the bottoms all the tops he steeps!

Neither Pope's artificiality, nor Chapman's fancifulness, is likely to be imitated by any future translator; and the couplet from which one or the other seems inseparable is consequently condemned. Blank verse, again, has not as yet succeeded much better; for no translator who has used it has steered safe between an un-Homeric involution of style and bald dulness. It is hard to find fault with Cowper for translating Homer, seeing that the work was, while it lasted, a true *medicina mentis* to him, and kept him employed at a time when original writing was out of the question; but, though

* *The Odyssey of Homer.* Books I.–XII. Translated into English Verse, with Notes and Parallel Passages, by Sir Charles Du Cane, K.C.M.G. Edinburgh and London: William Blackwood & Sons. 1880.

The Odyssey of Homer. Done into English Verse. By Avia. London: C. Kegan Paul & Co. 1880.

Cowper's version sprang from a sound root—dissatisfaction with Pope—he cannot be said to have given us an Iliad or an Odyssey that is much more like Homer than Pope's versions are. Literalness, no doubt, there is in Cowper, and in his modern successor, Lord Derby; but there is an utter want of the Homeric flow, the Homeric directness, the Homeric simplicity and speed. Cowper is well aware—his own poetic experience has taught him—how difficult it is for the blank-verse writer to keep clear of prose in treating prosaic incidents, of which so much of a narrative poem must inevitably be composed; and he keeps clear of it by making use of a style that may be called debased Miltonese:—

> So saying, he issued his command; whom quick
> His grooms obey'd. They in the court prepared
> The sumpter-carriage, and adjoin'd the mules—

that is how we are led up to Nausicaa's journey to the river:—

> Ulysses with delight that song, and all
> The maritime Phæacian concourse heard—

that is how we are told of the reception of Demodocus's minstrelsy:—

> When thus he had perform'd
> His wonted task, two seizing, as before,
> He slew them for his next obscene regale.

that is how Cowper renders for us the deed of the Cyclops, told by Homer in two swift lines, without a pause or an unusual word:—

> αὐτὰρ ἐπεὶ δὴ σπεῦσε πονησάμενος τὰ ἃ ἔργα,
> σὺν δ' ὅγε δὴ αὖτε δύω μάρψας ὡπλίσσατο δεῖπνον.

Clearly Mr. Arnold was right when he condemned Cowper's blank verse as a means of representing Homer. It is neither simple enough nor rapid enough.

Mr. Worsley's well-known version in the Spenserian stanza is a charming poem; it is scholarly, accurate, melodious; it has many of the necessary qualities of Homeric translation. But it is in stanzas, and we are not sure whether that is not a fatal objection. If the couplet of Pope is impossible because of its inevitable tendency to epigram, to bring the thought round with a jerk, as it were, for the rhyme's sake, it may be said that the nine-lined stanza labours under a like difficulty. The stanza, like the long prose period, is necessarily self-contained; its complex structure gives it a completeness of its own. There is no guarantee that the breaks of the stanzas will coincide, or nearly coincide, with the breaks of the continuous hexameters, so that even a hand as skilful as Mr. Worsley's will often find itself unable to proceed without either expanding the sense unduly or allowing a break where it ought not to be. It may have been some consideration of this kind that directed both the translators we have now under notice to the long-lined rhyming metres which they have chosen. Sir Charles Du Cane has taken the fourteen-syllabled metre of Chapman's Iliad; Avia has taken a metre which is almost identical with that of Mr. Morris's *Story of Sigurd*. Both these modes have certain obvious advantages. Like Mr. Arnold's favourite hexameters, each of their lines is long enough to contain the equivalent of a line of the Greek, so that the translator is under no temptation to expand or retrench. Thus one of these versions renders the 331 lines of the Sixth Book in 327, and the other in 334 lines. Again, these metres bring no inducement either to epigram, like the heroic couplet, or to involution, like blank verse, or to any alteration of the Homeric pauses, like the Spenserian stanza. But between the two metres there is, except for this negative agreement, a considerable difference. Sir C. Du Cane's is an accurate and faithful version of the Greek, but the jog of the iambics is apt to fatigue the ear. Let us take some parallel renderings of well-known passages, beginning with the version of Cowper as an example of a style quite different from that of the two versions under immediate consideration. Here is the passage in which Proteus describes the fate of Ajax, son of Oileus (Book IV. 499-511):—

COWPER.

> Ajax, surrounded by his galleys, died.
> Him Neptune, first, against the bulky rocks
> The Gyræ drove, but saved him from the Deep;
> Nor had he perish'd, hated as he was
> By Pallas, but for his own impious boast
> In frenzy utter'd, that he would escape
> The billows, even in the God's despight.
> Neptune, that speech vain-glorious hearing, grasp'd
> His trident, and the huge Gyræan rock
> Smiting indignant, dash'd it half away.
> Part stood, and part, on which the boaster sat
> When, first, the brainsick fury seiz'd him, fell
> Bearing him with it down into the gulfs
> Of Ocean, where he drank the brine, and died.

SIR C. DU CANE.

> Ajax on board his long-oared ships was smitten on the wave:
> Poseidon first to Gyara's rock the mighty chieftain drave,
> And, rescued from the billowy surge, he would have 'scaped his fate,
> Though by Athene's wrath pursued with unrelenting hate.
> Had he not made an impious boast, mad with besotted pride,
> That in the god's despite the sea's great gulf he had defied.
> But straightway to Poseidon's ear his vaunting cry did go,
> And with his trident firmly grasped the sea-god struck a blow.
> Full upon Gyara's rock it fell, and sundered it in twain,—
> One fragment stood, whilst thund'ring fell the other in the main,
> Seated on which great Ajax spake the boast that brought him bane,
> For him it bore away, and plunged into the surging tide,—
> So, swallowing down a briny draught, the boastful hero died.

AVIA.

> With his long-oared galleys was Ajax wrecked in the breaker-swirl;
> For against the Gyræan rocks did Poseidon the black ship hurl;
> But the God saved him from the sea, from the threshold of Hades' gate;
> And now had he 'scaped destruction for all Athenê's hate,
> But for his own presumption, the word that in madness he cried,
> How that even in the God's despite he had 'scaped from the deep sea-tide.
> But Poseidon heard the vaunts that on high to the heavens he flung,
> And straight in his mighty hands his three-forked mace he swung,
> And he smote the Gyræan rock, and the crag in sunder he clave,
> And the half abode in his place, and the half plunged down to the wave,
> Even that whereon Ajax had sat in his folly and frenzy of soul,
> And it whelmed him down welter of surges and fathomless-deep sea-roll.
> So he died, when the vaunt-filled mouth had been filled with a draught from the sea.

The chief fault we have to find with these last lines, of which the ring is unmistakable, is that the translator has added to her original. "In the breaker-swirl," "the black ship," "from the threshold of Hades' gate," are interpolations; and "the vaunts that on high to the heavens he flung" is a very free rendering of μεγάλ' αὐδήσαντος. Elsewhere, as in the following passage, the pathetic lament of the ghost of Anticleia, the hero's mother, there is less of this license:—

> So did I speak, and my reverend mother forthright replied:
> "Nay, but still with a patient spirit thy wife doth abide
> In thy halls, and evermore, for the burden of sorrow she bears,
> Her days are consumed with heaviness, yea, and her nights with tears.
> But thy fair honour hath no man hitherto taken, but yet
> Telemachus holdeth in peace thy domain, and on high is he set
> In the feasts, where it fits that a ruler of men sit princes beside,
> For of all is he bidden: but ever thy sire in the field doth abide.
> Alone, for down to the city he never doth come, and his bed
> Is not with mantles and shining rugs full softly spread;
> But in winter he layeth him down in the house beside the fire
> In the ashes, amid the thralls, apparelled in evil attire.
> But as soon as the summer is come with a glory of golden sheaves,
> Low on the ground he lieth amidst of the fallen leaves,
> Anywhere under the naked sky in the vineyard-close;
> There doth he lie in his anguish of heart, and his grief ever grows
> With longing for thee, and now is he come unto joyless eld.
> For this cause also I died, when the day of my doom I beheld.
> For not in my halls did far-seeing Artemis come with her bow,
> And softly chill me to death with arrows like falling snow:
> No sickness it was that came upon me to steal away
> The life from the tortured limbs by the wasting of long decay.
> Ah, no, my beloved, my son! 'twas the aching of yearning for thee,
> For thy counsels and sweet lovingkindness, that broke the heart of me!"

In both these passages the metre is exactly that of *Sigurd*; but through half or more of the book the effect is varied by a rhyme in the middle of the line. Take, for example, this extremely vivid rendering of the passage, in the midst of the slaughter of the suitors, where Athene looks down from the rafters of the hall:—

> Then, then from the rafters' height did Pallas Athenê shake
> Her ægis, and thrilled with affright did the souls of the suitors quake.
> And this way and that from the king they fled, as the cattle flee
> When the hovering gad-fly's sting is driving them over the lea,
> When the long days come with the Springtide up from the southland sea.
> But the king and his folk, as the bow-beaked, crook-taloned vultures swoop
> From the crags on the mountain's brow, on the harmless fowl to stoop,
> Which afar from the clouds low-cowering scurry along the ground,
> But from down-rushing wing and devouring beak no rescue is found,
> Neither any escape; and with glee are the field-carles watching the chase,
> So smite they the suitors that flee through the murder-ravening place.
> And rang through the slaughter the shriek and the ghastly moan evermore,
> As they hacked at their heads, and the reek of their blood steamed up from the floor.

We have mentioned one fault in Avia's version, her tendency to interpolate. No doubt this is less of a fault in translating Homer than in translating any other poet, for the simple reason that Homer deals so largely in ornamental or conventional epithets and expletives that a translator is but carrying the Homeric practice a little further in doing the same. Another quality of her verse is more all-pervading and fundamental, and the favour shown to her version will exactly depend on how far readers are prepared to regard it as a good quality, a legitimate feature. This is, it need hardly be said, the quasi-archaic character of much of the language. In *Sigurd* it was essential to the poem; it was a part of its atmosphere. Is it so in the Odyssey? This is a very difficult question, and one that we are hardly prepared to discuss in a single paragraph. Perhaps the true thing to say is that archaisms of language are like most other features of an author's style; their effect depends on how they are managed. In Mr. Newman's Iliad they were ill-managed; in Avia's Odyssey we think them in the main happy and striking. Probably, as we have hinted before, this translation would never have been written if *Sigurd* had not been written first; but that is no dispraise of Avia's work. On the contrary, it is much to the credit of her judgment that she recognized not only the beauty of that great poem but its affinity to the Homeric epic. The result is that she has produced a version of the Odyssey in English which, if not perfect, is original and brilliant.

CHRISTIAN ART IN THE CATACOMBS.*

TWO years ago we noticed the First Part of Messrs. Northcote and Brownlow's careful revision of their standard work

* *Roma Sotterranea; or, an Account of the Roman Catacombs, especially of the Cemetery of St. Callixtus, compiled from the Works of Commendatore De Rossi.* New Edition, rewritten and greatly enlarged, by Rev. J. Spencer Northcote, D.D., and Rev. W. R. Brownlow, M.A. Part Second—Christian Art. London: Longmans & Co. 1879.

on the Roman Catacombs. After a long interval, the Second Part, devoted chiefly to the examination of the earliest Christian art, both in painting and sculpture, has made its appearance, and we proceed to bring it to the attention of our readers. There can be no doubt of the very great benefit conferred on all English students of Christian archæology by this careful compilation from the somewhat unwieldy and inaccessible works of the Commendatore De Rossi. The two Roman Catholic clergymen whom we have to thank for this useful labour have entered thoroughly into the subject, and in the Second Part, now under notice, have certainly improved on De Rossi's third volume. They claim the credit of having for the first time arranged in a chronological order all the paintings and the sculptured sarcophagi yet discovered in the Catacombs. This has never been attempted before. At first the explorers or describers of the vast ramifications of the cemetery of Callixtus, or of the more recently discovered one of Generosa, on the site of the Sacred Wood of the Fratres Arvales, merely accumulated materials for future arrangement, and the dates which they assigned to particular works of art were very often hastily assumed. Even Padre Marchi, to whose mantle the Commendatore De Rossi, as the official custodian of the Roman Catacombs, has succeeded, is by no means a safe guide in this branch of the subject. So much more is now known about the matter that the successive dates of the original excavation of the several galleries, chambers, planes, and levels have been satisfactorily ascertained. And a multitude of subsidiary arguments, derived from historical records and from the comparison of inscriptions and of other details, such as technical execution, confirms the general accuracy of these conclusions.

No one can examine the art of the Catacombs without seeing that the primitive Christians, brought up, as they necessarily must have been, in the traditions of their time, preserved the general system of debased classical decoration which they found in being. They rejected, of course, many heathen figures and subjects, while they adopted a few which suited their own purpose. Occasionally, for instance, they preserved Pagan types and mythological legends, such as the figures of Orpheus or Psyche, and symbolical representations of natural phenomena, such as Oceanus and Iris. But they began from the very first, though timidly and tentatively, to develop a Christian system of iconography. Their first attempts were naturally symbolical. They would have shrunk, especially during the ages of persecution, from the open representation of distinctively Christian subjects. Accordingly, such emblems as the Anchor, the Lamb, the Dove, the Fish, the Stag, the Dolphin, the Vine, and the Ship, were the most favourite adornments of the earliest Christian *arcosolia*. De Rossi and his English followers find the most ancient known specimen of Christian decorative painting in the gallery at the entrance of the cemetery of Domitilla, on the Via Ardeatina. Here the vaulting is covered with most gracefully flowing vine-branches, with birds picking at the grapes and naked boys gathering them. The fair presumption is that this painting, considering how significant an emblem the vine is, may be reckoned as a Christian work of an age which cannot be later than the second century. In the same cemetery there are subjects of a man fishing, of sheep feeding, of Noah in his ark, and of Daniel in the den of lions. Mommsen's authority is quoted for the opinion that these decorative works are of the same age as the original excavation of the particular part of the catacombs in which they are found. Another painting, representing two persons seated at a table on which are some cakes of bread and a fish, undoubtedly, in the eyes of Christian iconographers, represents, in a way which would veil its meaning from a heathen, the Eucharistic feast. De Rossi distinguishes between representations of the common feast, or *agape*, or rather the heavenly banquet; the supper of the Seven Disciples (recorded in St. John xxi.); and a purely symbolical exhibition of the fish with loaves of bread, meaning the sacrament of the altar. Mr. J. H. Parker, who is the *bête noire* of Dr. Northcote and Mr. Brownlow, wishes to get rid of the Christian character of such representations by describing them as merely depicting the anniversary commemorative feasts of the dead common among the ancient Romans. But Bishop Graves, of Limerick, admits, as any dispassionate observer cannot help doing, their religious character and intention. The so-called crypts of Lucina are another division of the most ancient part of the Cemetery of Callixtus. Here, in one of the cubicula, is a picture of our Lord's baptism. Here, too, the figure of the *Orante*, a female figure with the arms uplifted and outstretched in prayer, makes its first appearance. This, whether representing a particular Christian soul, or the collective Church, is one of the most common adornments of the catacombs. We can see no proof that the *Orante* ever stands for the Blessed Virgin. Even if it did, as our authors laboriously contend, the attitude and sentiment would imply a very different regard for our Lord's mother than is inculcated in modern Romanism. The first appearance in art of the Blessed Virgin with the Holy Child is found in the Cemetery of Priscilla, which is believed to be of the age of the Flavii, that is before A.D. 150, or of the time of Trajan, immediately following. This is naturalistic in character, and a very beautiful work of art, of excellent style and execution. The Good Shepherd, our Lord with the Woman of Samaria at the well, the Hæmorrhoissa, Jonah, Moses striking the rock, all make their appearance in the second century. The following age introduces a development and combination of subjects and compositions. The history of Jonah in its several stages, the sacrifice of Isaac, the healing of the paralytic man, now occur as common subjects. The chapel of Dionysas, about the year 275, has her figure with two other women and two men, all inscribed with their names, represented as standing in prayer in a paradise, wherein are birds and flowers. Nothing can be pleasanter or more instructive than to peruse our authors' pages, with their copious illustrations, describing in chronological succession these monuments of the earliest Christian art. The adoration of the Magi, and the story of Susanna (represented as a lamb, with the name *Susanna*, standing between two wolves, inscribed *Seniores*), are also subjects which were represented in the third century.

The catacomb paintings of the fourth century are certainly inferior in interest, as well as in artistic merit, to those of the preceding ages of persecution. The subjects, not much more varied than before, were treated less symbolically, but with growing debasement of style and method as compared with the ancient classical types. We still find the Good Shepherd a very favourite subject. Equally common is the Striking of the rock; and our authors strive hard to establish that in these pictures Moses and Peter are somehow combined in one person. It is curious to find a grievous complaint of the badness of the plaster used in the latter half of the fourth century, in the "Liberian area" of the Catacombs of Callixtus in particular. Owing to this many of these paintings have perished. It is in this part of the cemetery and at this age that the monogram of our Lord's name is first observed. The different forms of it are well illustrated by our authors. The nimbus also makes its first appearance in this place and at this date. The disquisition on the nimbus is one of the best in the volume before us.

Few specimens of pictorial art of the fifth or following centuries are to be found in the Roman catacombs. In these Christian symbolism has well-nigh disappeared. The whole style is "positive" and naturalistic. But the examples here given, some saintly figures from the crypt of St. Cecilia and a group from the cemetery of Generosa—the latter of the seventh century—are full of interest. Two fine effigies of St. Sixtus and another bishop, supposed to belong to the ninth century, the whole group having a text of Scripture surrounding it (this being the earliest known example of this practice), are here figured from the tomb of Cornelius; as is also a full-faced portrait of our Lord, from the catacomb of Pontianus, ascribed to the same ninth century, which has the earliest known example of an inscription commemorating the donor. The words of the legend are:—"De donis Dei Gaudiosus fecit."

In connexion with such votive inscriptions it may be well to add that the letters P.G.R.F.C., which are found in some paintings of the subterranean church of San Clemente, are satisfactorily explained as standing for the words "Pro gratia recepta fieri curavi." This may give a useful hint to the writers of inscriptions of thank-offering among ourselves.

We have further to notice a very interesting discussion of the traditional portraiture of our Lord. Our authors place side by side Kugler's engraving of the earliest known portrait of our Saviour from a ceiling in the Catacomb of Domitilla, now nearly effaced, and the late Mr. Heaphy's copy of the same original, which is (we learn) to be published in a forthcoming posthumous work on "The Antiquity of the Likeness of our Blessed Lord." We can truly say that we hope most earnestly that Mr. Heaphy's presentment, picturesque and pathetic as it is, is the more faithful reproduction of the original.

A further chapter describes the few remains of Christian sculpture, chiefly bas-reliefs from sarcophagi, which the Catacombs have afforded. There is not much to be said about them. For the art is but poor, and the subjects have no novelty; except that, among Pagan scenes admitted into the Christian circle, occurs Ulysses with the Sirens. The noble sitting figure of St. Hippolytus of Ostia, now in the Lateran Museum, concludes the series, and might have been more warmly commended.

In former notices of De Rossi's original work we have already called attention to his interesting discoveries of trinkets, tesseræ, gilded glasses, lamps, phials, &c., in the various Catacombs under his official care. Dr. Northcote and Mr. Brownlow reproduce these chapters without throwing any further light on the subject. But they give some new and interesting particulars, in an appendix, in illustration of the famous *Graffito* (supposed to date from the early part of the third century), found, some thirty years ago, in one of the recently excavated chambers of the Palace of the Cæsars on the Palatine. This, as is well known, represents a man worshipping a crucified ass-headed figure; and there is a roughly scrawled inscription—ΑΛΕΞΑΜΕΝΟΣ CΕΒΕΤΕ (for ΣΕΒΕΤΑΙ) ΘΕΟΝ. Tertullian refers to the blasphemous calumny, which was current among the heathen in his time in Rome and in Africa, that the Christians "adored the head of an ass"; and speaks of a painting exhibited at Carthage which represented a figure with the ears of an ass and a hoof on one foot, dressed in a toga and carrying a book inscribed with the words, "Deus Christianorum, ΟΝΟΚΟΙΗΤΗΣ, auribus asininis et pede." This was in the first years of the third century, at the beginning of the persecution under Septimius Severus. The stupid fable soon died out, and the last notice of it is to be found in Minucius Felix (Octavius c. 28):—"Audiro te dicis caput asini rem nobis esse divinam." But De Rossi thinks with great probability, that the Roman *graffito*, scratched by a schoolboy or a soldier (it is not known whether the apartment in which it was found was a school-room or a guard-room), refers to this fable. Liddell and Scott translate the word *ὀνοκοιτης* as "lying in an ass's stall." This may have some reference to the historical fact of the divine birth in the stable at Bethlehem. But there are other interpretations of the word. Our authors adduce for comparison

an engraving of an ancient gem, first engraved by Stephanoni in 1646, which represents an ass clothed in a toga teaching two disciples. For this they are indebted to Dr. Kraus's *Das Spottcrucifix vom Palatin und ein neuentdecktes Graffito*, 1872. Dr. Kraus also compares a medal of Alexander the Great, the reverse of which shows an ass suckling its foal, with the inscription round it DN IHS XPS DEI FILIUS. This is certainly a very curious and interesting discussion. We wonder that our authors have not referred to the description and engraving of the strange *graffito* of a lamp on the tomb of the Virgin Januaria, which De Rossi gives in No. 22 of Tavola xxviii. of the Atlas of his last volume. This lamp is in the not unusual form of a Roman galley; but on the curved extremity of the prow of the galley is transfixed a monstrous human face with the ears of an ass. De Rossi's explanation—a rather far-fetched one—is that this symbol represents the transfixion of the stupid fable of the ass by the cross. This new English edition of the *Roma Sotterranea*, which is now completed, is a real boon to all students of ancient Christian art.

CHARLIE.*

THE autobiographic hero of *Charlie* tells us, on nearly the last page of his third volume, that "I could enlarge." There is, however, one peculiarity of Mrs. Woodward's work which we defy her or her spokesman to enlarge, and that is the length of her sentences. These remarkable creations are of such dimensions that words or lines are hopeless as units of measurement, and the only standard at all convenient is that of the inch. The second sentence of the first chapter is a five-inch-and-a-half one, filling a page, and handsomely turning the corner of the page before and the page after. Three-inchers and four-inchers abound; and, when we come to p. 81, we find what turnip-growers would probably call a great mammoth champion sentence, which occupies a page and a half, or a good eight inches of print. We forget at this moment the precise length of the famous congeries of words in the *Kritik der reinen Vernunft*, which is supposed to have put Kant at the head of the framers of big things in sentences. But, if Mrs. Woodward has not beaten the philosopher, she has certainly in this surprising instance run a good second. Nor is the construction of these fabrics less remarkable than their bulk. The author, to do her justice, does not often lose the grammatical thread of connexion, nor does she, like Clarendon—her only English rival—expand the unhappy phrase with parentheses and asides. She rather seems to have an objection to the use of stops, and to consider that conjunctions are much better. Thus the reader is carried along sweetly by "ands" and "thoughs" and "whiles" until he finds himself at the end several miles rather than inches from the sense of the beginning. Here is a specimen five-incher, which ought to prove of great use to all examiners, schoolmasters, parish clergymen, and aspirants to the proud position of a sub-editor of periodicals:—

> My own character too had probably developed much quicker than that of most boys of my age, and living in this close companionship with a man of such peculiarly grave and abstracted ideas—one, too, who never associated with his neighbours or condescended to evince even the faintest interest in the petty everyday trifles which were taking place around him, may have quickened my powers of discernment and made me more able to appreciate a character which, as it little by little unfolded before my dawning intellect, filled me with the deepest awe and veneration, and a kind of grateful idolatrous love with which no other mortal man has ever inspired me and never will now that the object of my first fresh boyish devotion is gone—a devotion which I honestly believe to have had the same strength and intensity as though I had been a full grown man, able to look at things from a man's standpoint, and bring the full weight of a strong and mature affection to bear upon the subject which he singles out as worthy of being enshrined in his heart's inner sanctuary—worthy of being loved first and foremost better than one's self, better even than one's life.

It will probably be perceived from this specimen's contents, as well as from its style, that the interest to be found in *Charlie* is of a placid and contemplative kind. It consists indeed rather in a mild curiosity to know how Mrs. Woodward will extricate herself from the ambages of these monstrous propositions, than in any particular desire to know what becomes of the characters or any particular sympathy with their occupations. They are, for the most part, a pleasant old-fashioned folk of the kind who never were much on any land or sea except in the realms of fiction. They cool their heated brows, they all but discover their long lost fathers by means of diamond rings, their lips curl, and their eyes flash quite in the approved style, and their sentiments when they are good are irreproachable, and when they are bad are bad and no mistake. The excellent Charlie, who tells his own story with a fine manly absence of bashfulness at the display of his own perfections, is a proper moral young man as you shall meet of a summer's day. At an early age he is chosen to be guide, philosopher, and friend to one of his "college" companions, and the fame of him is such that shortly afterwards, when he has got an open scholarship and is about to proceed to Oxford, a baronet offers him three hundred a year and unlimited travelling expenses to accompany his ne'er-do-well son, and keep him as far as possible out of mischief. The latter task even the irreproachable Charlie fails to accomplish, which, as he must have been about eighteen at the time of his assuming the office of Mentor, is perhaps not very wonderful. His position, too, seems to have been rather an awkward one, and perhaps one which a person who was provided plentifully with the finer feelings would have preferred not to hold. The exact nature of Mr. Stafford's delinquencies is veiled in several three- and four-inchers of the finest, but vaguest, periphrasis. But as the Mentor alludes to a "lonely Italian grave," to which, during their travels, his hopeful pupil, or companion, or whatever he is to be called, had consigned some apparently female person by "false promises, and neglected vows, and deliberate desertion," it may be suggested that a man of honour would have washed his hands of Mr. Stafford about the date of the digging of that grave. However, Charlie, to do him justice, has the finest moral sentiments at command on every occasion, and bestows quite three-hundred-a-year's worth of them on the impenitent Mr. Stafford. It is also to his credit that though the conduct which led to the Italian grave does not seem to have struck him in the light of a *vice rédhibitoire* as far as concerns his engagement with Mr. Stafford, he promptly takes the latter away under threat of revelations as to his wickedness when he finds him in the society of a beautiful girl who is his own special adoration. "How I hated seeing him hovering thus closely about the beautiful and guileless girl, whose hand he was no more worthy to touch than the loathsome reptile is fit to associate with the pure and harmless dove," says Charlie, with much frankness, but perhaps with a little severity, considering that, at this period, he has been eating the loathsome reptile's bread for some four or five years. Obviously, however, Charlie was a person upon whom the relation of keeper to a loathsome reptile did not weigh heavily. He talks loftily of the loathsome reptile's "contracted views," when that animal wished to "monopolize the society" of his paid companion, and is altogether a very superior person. Like all superior persons with a belief in themselves he prospers. His unknown parent or somebody else leaves him large sums of money, the loathsome reptile is converted by a fever in India, he is released from his guardianship with a handsome legacy from the paternal baronet, and lastly his chief patron, the father of the pure and harmless dove, proves himself to be the most amiable and accommodating of papas. Indeed, the scene in which the Gods provide goods for this model young man is almost humorous if only we could feel sure that the author sees the humour. Charlie has settled down in London lodgings, intending with his savings during his years of reptile-keeping to read for the Bar, and he is dreadfully alarmed at the designs of a match-making aunt of the pure and harmless dove—whose life, by the way, he Charlie has saved when she was a small girl. The father appears and flings his daughter at the head of the young man in a way only too uncommon with fathers of large property:—

> "What good?" retorted Mr. Vaughan, rising excitedly from his seat and beginning to pace the floor. "My dear Charlie," here he stood still and looked grimly down upon me, "if you will excuse my saying it, you are a fool."
>
> "It's not exactly an agreeable fact to be reminded of," I drily responded, "but I really begin to think I must be one, for I am certainly quite at a loss to understand your object in seeking to drag me into an affair of such extreme delicacy."
>
> "Never mind about that," quickly interrupted the impatient clergyman, "just answer me this one question, Do *you* not love my daughter?"
>
> "Pardon me," I said, looking at him proudly, for on this point I felt that I rather deserved credit than otherwise for the way in which I had acted towards him, "but may I inquire whether I have ever done or said anything?"
>
> "I don't want to discuss your sayings and doings, my dear fellow," energetically exclaimed Mr. Vaughan, "I only want a simple answer to my question."

It is odd that the excellent Mr. Vaughan, who had known Charlie all his life, should not have been aware that a simple answer was altogether out of the power of that magnificent gentleman to give. But if the impatient clergyman had strengthened his very sensible assertion, "You are a fool," by one of the customary expletives to that phrase, we do not think his bishop could have had the heart to find much fault with him.

By the aid of five-inch sentences and of an infinite ingenuity in not coming to the point, Mrs. Woodward has made out her three volumes. But we have not often read three volumes with less in them. Good instances of the author's inability to write plainly and naturally may be found in the chapters devoted to Charlie's life in "the Middlebury College," by which curious title the author seems to describe the grammar school of a cathedral town forty or fifty years ago. At that time there were not many schools save Eton and Winchester, to which the term college was applied at all, and certainly nobody thought of talking of "the" Eton College or "the" Winchester College. An institution, however, which contained such very curious *alumni* as the Middlebury College boys, is fairly entitled to a curious title. This is the way in which the Middleburian of that day turned his period and polished his phrase:—

> He talks of getting a scholarship for himself in precisely the same matter of fact terms, as I speak about sitting down to dinner, while as for exhibitions and things of that kind he seems to think he has nothing to do but simply to put out his hand and graciously take them. If, therefore, he holds these exalted views on his own account, there is no knowing what kind of views he may entertain with regard to my individual self. He may insist perhaps, for anything I can tell to the contrary, on seeing me formally installed as Lord Chancellor, or some equally dignified position, before he has done with me.

It is interesting to pause for a moment, and to think what would have been the actual fate of a youth who should have made this speech at a public school forty years ago. It can be imagined, but perhaps must not in these squeamish days be described.

On the whole we cannot say that it would grieve us if we never

* *Charlie.* By Mrs. Woodward. 3 vols. London: S. Tinsley & Co. 1880.

read another novel of Mrs. Woodward's. Her oddities are but rarely amusing, and the non-amusing intervals are many, long, and frightfully barren. It is faintly pleasant to find that there is a person who thinks *rapprochement* is a synonym for *rapport*, and that a *spiritual* countenance is one which shows a pale and interesting melancholy. A hero who takes the pains to explain, when mentioning the wicked implement called a latch-key, that he had not asked for it, but had received it, an unsought gift, from his landlady, may also raise a smile. "Rose-coloured visions of future laurels to be won" is a not uncheerful confusion of *Laurus nobilis* with *Nerium oleander*. Among some very curious epigraphs with which Mrs. Woodward has headed her chapters, it is pleasant to meet with a poem beginning "Thou faileth not!" which is perhaps the nicest false concord imagined by a bard since Mrs. Rosa Fitzroy Tymmyns wrote about "Thine eye which gleameat." But these things are not too numerous, and the rest is mostly null and void. When Charlie informs us that "I put my arm round her with an almost reverential tenderness of manner, and kissed her sweet tremulous lips," the information is most welcome, not indeed because of its intrinsic interest, nor because of the language in which it is given, but simply because it heralds "the end," which duly appears thirty pages or so later, and dismisses the weary critic.

KLEIN'S STUDENTS' MANUAL.*

DR. KLEIN tells us that the present work "is the product of a long and successful experience in training candidates for the Civil Service, the Legal, University, and other Examinations." It may therefore, he continues, "reasonably be hoped that Students will find it a useful handbook in their studies." Further, that the student may have an idea of what he will have to encounter, "copious specimens of Papers set at previous examinations have been added." Altogether it seems that we may accept this book as good evidence of the kind and quality of knowledge required from candidates for "the Indian and Home Civil Service, the University, Law, and other Examinations," for which the work on its title-page proclaims itself to be "especially adapted."

Far be it from us to pronounce whether the student will or will not find this a useful handbook. A useful handbook, as we conceive, is that which pulls the candidate through; and Dr. Klein, by his own account, must know how this is to be done. As the proof of the pudding is in the eating, so the proof of the scholar is in the passing. The anxious parents of "seven fair sons"—to speak in the conventional phrases of romance—when they send them out to encounter the giants and dragons, in the modern form of examiners, that bar the road to fame and fortune, or even to the modest maintenance of a Government clerk, ask for no better evidence than this of the goodness of the education for which they have paid the bills. If Dr. Klein's pupils pass, doubtless the benedictions of many a toiling father and harassed mother are showered upon his head, and more precious will his handbook be unto them than all the works of Gibbon, Macaulay, Freeman, and Stubbs put together.

Speaking, however, as an unpractical critic, we should say that in itself this is by no means a good book. We will not say that it is altogether and wholly bad; in this age of enlightenment it becomes every day harder to attain unto the perfection of badness. Dr. Klein has—if we may venture slightly to alter a line from the *Northern Farmer*—"read whot a owt to 'a read"—to wit, Hallam, Macaulay, Freeman, and Stubbs; at least he quotes from them. But the book from first to last shows signs of careless and hasty workmanship; it is badly worded, badly compiled, inaccurately printed; the English is often so strange that in spite of the author's assertions of nationality by speaking of "our own Royal family," "our own poet Tennyson," "our constitution," we suspect that the language is to him a foreign one; and from time to time he betrays that he has but imperfectly understood the events he narrates. The chief praise we can give is that as far as we have tested them, his dates are right. But he seems not to have extended his care to proper names, though as to these some of the peculiarities of his spelling may, we admit, be due to theories of his own. He may have his reasons for writing *Cirdic* and *Pinda*, instead of *Cerdic* and *Penda*, and for presenting Ælfred's daughter, familiar to us either as Æthelflæd or Ethelfleda, under the form of *Alfreada*, though surely in a handbook it would be better to follow the usages of our best modern historians. At any rate he should have been more consistent than to write Athel*stone* all through p. 18, and Athel*stan* at p. 33. "Edmond" and "Edmondsbury" for Edmund and Edmundsbury, and *Sight*bert for Sigeberht, are irritating eccentricities. The youngest son of Edward III., Thomas Duke of Gloucester, appears as "Richard Duke of Gloucester"; and Napoleon's second wife is called "the Archduchess Maria *Theresa*." Then we have "the Gallic *law*," where evidently the Salic Law is meant; "Theodore, a monk from *Sarsus*," for Tarsus, "Beda, of *Yarrow*," instead of Jarrow. Still more unpardonable is the following slip in the account of John's reign:—"In his [John's] absence, the Nobles had been considering the question of redress of grievances. Lanfranc had shown them a copy of the Charter of Henry I., and upon this they based their claims." Langton of course is meant; and the student who thinks for himself may possibly see this; but if he is to go to the trouble of "thinking for himself at all," he may as well get up some good authority at once. The student who does not think will accept the statement with perfect calm—one "old bloke" of an archbishop, to express ourselves after the manner of ingenuous youth, is as good as another; but then how will it fare with him if his examiner should happen to know better? There is another pitfall at page 4, where we read—

> In the year 43 A.D. Claudius, a Roman General, made a more serious attempt to conquer the island.

Imperator no doubt is a military title which may be rendered as *general*, and therefore it is possible that "Claudius, a Roman General," may be a super-accurate way of describing Claudius the Roman Emperor. But one is tempted to suspect *Claudius* to be a misprint for *Plautius*, whom the Emperor sent to prepare his way in Britain by a preliminary campaign.

From "The Roman Period" we pass on to the "Saxon Period." Though it is sad to reflect that future Civil servants are being taught to talk about "Saxon" periods, otherwise the account of "the institutions of the Saxon tribes" is not so bad. But Dr. Klein's views about the Bretwalda are hard to make out:—

> There was a sort of loose relationship among the Bretwaldas of the different Kingdoms, but it was little more than that they acknowledged one ruler to be more powerful than the others, and furnished him with troops.

The reader may be pardoned if he infers from this that all the Heptarchical kings were Bretwaldas together. If learners are to be bothered with the Bretwalda, it should be made clear to them that, as in the case of the Phœnix, there was but one at a time. The definition given in the glossary at the end of the book, "Chief of the state in Saxon times," is inadequate and vague. The account of Æthelstan's exploits is also not as intelligible as one would wish:—

> Early in his reign he quarrelled with the Danish King of Northumbria, whose throne was imperilled by internal disturbances, A.D. 937, and Athelstone defeated them [*sic*] at the great battle of Brunanburg.

Passing on to the time of the Confessor, we come to the fray between the burghers of Dover and "Eustace, Count of Bologna," in which Italianized form the pupil will hardly recognize the familiar Boulogne across the Channel. Although Godwine, in refusing to punish the townsmen, "was in the right, his unpopularity was so great that he had to fly to the north, where he endeavoured to raise some forces which soon deserted him." In reality, the forces raised by Godwine were drawn, as might be expected, from his own and his sons' earldoms—Wessex, East Anglia, and part of Mercia; and their gathering-place was no further north than Beverstone, or, as the Worcester Chronicler says, Langtree, in Gloucestershire. The third chapter and the earlier part of the fourth, which treat of "Saxon Institutions" and of the reign of the Conqueror, are, on the whole, decidedly superior to what has preceded them; but we should like to have a reference to the following quotation:—

> Freeman says, "the Witan was originally of freemen in their entirety, but gradually ceased to be so, on account of their very impossibility of attendance."

Till the original passage is pointed out to us we shall refuse to believe that Mr. Freeman ever turned out a sentence so queerly expressed, or that he made *Witan* (= *Sapientes*) a singular, though Dr. Klein not infrequently does so. King Stephen's elder brother appears under the strange style of "Theobald, Earl of Mortmain." *Mortain*, we presume, is meant; but it was Stephen himself who, by the bounty of his uncle King Henry I., was Count of Mortain. Next comes Henry II., who "married Eleanor of Acquitaine, and thus added the Isle of France to his dominions." Now Henry did acquire a good deal of territory by his marriage—"he took her to wife, and all Poitou with her," as the Peterborough Chronicler expressively says; but how he, or she either, came by the district known as the Isle of France, a part of the immediate domain of the King of the French, is beyond us. We are the more puzzled by reading, three lines lower down:—"For his French dominions he [Henry II.] was vassal of the King of Paris, but there was a great inequality of strength, as the only one left was the Isle of France." This we give up in despair. But something more astounding follows:—

> A great mistake was made by the King, in having his son Henry crowned as King of England by the Archbishop of York, as it was putting power in the hands of a very untrustworthy man. The reason of Henry's conduct in this matter was his continued absence in his French dominions. The King of France was highly indignant that his daughter, who had married the Prince of Wales, was not crowned at the same time. This Prince was spoken of by the historians of that period as Henry III.; but of course was not so recognised by us.

As Henry, "the Younger King," was married to a daughter of Louis of France, the only interpretation we can put upon this passage is that at the time Dr. Klein wrote it he supposed "Prince of Wales" to be the proper style of an English King's eldest son in the twelfth century. The carelessness with which the book has been compiled is shown by the fact that some pages further on Dr. Klein rightly mentions Edward of Caernarvon as "the first styled Prince of Wales." The previous bearer of that title, Llywelyn, is in the same page elevated to the rank of "King of Wales." In John's reign the writer gets into confusion about the claim of Louis

* *The Students' Manual of the History, Laws, and Constitution of England. From the Roman Period to the Present Time. Especially adapted to the Indian and Home Civil Service, the University, Law, and other Examinations. With a Glossary of Constitutional Terms, and Questions set at Previous Examinations.* By Dr. J. Klein, M.A., Director of the Civil Service Institute. London: Civil Service Printing and Publishing Company, Limited, 8 Salisbury Court, Fleet Street, E.C. 1880.

of France to the English crown. It rested, he says, "only on the assumption that John had forfeited the crown as a murderer of his nephew, and that the Prince had married into the Royal Family of Brittany." If "the Prince" means Louis—and it is difficult to see whom else it can mean—it was into the royal family of Castile that he had married. His wife was the famous Blanche of Castile, daughter of Alfonso III. and niece of John of England. His claim in right of his wife involved the rejection of the apparently prior claim of the House—not a "Royal" one—of Brittany. Next we are puzzled by reading that "In 1305, Bruce, the grandson of the sole claimant of that reign, murdered his rival, Comyn." Why *sole* claimant? Referring to Lingard, we find that there were thirteen claimants of the Scottish kingdom, or at least of a share of it, and Dr. Klein has himself named the three—Balliol, Bruce, and Hastings—whose claims were worthy of serious consideration. At p. 77 in this same section we meet with the extraordinary statement that "it was not until the reign of Charles II. that the clergy taxed themselves separately in their own Houses of Convocation," the fact being that it was in Charles II.'s reign that they abandoned their ancient privilege of separate taxation. However, as at p. 188 Dr. Klein gives an account of Convocation which is quite inconsistent with his previous statement, the reader can take his choice. It is a minor matter that in the summary of the provisions of the Statute of Treasons, "*conspiring* the death of the King" ought to be *compassing*, a word of far wider import. Dr. Klein describes the statute as "limiting the cases of high treason . . . . to three definite heads." The three he specifies are those of historical importance; but seven kinds of treason are defined by the Statute.

In the York and Lancaster period the book takes a turn for the better; but in the reign of Henry VIII. the author begins to flounder. It is a trifle that he calls Charles V. by the inaccurate modern title of "Emperor of Germany," though we should have expected better things of any writer with a German name. Describing the fall of Wolsey, he says that "in the House of Commons sentence of forfeiture of goods and imprisonment was passed upon him, for violating the Statute of Præmunire." It was the Court of King's Bench, not the House of Commons, that gave the judgment of forfeiture. Further on we read that "Sir Thomas Cromwell (1540) and Sir Thomas More (1535) were both summarily condemned and executed." This coupling of More and Cromwell is quite in King Henry's own style of sending a Papist and a Protestant to execution on the same hurdle; but in fact More was not "summarily condemned," as was Cromwell, who fell by an Act of Attainder, without being heard in his own defence. More was indicted and tried before a jury. Passing on to Mary's reign, we read that, after Wyatt's rebellion,

> the Princess Elizabeth was also committed to the Tower, and every expedient was resorted to by the jealousy of the Queen to implicate her with the rebellion, but the judges acquitted her amidst the rejoicings of the nation.

The Lady Elizabeth, never having been brought to trial, could not, strictly speaking, be acquitted. A sentence in Mr. Froude's history, "The judges declared that against Elizabeth there was now no evidence," may perhaps have suggested the idea of an acquittal. The account of the proceedings against Strafford, though not absolutely inaccurate, altogether ignores the fact that, after fifteen days of trial, the impeachment was abandoned for a Bill of Attainder. Legal and parliamentary technicalities are evidently matters in which the writer is not at home:—"The trial of Queen Caroline," he says, "occurred in 1820, but is of no interest to the student of constitutional history, beyond the refusal to allow her name to appear in the Liturgy." The student of constitutional history ought to know that the proceedings popularly and inaccurately called "the Queen's trial," consisted in the consideration by the Lords of a Bill of Pains and Penalties—which the Government eventually dropped—and in the examination of witnesses in support or refutation of the charges on which the Bill was founded. On the whole, the most brilliant passage in the book is the really terse and vigorous account of the character and career of Robert Carr, Earl of Somerset:—"Being, however, an unprincipled man, he poisoned Sir Thomas Overbury in the Tower."

If the "Examination Papers," printed at the end, are accurately reproduced, there was once, presumably within recent times, an examiner who asked, "What do you know of the Saxon Prince Arthur?" Charity would hope that he wrote Alfred. Another somewhat incoherently demands, "What were the circumstances and in whose reign was John Hampden tried?" And the candidate who was asked, "What institutions have been attributed to Alfred?" might fairly object that he had come prepared to be examined as to facts, and not as to fiction. Judging by these specimens, it is possible that this manual may be good enough for its purpose.

FRANCIS DEÁK.*

IF this book were presented as a complete biography of Deák, it could hardly be considered adequate, for it tells us little of his ordinary life and nothing at all of his opinions on other than political subjects. As a political biography, however, it is almost perfect. The writer makes no display of learning; but he has studied all the best sources of information, at least in French and German, and he has wrought his materials into a clear, interesting, and instructive narrative. The period in which Deák lived offers so many opportunities for fine writing that in these days we cannot but be grateful to a biographer who has not apparently written a single line for the sake of mere effect. In some respects the book is almost as much a history as a biography, and the author has succeeded admirably in defining the manner in which Deák's influence modified the general tendencies of his time and was modified by them in turn. He does not make the mistake of supposing that his readers know all about the events which led to the establishment of the Dual system; on the other hand, he has avoided the still greater error of confusing them with masses of worthless detail.

The tone of the writer is from beginning to end that of a warm admirer of Deák; but no one who has given attention to the development of modern Hungary is likely to accuse him of exaggerating the good qualities of his hero. Deák was not a master of the brilliant rhetoric which for a brief period gave Kossuth so strong a hold over his countrymen; but brilliant rhetoric is, after all, a very ineffective instrument for the solution of complicated political problems. He had what was far more important—a keen appreciation of practical difficulties, and extraordinary tact and resource in overcoming them. No statesman of his time held more firmly by principles which he regarded as essential; but there was not a touch of pedantry in his mode of applying his favourite doctrines, and he never defended them in the dogmatic and intolerant spirit of modern Radicalism. Even for his bitterest opponents he had often a kindly word; he was willing to believe that like himself they aimed at promoting human happiness, and that they only differed from him as to the means by which the end was to be achieved. As a debater he was distinguished mainly by the sort of good sense which marks the best speeches of Sir Robert Peel. He was probably incapable of indulging in loftier flights than could be easily followed by men of average intelligence; but in any case the arguments he preferred were those that could be appreciated by plain people, and that bore directly on the subject he might happen to be discussing. His absolute sincerity gave warmth and glow to his style, and it was enlivened by a strong sense of humour and by a remarkable faculty of enforcing abstract truths by familiar illustration. A man of this stamp could not fail to become popular, and it is to his honour that he invariably exercised his influence for objects of enduring value, without favour to any particular party and without the faintest reference to his personal advantage.

Born in 1803, Deák began his public career in 1833, when he was elected by his native county a member of the Hungarian Diet. At that time the Austrian Empire was as much under the control of Prince Metternich as Germany is now under the control of Prince Bismarck; and the old Chancellor, who could not forget the experiences of his youth and middle age, lived in continual dread of revolution, and fancied that it might be prevented by a system of crushing despotism. Almost every kind of abuse flourished in Hungary, and the task of the Liberal party was to create a popular demand for reform as well as to attack the Vienna Government. Although only thirty years of age, Deák at once took rank as one of the Liberal leaders, and when the Diet closed in 1836 he was generally recognized as the most influential Hungarian politician of the day. In the Diet of 1839-40 he managed to effect a sort of reconciliation between the Government and the Opposition; but the Government had no real wish to be on good terms with men of Liberal opinions, and soon found means of recovering its independence. Deák and his friends were bold enough to think that nobles ought not to be excluded from taxation. This alarming suggestion was resented by the large class of peasant nobles, and the Government, by working on their fears and prejudices, easily succeeded in stirring up among them intense hostility to the reformers. Although elected to the Diet of 1843, Deák did not take his seat, and he was accused by a good many people of shrinking from the struggle in favour of general taxation. There is, however, no reason to doubt that his real intention, as he himself explained, was to discourage bribery and intimidation in popular elections. In direct opposition to his wishes, illegal means had been used to secure his return; and he had resolved that he would never represent a constituency unless appointed by its free choice. "He should always see blood-stains upon the mandate," he wrote to a friend; "and he should never venture in the Diet to give free expression to his feelings with respect to imposing some restraint upon electioneering abuses, because he should read in every face the reproach that he himself owed his return to the various arts of 'Korteskedés'"—"Korteskedés" standing for "the electioneering violence and corruption" which had been described as "a cancer at the very root of public life in Hungary." Ill health prevented him from at once entering the Diet of 1847; but when, in 1848, the revolutionary movement throughout Europe threatened to make its influence felt in Hungary, he could not resist the appeal to place his services at the disposal of his country. He was immediately invited to become a colleague of Kossuth in the Cabinet of Batthyány, and he accepted the office of Minister of Justice, for which he was best fitted by his training and sympathies. This was the only occasion on which he could ever be persuaded to assume an official position; but during his short term of power he made his mark as an administrator of a high class. It was a time when wild schemes were "in the air"; and the peasantry, in particular, hoped that they were about to see the end of all their troubles. Deák never

* *Francis Deák, Hungarian Statesman.* A Memoir. With a Preface by M. E. Grant Duff, M.P. London: Macmillan & Co. 1880.

gave more emphatic proof of the sterling character of his statesmanship than in the resistance which he offered to every proposal for undue extension of the functions of the Government. He frequently insisted that Parliament would not act in the interests of the poor "by ceasing to respect the rights of property," and that "the peasantry could become free and prosperous only through their own industry and energy, and not by receiving gifts." He had even the courage to set forth in one of his speeches the advantages of "the landlord and tenant system," and to warn the country—in terms which might be profitably studied by English Radicals of the present day—that industrial development would be impossible "if the proprietor were in constant alarm lest the Legislature should deprive him of the land he has let on lease." "For the improvement of trade," he added, "we are in need of much foreign money. Who will give credit on uncertain tenure?"

In the revolutionary period of 1848-49 the House of Hapsburg had a magnificent opportunity of permanently conciliating Hungary. The people were determined to secure their obvious rights; but, under the influence of Deák and other less prominent politicians who accepted his guidance, they had learned to moderate their claims and were prepared to advocate them in a peaceful temper. The Emperor Ferdinand and his successor, the present Emperor, were, however, directed by arbitrary and short-sighted counsellors, and sought rather to force a quarrel on Hungary than to deserve her good will. Deák took no part in the war of independence, and, as a matter of course, his motives were altogether misrepresented by the vehement party of action. The whole tone of his mind would have unfitted him for the position of a revolutionary chief, even if he had approved of Kossuth's aim; but he had hardly more sympathy with those who attempted to sever Hungary from Austria than with the adherents of centralization. Events have proved, and are proving every day, that he was right. If the Austrian Empire were broken up, Hungary could not hope, under the most favourable conditions, to play an important part in Europe. She can influence the course of Western progress only by forming an element in a great State over whose policy she has some control. The chances are, indeed, that she would be unable to maintain her position as an independent Power; for, were the Hapsburg dynasty destroyed, the Slavonic populations—except, perhaps, the Czechs, whom Germany would desire to absorb—would inevitably become subject to the Czar, and Russia would regard her work as incomplete if she did not annex Hungary also. This was clearly seen by Deák, who therefore never ceased to impress upon his countrymen the necessity of maintaining their connexion with Austria. Mere respect for ancient treaties might not have hindered him from associating himself with the movement for independence; but he was a statesman of too solid a type to allow his policy to be determined by fine sentiments rather than by an accurate appreciation of permanent national interests.

While, however, he would not support an attempt to make Hungary independent, he was equally resolved to do what he could to secure for her the right to manage in her own way what were strictly her own affairs. That it was the duty of the House of Hapsburg to grant her this right was his conviction from youth to old age, and he expressed his belief with as much firmness after the revolution was suppressed as he had manifested before revolution was thought of. The author of the present volume maintains again and again that Deák's strength lay in the fact that he invariably appealed to law, and it was no doubt an immense advantage that the claims of Hungary had been guaranteed by solemn engagements. At the same time, had these claims been in themselves unreasonable or inexpedient, the mere circumstance that they were in accordance with law would not have sufficed to decide the dispute. His position was impregnable, not because he cited definite documents, but because he was able to prove that the Hungarians could not be well governed except by rulers whom they themselves selected, and that their possession of a certain measure of independence, instead of weakening the Empire as a whole, would greatly increase its power. The process by which the Emperor, after years of evasion and delay, was at last compelled to settle the difficulty in the manner which commended itself to the judgment of Deák, is in its way as interesting as anything in recent history; and the story is told, not only accurately, but with vigour and animation, in this book. It was to the disasters of the Italian war that the Hungarians owed the first approach of the Imperial Government towards a compromise. Even these disasters, however, did not persuade the Emperor that important concessions on his part were absolutely essential. He was convinced only after the defeat of Königgrätz, and such were the prejudices which prevailed at his Court that it is doubtful whether a satisfactory settlement would then have been arrived at, had not his good intentions been supported by the mingled caution and firmness of Count Beust. That Hungary was willing to abate some part of her demands and to content herself with the Dual system was mainly due to the influence of Deák. He possessed the respect and confidence of all classes of the population, and when he assured them that under the proposed system they would obtain every right for which it was worth while to contend, they frankly accepted his view. It is not, therefore, too much to claim on his behalf that he was the main author of the existing constitution of the Austro-Hungarian monarchy. Other causes besides his activity must be taken into account; but without him these causes would have been inadequate to produce the result. The fact was universally recognized after his death, when on the one hand the Empress placed a wreath on his coffin, and on the other the people insisted on his being buried in earth brought from every county in Hungary.

The working of the Dual system has been attended by serious difficulties, but its effects have not, on the whole, fallen short of Deák's anticipations. It has given all sections of the Empire an opportunity of remedying in some degree the evils caused by a long course of misgovernment, and its tendency has been to discourage a hasty treatment of questions of foreign policy. The writer of this work is of opinion that, while the system is suitable to the Hungarians, it does less than justice to the other "nationalities" of the monarchy, and that Bohemia especially has serious grounds of complaint. It happens that at the present moment a powerful party even in "Court circles" at Vienna is saying much the same thing; but the most prudent Austrian statesmen do not favour proposals for further decentralization. Of all the Cisleithan provinces, Bohemia has the best claim to regulate its own business. Even Bohemia, however, does not make out a very good case; for more than a third of the population is composed of Germans, and if the country were made as independent as Hungary, the rights of the Germans would be absolutely at the mercy of their hostile Czech neighbours.

ROUND ABOUT A GREAT ESTATE.*

IT would be impossible for Mr. Jefferies to write anything about the country that is not more or less enjoyable and instructive; but even Mr. Jefferies's vein of knowledge may be exhausted with indefatigable use, and we are scarcely surprised that it shows signs of giving out. We remember with gratitude all we have learned from him in *The Gamekeeper at Home*, *Wild Life in a Southern County*, and subsequent volumes of almost identical character. But when we accompany him in his rounds on "the great estate" we feel that the lounging strolls become occasionally wearisome. We seem to recognize the descriptions of scenery, though they may be executed, as before, with the truth and the delicacy in which he stands unrivalled. He has already taught us to explore the roots of the hedgerows, and has almost exhausted the wild flowers that succeed each other in their seasons. As for the wild animals, the game, and the "vermin," the *feræ naturæ* of England are but limited after all, and Mr. Jefferies has often ere now invited us to observe their habits. Nor can we honestly say that his latest book shows evidences of that improvement in literary workmanship which we have had pleasure in remarking upon since he wrote his first volume. He is even more desultory in his remarks than in his *Gamekeeper at Home*, darting from subject to subject by no perceptible thread of association, like the dragon-fly that shoots over the surface of the pool, or the playful kittens we may suppose to have been petted by Miss Cicely Luckett in her parlour. Yet, when all has been said, we are happy to admit that we know no other writer on rural matters who could give us so small a volume with so many charms; while it will have all the freshness of new revelations to those who, by some happy accident, may never have met with its predecessors.

The great estate is Okebourne Chase, and the situation, as is generally the case in Mr. Jefferies's books, is somewhere in the scenery of the Southern Downs. How far fancy may be concerned in refreshing the genuine reminiscences which evidently form the basework of the chapters we are not prepared to say; but though the component parts of the varied landscapes may have been combined, they have clearly been painted very closely after nature. Okebourne Chase, as we are left to suppose, had been seldom occupied of late by its owner and his family. The man who had for long been the actual Squire, to all intents and purposes, was old Hilary Luckett, tenant of an extensive farm that was partly freehold, and who was privileged in virtue of a long prescription to exercise sporting rights over the extensive manor. Hilary is himself a characteristic type; he is the wealthy yeoman farmer of the old English school, who grumbles habitually at prices and modern improvements and changes, and occasionally even at the easy landlord he sits under; but who would stand by his landlord all the same, as he well might do, considering their pleasant relations. Cicely, old Hilary's only child, is rather dragged in by the head and shoulders, that she may act as a guide to Mr. Jefferies's readers in the fields, and introduce them besides into the secrets of her dairy. The Okebourne estate embraces every variety of romantic Southern scenery; exhibits chiefly the old-fashioned style of farming, and shows in its park, its covers, and its rambling hedgerows almost every species of timber. In the extensive Chase you follow the neglected paths, where, though they have been kept open to the public from time immemorial, the parishioners seem but seldom to exercise their right of way. Most picturesque is the description of Hilary's own farm-steading; and of a lake that lies in a hollow, in the seclusion of the overgrown woods. We have an admirable picture of the pond, as the writer is supposed to have visited it on one occasion, when the heavy rain-clouds were louring overhead, and the stifling weight of the atmosphere portended the coming storm. The pond was approached by a "much-neglected path through the fir-plantations." Each step took the pedestrian into deeper silence—"the sudden call of a jay was startling in its harsh contrast. Presently the path widened where the thickly planted firs

* *Round About a Great Estate.* By Richard Jefferies, Author of "The Gamekeeper at Home," &c. London: Smith, Elder, & Co. 1880.

were succeeded by sycamores, horse-chestnuts, alders, and aspens—trees which stand further apart, and beneath which some undergrowth grew. Here there were thickets of hawthorn and bramble and alder bushes which can find no place among firs." The pond itself filled the bottom of the hollow. At one time it had been only one of a series, which were used to supply the table of the Manor House with fish. But long ago, with the opening of communications to the sea, the breeding and netting of fish had been abandoned. Now the spot was naturally the favourite haunt of the inland waterfowl that love peace and solitude. In the heat of that close July day the moorhens, at the approach of the intruder, withdrew to the thick cover of the hedges. Where there was a clear space among the rushes and the covering of weeds, a jack might be seen basking on the surface. Otherwise, there were few sights or sounds to indicate the presence of animal life. Not many birds, we are told, except such as are formed for swimming, come to a still pond. If you cared to listen to the notes of the thrush and the blackbird, you had to seek them in the thickets along the course of the sparkling stream, that trickled downwards to the pond, threading its way through the tangled undergrowth. While the visitor was musing, the thunderstorm burst upon him, and he sought refuge from the rain in a deserted ice cellar. Then, as his manner is, he takes to expatiating on the influences of such a storm on certain members of the animal creation. He has remarked that "woodpigeons and many other birds seem to come home to woods and copses before and during a storm." And he suggests that even the most insignificant insects must have some warning instinct of self-protection in the circumstances. How otherwise, he asks, do "the gnats playing under the horse-chestnut boughs escape being struck down by the heavy rain-drops, each one of which looks as if it would drown so small a creature?" Which leads him on to comment on the countless swarms of insects, which may be seen sporting anywhere of a summer-day. And *à propos* to that he recalls an incident, where a remarkable effect had impressed him strongly. He chanced to be gazing up at a church steeple, when he saw what seemed like thin smoke issuing from the top of it. The swaying wreaths of apparent smoke that lightly clouded the atmosphere proved to be innumerable crowds of tiny insects, whose multitudes made them visible at that great height. By way of contrast to the gloomy picture of that lonely pond in the woods, we may retrace our steps to Hilary's farmhouse at "Luckett's Place," with its home-like airs of comfort and plenty. The kitchen, which was still the family living-room, had originally formed the house, the rest of the rooms having been added by successive occupants. That kitchen appeared to have been built for eternity rather than time. "The walls were quite four feet thick, and the one small lattice window in its deep recess scarcely let in sufficient light, even on a summer's day, to dispel the gloom, except at one particular time." The ground around seemed gradually to have risen, for the small green and yellow panes were barely above its level, "so that the birds which came searching along among the grasses and pieces of wood thrown carelessly aside against the wall could see into the room." The old oaken table was solid as the walls—so solid, indeed, that a strong man could hardly move it; there was no ceiling, properly so called; and from the kitchen a ponderous oaken door led straight down into the cellar.

From that low-roofed but luxurious kitchen in Luckett's Place as a centre we are led out into the woods and fields with the shrewd old Hilary, garnering those fruits of his long experience, which were flavoured sometimes with prejudice and now and then with superstition. And in the author's desultory flights we are carried back to the vivid recollections of the childhood and girlhood of his daughter. Hilary himself well remembered the good old times, the golden age of the British farmer, when the inflated war prices had suddenly enriched him, and when he hardly knew how to indulge himself with the sudden influx of wealth. Having lived entirely out of the world, removed even from the great highways which were daily travelled by the stage-coaches, the ordinary farmer had no habits of amusement, and knew nothing better to do with his money than to drink it. Mr. Jefferies gives us some of the old legends that nowadays sound almost romantically fabulous of narrow-minded, sensual natures, with drink-proof heads and stomachs. Thus there was a certain old gentleman, a relation of Hilary's, who had his home in a solitary farmhouse in the laps of the Downs, called the Idovers. There he and his boon companions were wont to assemble, and settle down to such an indefinite period of solemn carousing as we read of in the happy Irish days and the Memoirs of Sir Jonah Barrington. The cronies began by putting up the shutters, so that they needed to fear no inconvenient reproaches from the sunshine as to the flight of time. They drank heady ale, of all things in the world; for wines, and even spirits, were as yet unfamiliar luxuries in the country districts. And we need not wonder that they drank themselves stupid; so that sometimes, when the head carter intruded for orders, he would find that his master had lost count of a day, and would insist upon enforcing the instructions given for twenty-four hours before. So we might go on *ad infinitum*, making amusing extracts as to man and the lower animals from what we may call a note-book of the country. But we have said sufficient to give a fair notion of the contents of chapters which should have something in them to suit the tastes of everybody who is in any way interested in rural matters.

THE SPORT OF FATE.*

UNDER the title of *The Sport of Fate* Mr. Dowling gives his readers eleven separate stories. We do not pretend to have read them all. We selected one or two as a sample, and we were not tempted in the least to take the whole lot. He delights in horrors, as we well remember from his last story, but unfortunately his horrors always have something ludicrous about them. Just when our blood ought to begin to run cold we find ourselves either yawning or laughing. He shows no mercy towards either hero or heroine. He is ready to sacrifice them both to an untimely death, can he only succeed in exciting the sensibility of his readers. But long before the young couple are made away with the reader's patience is fairly exhausted. All he wants is to see the last of them. Whether it is by a wedding or two funeral services that he gets rid of them matters not to him a pin. If he were able to choose their fate, he would, in the despair into which they have thrown him by their intolerable dulness, like best of all to see them hanged. *Ad patibulum! ad patibulum!* he would cry out as, like the drowsy judge in the Duke of Alva's court, he roused himself from his sleep. Yet Mr. Dowling really makes a very great effort to win his readers' attention. He does not spare himself or them either. He knows a great number of big words, and he is by no means niggardly in using them. He plays with our language all the latest modern tricks, and produces some really surprising combinations. Look at his first heroine, and own at once that he has got more out of a single pair of eyes than could, with any show of reason, be expected. See them blue, suffused with a blaze of violet light, dilated and wild with the inspiration in them of a thought too august for utterance, and too intolerable to hold. Surely they are almost as admirable phenomena as the dilated winter stars that, on the very next page, flamed overhead. From her eyes turn to her golden hair. See it as it floats stiffly back from her head as though blown by a wind. Yet she was all the time in a room, with the windows shut, and not even so much as a draught possible. The young lady was just going to part with her lover and was filled with a fear only too just that he might never return. Her hair ought no doubt at such a moment to have stood on end, but since certain modern refinements in the hairdresser's art came in, standing on end has become, we believe, quite a thing of the past. The most that can be expected is that it shall do its best to assume an erect position, and, in accordance with the law known as the parallelogram of forces, shall float out stiffly behind. This young lady, whose name by the way is Agnes, has a rival in a certain Louise. It might well have been thought that, so far as eyes were concerned, Mr. Dowling had done all that could be required of him in one story. He has ten to follow, and the reader feels that eleven pairs of eyes must be quite enough at one time for a writer. Not so thinks our author. He is bent on outdoing himself. The blue blaze of violet light was, no doubt, a considerable effort, but, as the brightness of these eyes is to be dimmed by a rival's, a still greater effort must be made. He thus describes them:—

> The eyes were the miracle. They were large with enormous pupils; what could be seen of the iris was a kind of red black—black with a flame behind. It seemed to Charles Mallard that one might plunge into the lurid depths of those wonderful eyes. Infinite abysses of the soul lay revealed in them; they seemed but a transparent veil over the immortal ether. She was not beautiful. She was inexplicably confounding.
>
> He forgot he was staring at her, and that his presence had been unexplained.

We have forgotten in our turn to introduce the hero to our reader. He was a young artist who took pride in owning that he was a Pagan governing himself by a Christian code. His appearance was not very remarkable, yet he would, we are told, if he had worn long hair and a smoking-cap, have looked the ideal artist of a stage-play. At the time that we make his acquaintance he was employed in a somewhat humble line of his profession. He was engaged by a provincial photographer to take copies of photographic likenesses in oil. Among those whose portraits he had thus to take was the young lady of the first pair of eyes. He drew a hasty sketch of her on a loose sheet of paper. He held it up to the light, but with a cry he sprang back. On the back of the paper was "a ghastly jest"—a sketch of himself holding in his hand a cup with the word "Lethe" on it, while at his feet lay a broken bottle, one of the fragments of which was labelled with a death's head and cross-bones. It was in vain that he laughed a forced laugh. He had been, and with good reason too, deeply affected by the sight. However, he cannot drive her out of his thoughts, but begins to paint her, not from the photographs, but out of his own head. To do this he assumed a remarkable position. "He bent low. He drew all his body together." He shut himself up in the painting-room for some days, and refused to leave it even to get his meals. We doubt whether he had even access to soap and water. At all events, when at the end of the sixth day he came out it was seen that he had not shaved during the whole time, and the dark shaggy beard bristled on his chin. He called a cab and, entirely forgetful of his appearance, drove off straight to the heroine's home. "It appeared to him that he was acting under the influence of pre-ordination." It is scarcely to be wondered at that the maid-servant, when she had let him in, knowing nothing of pre-ordination and judging only by his unshaved

* *The Sport of Fate.* By Richard Dowling, Author of "The Mystery of Killard," "The Weird Sisters," &c. 3 vols. London: Tinsley Brothers. 1880.

chin, told her mistress that there was "a man" waiting to see her master.

The absence of soap and water would seem, however to have been explained to the satisfaction of all parties, for, without any description of the wooing, we suddenly find the painter engaged to Agnes. It was a remarkable morning on which we find them meeting. "It seemed, somewhile after the sun had risen, as if in the valley "some Titanic hand was slowly peeling off the black night and exposing luminous gold." More surprising still, "the dew of the grass is startled into incandescent vibrations. . . . Before the lovers shoot the voiceless shadows of the dawn; all around them silence has spread a net; the meshes of the net are wide enough for birds to enter." Wide enough, also, we should imagine, for the cackle of the village goose and the bray of the village jackass. For such sounds, let novelists keep as silent about them as they please, will make their way to the ears of lovers through the net spread by silence, and across even their own voiceless shadows. The young couple seem very happy, but the hero persists in announcing once more that he is a Pagan living within a Christian code. Thereupon her blue eyes are full of unrest. Whether there was also the blaze of violet light, we are not told. Before long she is consoled, and grows so happy, that she rejoices in everything she sees. "She watched the sheep and cows lying in the gracious shade of the spreading oaks, and drew her arms across her bosom in congratulation at their comfort." What would she have done had she come upon that very picture of comfort, a fat sow sleeping in the sunshine on a litter of straw against an old fence? The hero, all too soon, breaks in upon the heroine's happiness. He resolves to go to London to push his fortune, and one winter evening he goes to take leave of her. Then it was that her hair stood stiffly back from her head, and the blue blaze of violet light was seen. She rushed out of the room, wailed in a whisper, and moaned out his name. *Wail*, by the way, is defined by Johnson as *to grieve audibly*, but alliteration at the present day is always allowed to make up for the absence of meaning. The hero drives off. The cab-horse's hoofs beat sharply right and left—really a very remarkable animal the reader will allow—and produced ringing detonations. On the drive the following strange incident is noted down by the careful author:—

When halfway the distance between the Gap House and Westoake had been gained Charles Mallard tapped at the glass, told the driver to stop, and got out.

"Did you hear any noise?" he asked the driver.

"No, sir; not a sound."

"You heard no one call out?"

"No, sir, certain."

"You are sure no one called out anything from that direction?" pointing towards the Mill.

"Quite sure."

"It's very odd," said Charles Mallard, stepping into the cab and closing the door. "Drive on," he shouted through the window, and as he threw himself back he muttered: "I could have sworn I heard someone cry out 'Farewell!'"

The hero takes the train to London, and sees a wonderful vision, at the end of which the heroine, as it seemed to him, first shrieked and then "threw one arm up wildly to Heaven and pointed with her depressed hand at the —— dead." He has scarcely got over his first dream, when he has a second, in which he sees himself clinging to sandy unresisting slopes overhanging a blind abyss. "All was chaotic in his mind, all was portentous around." A figure in a long robe rises before him menacing his front, and introduces herself as the Nemesis of his picture 'Night.'" Visions in a railway train must come to an end, and the traveller at last finds himself in London. He meets with no success, and leaves off writing to Agnes. She, like a true heroine, seeks her brother Sam. "Sam," she said in a quiet voice, "can you go to London this afternoon?" She says that he must not only go but take her. "Sam fell back against the wall speechless." He looked at her closely, and saw the calm, desperate expression of her eyes. Whether her hair stood stiffly back the author forgets to tell us; but no doubt the blue violet flash was enough. Sam yields. They go to the faithless hero's lodgings but find that he has gone away, and left no address. Sam, with a complaisance which does him infinite credit, thereupon asks her where to go next. "Home," she replies. They take a cab. She exclaims "How cold it is," and begins to shiver. He shouts "Drive on" to the cabman who, by the way, does not seem for a moment to have left off driving. "I never felt like this before," she whispered—though not this time in a wail. "Drive on," Sam shouted out once more to the driver. "I think I'm going to faint," she said. "Sam had murder in his heart," though whether it was against the slow cabman or the hero that he entertained these desperate thoughts we are nowhere told. At length they got her home. She had felt cold all the way; but the reader is soon comforted, for the last he hears of her on this adventure is that "on reaching Sam's house she went to bed and slept soundly and long."

The hero meanwhile falls in love with the owner of the rival pair of eyes. The first time he beheld them was under curious circumstances, for owing to the heat of the room in which he was "he saw all that passed through a vibrating vapour which rimmed objects with prismatic frames." He soon forgets poor Agnes, the jocundity of whose youth was, we read, now obscured; while he, on the other hand, has a dim consciousness that he is a new entity. Louise discovers his faithlessness to Agnes, and refuses to have anything to do with him. He suddenly learns that Agnes is dead, and at once sees red stains on his hands. The story, by the way, bears the cheerful name of *Red Hands*. He hurries off to a Bohemian drinking party, and calls for brandy. Seeing that the guests were disturbed by his strange appearance, he looked around with a mechanical smile, and asked, "Has a raven come among you?" Before long he dashes out, they pursue him, shouting out, "to the river," in the belief that he was going to drown himself. The reader who remembers his vision expects no such end for him as that. He hurries down to the country, is present at Agnes's funeral, sees "the annihilating results of his own act, with its constituent despair," and "resolves to cut the tow-rope between him and the past." In other words, he means to go to America. Unfortunately ships start from shores, and shores have "sandy unresisting slopes overhanging a blind abyss." He takes a walk along the cliff followed at a distance by a closely muffled-up figure, who proves to be Louise. She draws near him. He stops suddenly, and shivers as the memory of the dream came upon him. She appears, he calls out, "The Spirit of Revenge at last." She assures him that she is no Spirit of Revenge but poor Louise. He repeats in a chill whisper, the Spirit of Revenge, and tumbles down the cliff. Whether she follows we do not clearly make out. We take leave of her first gasping, then laughing and crying, and holding the stones in the pathway, as though to prevent herself sliding down a slippery steep. Whether she slides or not is happily a matter of utter indifference to the reader who is fully satisfied so long as he is allowed to see the last of her.

QUILTER'S GIOTTO.*

THERE are only two cases in which it can be desirable to send out to the world a large book about one single artist—namely, when the materials for a life of the artist are copious, or when the author of the essay claims attention from his high position as a critic. Mr. Harry Quilter can hardly justify his handsome volume on either of these grounds. The knowledge we possess of the facts of Giotto's life is not only limited but hackneyed; and Mr. Quilter, for a very good reason, as we shall see, has been able to add nothing to it. On the other hand, he is a beginner in the art of authorship, and possesses as yet none of that authority which makes the dicta of a first-rate critic interesting, whatever the theme he discusses. It will be long, we fear, before he will attain this position; at present his style, which is as egotistical as it is jejune, fails to conduct the reader with any comfort through an essay that is radically and needlessly tedious. The general sketch of Giotto's life collected by Vasari continues to be our great storehouse of information on the subject. To this the laborious investigations of Messrs. Crowe and Cavalcaselle have added something in the way of detail and of conjecture. Mr. Quilter has informed us that his ignorance of the Italian language and the small amount of time at his disposal have placed it out of his power to make that examination of MSS. which alone could determine the accurate chronology of Giotto's life. We are at a loss which to admire most, the youthful confidence which is so certain that it could have easily obtained what the zeal, patience, and learning of all the best German and Italian authorities have failed to reach, or the rashness which undertook so readily a work for which the author possessed, at his own showing, neither the necessary learning nor the necessary leisure. When we learn that the pressure on Mr. Quilter's time was so excessive as to forbid him to see the mosaic of the Navicella at Rome, or the wonderful Sta. Chiara fresco now at Naples, we cannot help wishing that his trip to Italy had been, in Dr. Johnson's phrase, not merely difficult, but impossible. On the critical side the æsthetic quality of Giotto's works was long ago pointed out, with extreme subtlety and almost excessive fulness, by Mr. Ruskin, in one of his less-known volumes, *Giotto and his Works in Padua*, written for the Arundel Society. This essay, laid under constant requisition, forms, with the criticisms of Lord Lindsay and of Kugler, Mr. Quilter's main source of inspiration.

If, however, there is little here that is fresh or interesting about Giotto, there is much that is very delightful and absolutely new about Mr. Quilter himself. Chapter VIII., at present entitled "Giotto at Padua," needs but to be rechristened "Mr. Quilter at Padua" to command the flagging interest of the reader and to display its own genuine value. Mr. Harry Quilter, guiltless of the Italian language, proudly standing, as the representative of English art-criticism, in a tweed suit, at the door of the principal hotel of Padua, is a figure to make the dejected English bosom leap with pleasure. We linger over every feature of the long-drawn picture. We see Mr. Harry Quilter soiling his tweed suit with Paduan mud, and determining that it would not do to call upon Giotto in that disarray; we follow him to his stately dinner, "*wherein* [*sic*] the landlord figured as sole attendant"; we are even permitted to accompany him to his "paved bedchamber," and to smile at the indiscretion of "a fresh little breeze that rattled cheerfully to and fro the big window-shutters, and hinted at its being time to get up." We look out of window with him, and observe that he has lost his English, though he has not found his Italian; for he points out to us, among a dozen wonders of the same novel kind, a maiden who is "partaking of a chunk of sausage." Starting at last, we have a beautiful glimpse of him, sitting in the tweed suit on the seat of a "mournful carriage,"

* *Giotto*. By Harry Quilter. London: Sampson Low & Co.

and "venting the content of his soul as he goes along, in the solitary Italian phrase he was master of, by waving his hand to the young coachman, and saying *chè bel tempo!*" What the *vetturino* replied to this extraordinary utterance was more than our author could make out; but his looks were so eloquent that Mr. Quilter joyously compared himself to Æneas.

We will not follow the vivacious traveller into the Scrovegni Chapel, but hurry on to the tenth chapter, which might be called "Mr. Quilter at Assisi." This is no less thrilling in its homely details. We learn that the distinguished visitor arrived at night by train, that he could scarcely read the name of the station, and that "neither guard nor porter expected him to alight." It would have been a fit chastisement to neglectful Assisi if Mr. Quilter had passed on, but he was magnanimous, and deigned to "alight." His progress through the town was marked by much mystery and courage, for he was "able to defy the ominous silence of Bradshaw and the neglect of Cook," and was "more regardful of what has been than what is." He behaved more like an ordinary human being in consigning his bag to the "least ill-favoured inn tout" that he could find, and in spite of the neglect of the guards and porters, he began ere long to look upon Assisi "as an old friend." We find, by the way, that even Mr. Quilter may be caught tripping in matters of courtesy, for he "scurried past reedy Thrasymene without recognition," and should, therefore have been more merciful to the rustic railway officials at Assisi. The chapter concerning Florence is unfortunately much less rich in those little personal details, which are so welcome in the biographies of the great. Our author, however, informs us that he travelled first class to Florence, and that the carriage was comfortable, minute but salient points upon which the imagination of future students will be able to build an image, vague perhaps, but very intense and bright.

All this, however interesting, carries us far away from Giotto, and we must hasten to do justice to those passages in which our author has turned from the figure in the tweed suit to the old Florentine painter. Even here there is a good deal of Mr. Quilter, and instruction is doled out to us with a charming air of hortatory familiarity. Here is an instance:—

Now, you must quite get rid of the idea that the colouring of these frescoes is crude and violent, because I call it pure,

where, however, we believe it would be an error to suppose, as the reader is apt to do, that the sole reason for rejecting a prejudice against the colour of these frescoes is Mr. Quilter's affirmation of its purity. Sometimes we are treated to dramatic passages, as the following, which is placed in the mouth of Giotto. The person so jauntily addressed is the great master, Taddeo Gaddi:—

Look here, Gaddi, this a great chance (*sic*) for you to distinguish yourself; mind you make the most of it. Don't forget that what you have to do is to complete Cimabue's work; you must not make his compositions look more absurd and unnatural than you can help; above all, your work must be in keeping with his in colour, or you'll spoil the church. Mind you preserve the character of the architecture, and keep it uniform throughout; and if you let your work be a little conventional, it will be all the better.

As we listen to these impressive sentences we are reminded of the literary medium who a few years ago announced her communion with the spirits of Shelley, Burns, and other such folk. It was most interesting, and by and by the gifted dead dictated new and unpublished verses to her, which was more interesting still. Unfortunately their descent into Hades had robbed the great poets of every scrap of art or talent, and their spiritualistic utterances were as unworthy of their fame as these counsels to "Gaddi" are of the fame of Giotto.

A young gentleman who sneers again and again at what he is pleased to call "the mass of verbiage" in which Messrs. Crowe and Cavalcaselle envelop their researches, and who "cannot attach much importance" to the conclusions of those eminent critics, mainly because, standing on the steps of the high altar at the lower church of Assisi, it appeared inconceivable to himself that the authorship of the frescoes before him could be questioned, is not likely to be much affected by, or, if we may say so, to deserve, very serious discussion of his theories, or very grave reproof of his superficiality. We may very well leave him to be demolished by the specialists, if any of them take occasion to refer to his little book. Yet we believe that Mr. Quilter has sufficient talent, if he will take pains and be modest, to write in the future what may be more worthy of attention than the essay before us. It seems to us that we note a distinct improvement as the book proceeds. Of the earlier chapters we can only record our impression that, for garrulous conceit and glib ignorance they are almost unequalled in our experience of literature. But, as Mr. Quilter was forced by the development of his book to think more and study more, he dropped his eccentricities one by one, and became rather dull perhaps at times, but far less conceited and absurd. We suppose that it is his first essay in book-making. If so, the kindest thing his friends could have done would have been to destroy his manuscript when it was half finished, and to make him write it again. Experience, no doubt, will teach him that the public does not care about his dinners and his jokes, and his tweed suit, and that in this crowded world of ours, the butterfly wings of youthful self-satisfaction are apt to get sadly crushed if they flap in people's faces. We have taken the beginning of Mr. Quilter's book rather lightly, and we will, therefore, not close this notice without quoting, with serious approval Mr. Quilter's last sentence:—

I like to think that Campanile of porphyry and jasper was not raised by one who dwelt amidst cold dreams of architectural proportion, and gave his life to the designing of geometrical ornament, but by the man who could feel the humour of the dog, the patience of the oxen, and love to have such things carved about the base of his tower; and as I sit here in its very shadow, it seems to me as if the most fitting meed of praise with which to conclude an essay on the old painter, is not that he painted the purest and loveliest frescoes in the world; not that he raised above Florence a tower, which has been the wonder and delight of all succeeding ages, but that he was the first to show by his work, that Art was useful to man, not only as a teacher, but as a friend.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, *including postage to any part of the United States, is £1 10s. 4d., or $7 58 gold, and may be forwarded direct to the Publisher, Mr.* DAVID JONES, *at the Office, 38 Southampton Street, Strand, or to* Mr. B. F. STEVENS, *American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.*

PARIS.

Copies of the SATURDAY REVIEW *may be obtained every Saturday of* M. FOTHERINGHAM, 8 *Rue Neuve des Capucines.*

The SATURDAY REVIEW *is duly registered for transmission abroad.*

Nearly all the back Numbers of the SATURDAY REVIEW *may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.*

The publication of the SATURDAY REVIEW *takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.*

Copies of the SATURDAY REVIEW *Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.*

Now ready, VOLUME XLIX., bound in cloth, price 16s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

AFGHANISTAN.

THE alarming rumours which were circulated at the close of last week in reference to Afghan matters were fortunately proved to be false or exaggerated early in the present week. No serious impediment has interfered with General ROBERTS's advance, and that officer, after a march almost unparalleled in these days of elaborate impediments and somewhat too careful provision for comfort and luxury, reached Candahar on Tuesday. No confirmation whatever of the reported disturbances at Cabul has come from any quarter, and the mutiny of the Khan of KHELAT's troops was, it seems, confined to an insignificant number of men. Matters indeed have emerged pretty completely from the state of rumour in which they were for the most part while General ROBERTS was marching through no man's land. The invading forces and the relieving expedition are now face to face. General PRIMROSE and General ROBERTS have effected their junction, and every hour, almost every moment, may bring us the news of the decisive battle or of a retreat on the part of AYOUB, which would be not indeed equally decisive, but conclusive at any rate of the present situation. The negotiations spoken of are not likely to come to much, as General ROBERTS has rightly insisted on a surrender at discretion. The Afghan Prince is very strongly posted, and one of the latest of the many fluctuating accounts of his force gives him a formidable army of more than twenty thousand men. General ROBERTS can probably dispose for purposes of attack of not much more than two-thirds of the number. But all, save a very small fraction of these troops, are of the very best quality, able beyond all doubt to give a good account of an Afghan force not merely twice but thrice or four times their strength. The third General who should have completed General ROBERTS's force to a still more formidable total is indeed absent. General PHAYRE has not even yet ended his six weeks' struggle with the difficulties of his route and the badness of the arrangements made for his journey. He too, it is thought, will have to fight, perhaps has already fought, his way through some native opposition. It has been confidently asserted that General ROBERTS will not wait for him, but will attack at once. This must probably depend on circumstances, of which no one not on the spot can judge. At a distance it certainly seems as if the attack could not be made too soon, for reasons which a little consideration will make obvious.

It is now certain that AYOUB has been joined by ABDUL RAHMAN's chief rival, the boy MUSA KHAN, and by most of the malcontent chiefs who were wont to rendezvous at Ghuznee, with the exception of MUSHK-I-ALUM and MAHOMET JAN. The former would appear to have loyally espoused ABDUL RAHMAN's cause, of the latter nothing has been heard of late. This junction indicates beyond a doubt that AYOUB has been accepted as the champion, if not the representative, of the YAKOUB party, and this in its turn makes the reports which continue to be spread of an understanding between ABDUL RAHMAN and AYOUB almost incredible. But, on the other hand, it makes it not improbable that AYOUB, instead of giving battle to General ROBERTS, will attempt to slip past him and march for Cabul. There is no doubt at all that he would in that case receive large accessions from the warlike tribes of the centre, and although some of his present troops might be unwilling to fight against the AMEER, there would probably be quite sufficient left for the purpose. Such conduct on his part has for some time been recognized as constituting the great difficulty of the situation. So long as General ROBERTS was at a certain distance from Candahar, he had it in his power to checkmate any such course on AYOUB's part by a rapid flank movement into the Valley of the Arghandab. It is to be feared that, since he has been obliged to march on the city by General PHAYRE's failure to keep tryst, he has lost this power. Now it need hardly be said that it would be particularly awkward for the present Government if AYOUB were to execute this plan. Their retirement from Cabul would then be cast up against them with much greater force than is now the case, and they would have to define at once and strictly their relations with ABDUL RAHMAN. Now this is exactly what, to all appearance, they are desperately anxious not to do. "Take "Cabul, and let us hear no more about you," may be said to be, in few words, the language of Lord HARTINGTON to the new AMEER. The worst of it is that we are likely, for a considerable time to come, to go on hearing of Afghanistan. Ostrich policies never pay well, and the resolution of the GLADSTONE Government now, as of old, to try and ignore the existence of the neighbour of India is likely to bear the same fruit in the future that it has borne in the past. But, for the present, a decisive victory at Baba Wali—especially if it were followed by the capture or surrender of AYOUB and of MUSA—would be a godsend to the Government, while it is so decidedly needed to restore the credit of the Indian army, that every Englishman, whatever his politics, must be as anxious for it as any member of the Government can be. With the two prominent leaders, or puppets, of the opposition to the present AMEER comfortably interned somewhere in India, ABDUR RAHMAN would have time and opportunity to settle himself on his throne, and Afghanistan would cease to trouble England for exactly so long a time and no longer as it might suit General KAUFMANN to keep it in a state of quiescence. Now, if it had not been for General PHAYRE's being behind time, General ROBERTS might almost have made certain of the battle which, as it is, it is at AYOUB's option to give or to refuse. To the Quetta force might have been left the duty of marching straight to Candahar and effecting a junction with General PRIMROSE, while ROBERTS himself could have taken a cast westwards, and have definitely placed himself between AYOUB and all possible routes to Cabul. There would still have been left the possibility of a retreat to Herat; but this, though troublesome enough, would not have been from the political point of view half so troublesome as the possible advance on Cabul.

Not merely from this consideration, but with regard to the future welfare of our Indian Empire, we cannot but think it of the utmost importance that, as soon as we have settled accounts with AYOUB, a full and searching investigation should be made by the military authorities at home into the conduct of the Candahar division, and that portion of the Bombay army supporting it during the last two or three months, indeed ever since General STEWART began his march to Ghuznee. With the utmost trouble Sir H. DRUMMOND WOLFF has at last extracted some information from the Government as to the VICEROY's part in this matter. But this is only a part. When the first rumours were heard of an advance of AYOUB from Herat, there was not the slightest reason to suspect the possibility of disaster.

Our forces in Southern Afghanistan rested, it is true, on a distant base, but their communication with the base was apparently easy and certain. At one end of the line was Candahar, with a force equal, if not superior, in number to that with which many of our greatest Indian victories have been secured. To the south the line to Quetta was held by parties of troops échelonned along it, and at Quetta a considerable force was supposed to be massing to support that at Candahar, and reinforce it if necessary. Behind Quetta a stretch of somewhat difficult country lay; but the sovereign of this country was an assured friend. As soon as the mountains were crossed the head of a railway was reached, communicating with the Indus, and then, by easy communication, both land and water, with Kurrachee and Bombay itself. The authorities who presided over the different portions of this chain had ample warning of the approach of the invaders. Yet from the very moment that AYOUB arrived within striking distance everything has been blunder, confusion, and failure. A general was sent out to bear the brunt of the attack who is said (and we have not seen it denied) never to have seen any active service whatever. When half, and more than half, the forces sent with him mutinied and joined the enemy, the plan was not changed, nor were reinforcements sent. The information department seems to have been constantly behind the time, and when the siege of Candahar was actually formed, the only important movement attempted—the sortie of the 16th—was repulsed with loss. But these things are as nothing compared with the failure of the supports. The very best arrangements will not ensure us against disasters arising from individual incompetency. But good arrangements are absolutely proof against such failure as that which has, as we have seen, disconcerted General ROBERTS's plan, and reduced him to the alternative of wasting valuable time or of fighting with diminished forces and in a position which leaves the enemy the option of evasion. Considering the number of troops available between Bombay and Chaman, the means of transport at their disposal, the distances to be covered, and the circumstances of the country, a fortnight might have been required to place a respectable force in marching order at Chaman. Even a fortnight seems somewhat long when we remember how much may happen in that time. The facts are, that six weeks have not sufficed. Now, if there is one thing upon which the safety of our Indian Empire depends, it is the mobility of our troops. Considerable as is the garrison we maintain there, the enormous space it has to cover can only be defended successfully by a force which can be mobilized at once. We have spent vast sums on railways; and the outlay on more perishable means of transport, when they are required, is proverbially lavish. What can be done when there is heart in the work and when the means are in working order is shown by General ROBERTS's march at the shortest notice, with ten thousand men of all arms, over a hundred and thirty-six miles of difficult country in eight days, and by General GOUGH's march, with two cavalry regiments, of thirty-four miles in a single day. With this has to be contrasted the fact that General PHAYRE, acting on a line established for the support of General PRIMROSE, resting on the capital of a Presidency at one end, and furnished for all but a small part of the way with steam and railway communication, has been unable in six weeks to take a relieving army to the walls of Candahar.

IRELAND.

MR. FORSTER'S latest version of his own intentions is not altogether satisfactory. He persists in substituting for law his own notions of justice. He declares that, if the landowners exercise their rights so as to incur his disapproval, he will personally decline to enforce the law. In other words, he will tender his resignation to his colleagues unless they concur with him in promoting a new Disturbance Bill. The probable result would be the retirement of the moderate members of the Cabinet, and an increase of the influence which is at present exercised by Mr. GLADSTONE, Mr. BRIGHT, Mr. CHAMBERLAIN, and, with less danger to existing institutions, by Mr. FORSTER himself. Mr. PARNELL, in a few epigrammatic words, summed up the Irish question. If, he said, the Constabulary were abolished, there would be no need for a change in the Land-law. An exactly similar proposal was in fabulous times made by the wolves when they suggested that the sheep-dogs should be withdrawn from the fold. The Land League would make and execute their own laws but for the force which is at the disposal of more legitimate authorities. Parliament is happily about to disperse; but the Irish agitation proceeds with constantly augmenting violence; and the Government takes no effectual measures for the protection of life and property. The demagogues who address seditious meetings no longer trouble themselves to accuse the landlords of oppression by the exaction of excessive rent or by inconsiderate eviction. The offence of the landowner is that he owns land which, in the popular judgment, ought to be transferred to the occupier. The itinerant orators are in truth much more consistent than Mr. FORSTER. He professes his determination not to protect or assist legal claims which he may by some arbitrary test determine to be unjust. The Land League resolves that rent is in itself unjust, though a few months ago its leaders pretended to advise the tenants to pay a fair rent instead of the stipulated amount. In spite of the warnings of the more rational members of the popular party, the demagogues decline to consider the question which would arise if the holdings of actual occupiers were converted by purchase or by force into freeholds. The majority of the population would still be landless; and there would be little or no demand for hired labour. The agitators constantly dwell on the invalidity of titles which date from the times of ELIZABETH or of CROMWELL, though in civilized countries a much shorter prescription is universally recognized; but even the impudence of a Land League declaimer would scarcely suffice to maintain the proposition that the present holders are the heirs of the original owners of the land. Mr. BRIGHT's scheme of purchasing farms with the aid of the State seems to attract little attention. The assumption by the Imperial Government of the character of universal landlord or mortgagee would be a chronic invitation to rebellion. When the change was effected no Irish Secretary, however devoted he might be to Liberal politics, could profess to distinguish between just and unjust demands for rent or interest.

By far the most novel, and not the least tenable, theory of Irish disorder has, in accordance with his well-known views, been promulgated by Mr. FROUDE. He attributes all Irish evils to anarchy resulting from a refusal on the part of England to deviate from traditions of law and liberty, which are, in Mr. FROUDE's opinion, wholly inapplicable to the population of Ireland. He censures, with a plainness, which leaves nothing to be desired, the whole system of affecting to govern Ireland according to Irish ideas, and not with exclusive reference to Irish needs. The protection of legal rights and the punishment of crime are, in Mr. FROUDE's judgment, far more indispensable than the pedantic maintenance of constitutional doctrines. He would prosecute leaders of sedition, rioters, and murderers with inexorable rigour; and, if juries refused to convict, he would transfer criminal jurisdiction to judges, and require the tribunals to do their duty. To Mr. FROUDE it seems not a light thing that Mr. BIGGAR should vindicate in the House of Commons the brutal and treacherous murder of Lord LEITRIM. He apparently suspects Mr. GLADSTONE of a deliberate intention to destroy or disturb the principle of property in land. He believes that Mr. GLADSTONE must have foreseen the rejection of the Disturbance Bill by the House of Lords, and that he must have intended the measure merely as a sanction of the revolutionary demand for the abolition of rent. It cannot be suspected that Mr. FROUDE is in this case influenced by political or personal prejudice. During the Bulgarian agitation, and throughout the Eastern crisis, Mr. GLADSTONE had no more zealous supporter than Mr. FROUDE. The demand for a reversal of the Irish policy of the present Government, and indeed of all modern Governments and Parliaments, may perhaps be injudicious, but it is undoubtedly sincere.

That the strongest Coercion Bill which could be devised would be desirable, if there were no other means of suppressing the anarchy which prevails in Ireland, seems to many politicians a truism. It might probably be not impossible to govern by methods less rigorous than CAVOUR's state of siege; but it is above all things necessary to govern. The orators and the newspaper writers who employ themselves in the encouragement of crime should be in the first instance sentenced and punished, though it might be impossible to reach their patrons and abettors in the House

of Commons. Every impediment should be offered to the acquisition and possession of arms by the disaffected classes; and, as Mr. FROUDE suggests, juries should be superseded or suspended if they fail to discharge their duties. Few modern measures have done so much to decrease the sufferings of Ireland as the Peace Preservation Acts, which have for two generations been persistently passed, enforced, relaxed, and ultimately repealed. It is not even an injury to the class which is most directly affected by Coercion Acts that it is restrained from crime. Mr. FORSTER has lately become aware that it may perhaps be necessary to demand powers for the preservation of life and property. It is unfortunate that he should have intimated as a probable condition of the discharge of a duty a refusal in cases which must be arbitrarily selected to enforce the law. It is true that no Peace Preservation Act would remedy the distress of Ireland, though it might incidentally tend to mitigate its effects; but no Government can put an end to poverty, while it is the first business of all Governments to prevent and punish crime. If it is possible by legislation to prevent the recurrence of distress, it is not at the expense of landlords that the peasantry ought to be relieved.

The main objection to Mr. FROUDE's arguments and proposals are that they are paradoxical, or, in other words, that they are opposed to popular opinion. It may be a grievous misfortune that Great Britain is inextricably linked to Ireland with the obligation either to make the country civilized and prosperous, or to suffer by its misgovernment. Free nations find it more difficult than absolute Governments to rule dependencies. As far as the colonies are concerned England has evaded the difficulty by renouncing the liability. Canada, Australia, and New Zealand manage their own affairs, and Ireland would be welcome to Home Rule if it was in another hemisphere. The people of the United States have, with much sagacity, refused to encumber themselves with foreign possessions in which their institutions would not thrive, and which they have no machinery for administering as dependencies. The coloured population of the Southern States might have caused much trouble if they had not been practically deprived of the political power to which they are legally and constitutionally entitled. The States and Territories which have been founded in the West are, for the most, settled by emigrants from the older States, who take with them all the national customs and institutions. The Irish and English have never become homogeneous, though they have now for many years been governed by the same laws. Not even the experience of Irish members, which has extended from the time of O'CONNELL's tail and the POPE's Brass Band to the days of Mr. PARNELL and Mr. BIGGAR, has convinced the English people that it would be possible to withhold representative institutions with all the rights and liberties which they include from any portion of the United Kingdom. Mr. FROUDE's eloquent denunciations of the anomaly of regarding unequal things as equal might produce more effect if he could suggest any admissible alternative. In former times many experiments have been tried with uniform want of success. It would now be impossible to administer Ireland as a mere dependency. The growing strength of the English democracy would place an insurmountable impediment in the way of any attempt of the kind. The extreme Liberal party will never consent to deprive itself of the aid of allies who will always be ready to support revolutionary measures. It is true that an extension of the Irish borough franchise is, as Mr. FROUDE observes, a gift of a stone instead of bread; but the establishment of household suffrage in the English and Scotch counties will be a far more mischievous and dangerous measure. Mr. FROUDE's vigorous protests are like the prophecies of CASSANDRA, of which even the few who believe them understand that they will fail to reach the popular ear until they are accomplished.

THE EGYPTIAN DAIRA.

THE terms of the law of Egyptian liquidation are now known in detail, and it may be said, to the credit of the Commission, that not only is the scheme contained in the law bold and practical, but great attention has been paid to points that may at first seem trifling, and the is a model of clearness and conciseness. For reasons mainly political the holders of the floating debt have been too well treated, and that is the only objection that can be made to the scheme in general. Of the treatment in detail by the Commission of the matters submitted to it no one can judge, except by taking some one portion of the decree and examining it. No portion, perhaps, is more convenient and instructive than that which deals with the Daira, and it so happens that the Report of the Daira for this year has just been published, and thus every necessary material is furnished for an appreciation of the difficulties which the Commissioners had to encounter. The previous history of the Daira was briefly this. Vast estates belonging to the late Khedive formed the guarantee of a loan of nine millions sterling. The interest was fixed at five per cent.; and the estates, if well managed, produced on an average enough to pay this interest; but in years when the crop was poor or prices were low it was not sufficient, and the Khedive undertook to make up any deficiency out of his Civil List. The Khedive would not or could not fulfil his undertaking, and the payment of the coupons was only rendered possible by borrowing, although not to any serious extent. The holders of obligations were protected by a mortgage taken in the names of individuals, but there was no one with legal powers to represent the holders. Further, although the land itself was secured by mortgage, its produce was not. It was liable to be seized for the debts of the Daira; and, as the Daira was the estate of the Khedive, it was held that it was answerable for all the private debts of its owner. As a going concern it was perfectly solvent, but it was weighed down by a mass of debt, with which, as a going concern, it had nothing to do. Then, again, it had become uncertain whose property it was; for the Khedive, in the latter days of his reign, had under pressure made it over to the State; but the formalities of Mahommedan law had not been complied with, and it was probable that, if the holders of obligations had sought to enforce their rights, they would have had to sue a proprietor who was in exile, or, if he died, his family or his heirs. Lastly, the administration was in the hands of a nominee of the Khedive, subject to the supervision of an English and a French Controller, and over all was the Khedive himself, who was supposed to be specially interested in the management of his own estates, and to have special facilities for managing them. Sometimes the Khedive interfered with everything; sometimes he said he was tired of the Daira and would hear nothing of it. It was impossible that the property should be well managed under such a system. The administration was overshadowed by a vague, irresistible, intermittent intervention.

The Commissioners were constituted, or constituted themselves, as a legislative body. Whatever they chose to say was the law became the law. There was no knot they could not cut if they chose to cut it; and all the knots that the Daira presented to their notice they cut with a firm hand. They began with laying down that the property was the property of the State, and in a moment, without any further formality, it passed to the State. They then with a stroke of the pen got the Daira free from its burden of debts with which it had nothing to do. The produce of the estates cannot henceforth be seized for any debts except the real debts of the administration, and only for debts of this class, contracted since July 1877, when the new administration with its foreign Controllers began to work. Then come the pecuniary arrangements. A very large portion of the sums which the Daira had recently been called on to pay consisted of sums properly owed, not by it, but by the Government, and in reimbursement of these sums, and also in compensation for the extinction of the special guarantees given by the Khedive, the Government is ordered to pay out of the funds at the disposal of the Commissioners 450,000*l.*, subject to a deduction of the amount due from the Daira for taxes. If the estates yield enough to pay more than four per cent., the holders of obligations are to get the surplus up to five per cent.; but the Government in any case is to make up what may be necessary to pay four per cent. To prevent the guarantee being illusory, it is enacted that, if the Government fails to fulfil its obligations, the Daira is to pay no taxes on the lands not affected to the Unified Debt until it has thus recouped itself what the Government has failed to pay. No clause in the decree is more valuable to the bondholders than this, for it gives them, as

contrasted with a mere promise to pay, a means of ensuring payment the most efficacious that could be practically operative. Out of the 450,000*l.* a sum of 180,000*l.* is to be set apart as a reserve fund; and to this are to be added the amounts received from the revenue beyond what is necessary to pay five per cent. until the amount of 350,000*l.* is reached, after which point the surplus revenues are to be used in paying off the bonds at eighty per cent. of their nominal value. The primary object of this reserve fund is to ensure the payment of four per cent. interest, so that the bondholders have a double security for their interest in the guarantee of the Government, and in the provision of a reserve fund which, it may be observed, is from the outset exactly equal to the amount of one half-yearly coupon.

The difficulty under which the bondholders laboured in having no one to represent them legally is solved in the simplest manner. It is enacted that the English and French Controllers shall be their representatives, and the question how these Controllers are to be appointed is definitely decided by a provision that the Egyptian Government will accept the nomination of the respective Governments, or, if the other Government does not choose to nominate, will choose some one in the active or retired service of that Government. The system of administration is recast. There is still to be a native Director, but the Controllers are not only to supervise him, but are at liberty to determine any question of administration in regard to which they may think fit to interfere. Above this administrative body is a Council, of which the Director and the Controllers form part, but of which the Egyptian Minister of Finance, the English and French Controllers-General, are also members, and the Council will exercise in a methodical manner the powers of supreme but vague and occasional control formerly reserved to the Khedive. The scheme as a whole is at once fair and favourable to the Daira. It starts fresh and unencumbered. Its legal difficulties are swept away. The bondholders will be represented, and represented by persons who are the choice of the English and French Governments. The administration is simplified and strengthened, and is thrown to a very large degree into the hands of Europeans; and everything has been done to ensure the bondholders getting four per cent. But the bondholders must understand that they cannot reckon on getting more than four per cent. for some time. Not only may there be bad years, but for this year and next year the condition and prospects of the crops are such that more than four per cent. cannot be looked for. Further the Daira has now to pay new taxes which themselves amount to one per cent. on the capital, so that a yield which formerly would have sufficed to pay five per cent. will now only suffice to pay four. And a new burden has been thrown on the Daira, as the Commissioners have enacted that the bonds of the Daira Khassa shall be incorporated in the general debt of the Daira. The Government undertakes to pay 34,000*l.* a year to meet the augmentation of the capital of the Daira debt; but it only gives a simple promise to pay, and the Daira will have to meet the interest, even if the Government does not pay. The simple fact is that the Daira bondholders were in a great mess, and have now got out of it, and may look for four per cent. with the hope of some day and occasionally getting a little more. That they have been extricated from embarrassment is, as is pointed out in the Report, in a large measure due to the energetic protection which Mr. GOSCHEN, ably and cordially aided by his French colleague M. JOUBERT, has given to their interests. It might be added, which, as the Report was drawn by Mr. MONEY, the English Controller, could not be stated in it, that they are also very largely indebted to the zeal, determination, and perseverance with which Mr. MONEY laboured in the practical conduct of their affairs until his connexion with the Daira was recently terminated by his appointment to a higher post in the sphere of Egyptian finance.

THE LAST BURIALS DIVISION.

LORD HARTINGTON was in merry pin at three o'clock in the morning of Wednesday, at which sane hour for delicate deliberation the House of Commons was finally disposing of a Bill on which momentous issues for the future of the Church of England depend. Full of anticipations of the Greenwich feast, even though whitebait has passed away, the leader crowed over the Burials Bill as a measure of conciliation which would make mankind happy all round. One section of mankind has not much cause for self-gratulation at the shape which this triumph of the Liberal cause assumed, and that is the Liberal party itself, that great united party of freedom and loquacity. At the moment of the final success a rift as wide as that in the Roman Forum suddenly yawned, and no MARCUS CURTIUS was there to make the patriotic plunge into the abyss. The last division on the Burials Bill was not the irresistible advance of the serried ranks of progress over a demoralized and dispersed handful of reactionaries; but a victory achieved by the united forces of those Liberals who still desire to uphold the Church of England and of the Conservatives over an angry alliance of Liberationists, Freethinkers, and democrats who had banded together to humiliate and insult that Church.

The proceedings in Committee and upon the Report of the Burials Bill can best be considered together. Practically the motion urged by Mr. BRADLAUGH for disturbing, not only Sunday, but Christmas Day and Good Friday, which was beaten by so inadequate a majority on the first and so sufficient a one on the second occasion; as well as that in which Mr. ILLINGWORTH was thoroughly defeated, for removing the obligation for all services in churchyards to be Christian; and last, but not least, the resistance to the clergy relief clause, must be regarded as the successive battles of a campaign. Step by step the conspiracy which created and has kept alive the agitation of which this Bill is the result has, by their own imprudence, been courting defeat, not only calamitous to their particular cause, but menacing to the future harmony and efficiency of the Liberal party itself. While we were certain that the agitators' pietistic pretence would soon be thrown aside, we could not forecast that the drift of events would unmask the innermost intention of those who were the real promoters of the measure with a completeness and rapidity of which, in the hurry and confusion of a worn-out Session, they were themselves barely conscious. Up to and even during the second reading they were touchy and prodigal, with the honest exception of Mr. WOODALL, in protesting that the aggression was a question of simple burial not of property in the churchyard, of feelings and not of rights, and that, if only their conscientious principles should obtain recognition, they would go away and cease from troubling the Establishment. So matters stood when in the Committee the limitation was reached which gave precise and complete satisfaction to all the ostensible demands of the Nonconformist ministry and its obedient flocks. At this point it suited their Parliamentary leaders to find out that they had never been thinking of being buried as Christians, but as citizens, and that in demanding the use of the churchyards they were demanding a right which, as they formulated the claim, contradicted all the existing legal incidents attaching to those properties which they had hitherto pretended to respect. Hence the sweet accord of Calvinist, Atheist, and some Papists in a colourable repudiation of the word Christian—which really meant antagonism to the established rights of the Church of England. This daring policy simplified the action of the House of Commons. The plea of the discontented cave might be logical, but the attitude of the remaining House was practical. The practical men, whether they owned it or not, felt that the measure, in its mildest form, would be inexpressibly distasteful to the class to whom the State had to look for working it. Logic, on the other side, stood up before the country in the visible shapes of Mr. BRADLAUGH and Mr. LABOUCHERE, backed by the sweet gracefulness of Mr. COLLINGS, so it was not very astonishing that the House decided that between reducing the member for Northampton and Mr. ASHTON DILKE to the painful necessity of a silent burial, and of declining to force facilities upon the Jews, of which the Jews emphatically refused to take advantage, or of scandalizing that wide feeling which could be Christian without being Liberationist, it was wise to choose the former alternative, and despise the harmless imputation of inconsistency.

The HOME SECRETARY's bounceable entrance on Saturday evening into the Committee just as it was closing its proceedings in a fit of almost unaccountable good humour is an incident which cannot lead to any direct political result. It was certainly an eccentric act on the part of a Cabinet Minister to knock over a colleague who was, although out of the Cabinet, conduct-

ing the business of the House in charge of an important Ministerial measure. The inevitable row which resulted was as sharp as it was sudden, and showed that even in this Parliament of delegates and of rebels something has been left of the old spirit of loyal independence. However, Lord HARTINGTON, clothed in the brief, if not little, authority of leader pending the sea-trip of the PRIME MINISTER, summarily repudiated his unruly colleague, and Sir WILLIAM HARCOURT did the best thing left to him to do by tendering his "Beg pardon, and won't "do so again" with the frank confession that when he spoke he knew nothing of the question or of his colleagues' action. It was rumoured that some new members were converted to a belief of the HOME SECRETARY's future docility. Anyhow, the Committee relapsed into the condition of limp boredom so eminently suited for the discussion of the all but last stage of a Bill which is intended to revolutionize the position of one of the estates of the realm. Yet the incident, so far as it affects the character of the Government and the relations of its members towards each other, cannot go to sleep. It is a revelation, which is the more startling because genuine and unpremeditated, of the way in which we are governed; and it is therefore for the nation to say how far it will repose its confidence in a Government which fails in securing harmony of opinion and unity of action even among its own members.

THE NAVAL DEMONSTRATION.

THE pressure on the Porte has within a few days become perceptibly closer. Lord GRANVILLE, with proper reticence, declined to state the instructions which have been given to Admiral SEYMOUR; but he confirmed the statement that something is at last to be done. A squadron to which all the six Powers will have contributed one or more vessels is to assemble within reach of the disputed Albanian or Montenegrin territory. The invitation to the Powers to make use of the port of Ragusa is still more significant, as a proof that Austria, which acts in concert with Germany, has not withdrawn from the European alliance. The recent diplomatic communications have been definite and firm. It was perhaps impossible to avoid some delay in the cession of Dulcigno to Montenegro; but the limit of time which was imposed on the Porte has not been formally altered. At the same time, the Turkish proposal to reopen the Greek negotiations has been peremptorily rejected. The right of the Governments which assembled in Conference at Berlin to compel the surrender of a large territory by one nominally independent Government to another might be plausibly disputed; but, having made the demand, the Powers could not, without a confession both of injustice and of weakness, further prosecute the discussion. The Plenipotentiaries must be assumed to have known all the arguments which can be urged against their decision; and, in fact, they acted on the best professional advice, both in estimating the comparative numbers of the different sections of the population, and in according to either party, as far as the circumstances allowed, defensive military positions which were not equally convenient for purposes of aggression. It is not seriously disputed, except by the Government of the SULTAN, that the Greek population in the district to be transferred anxiously desires a change. It was impossible to draw a frontier line which should not leave a certain number of Mahometans to the south. Rightly or wrongly, the Powers have announced their decision; and it is improbable that they will reopen the controversy.

The naval demonstration, as it is called, is for the present confined to the object of enforcing submission to the provisions of the Berlin Treaty in favour of Montenegro. As there are to be no troops on board the ships, the mode in which coercion is to be applied still awaits explanation; but both Turks and Albanians will understand a display of material force better than diplomatic documents or official proclamations. It is doubtful whether the orders which have been issued from Constantinople are intended to be obeyed; and, even if the SULTAN and Ministers are in earnest, they will not receive credit for sincerity. The Albanians have probably learned that the SULTAN is personally afraid to offend them; and they have cultivated friendly intercourse with the officers who were ostensibly charged with the execution of his orders. The moral claim of Montenegro to territorial aggrandizement is not appreciated by its neighbours. Prince NICHOLAS and his people are rewarded for being orthodox Christians, for hereditary enmity to Turkey, and especially for the diversion which they effected in favour of Russia during the late war. Mahometans and Catholics, whose sympathies are all on the side of Turkey, feel the sacrifice imposed upon them as an intolerable grievance; but the combined squadron will perhaps convince them that it is useless to argue against superior force. The SULTAN will probably be acquitted of readiness to abandon his subjects when the dictation of Europe is embodied in a visible form. It is not to be doubted that the different Governments have pledged themselves to ulterior action if their first practical measure proves to be as abortive as their verbal remonstrances. It is fortunate that there is no risk of maritime collision. The squadron will, for the present at least, not attempt to force the passage of the Dardanelles. Threats are sometimes rendered more effective by ambiguity and calculated mystery.

The technical distinction between the Greek and Montenegrin demands may be not unimportant, if any of the Powers decide to provide themselves with excuses for partial inaction. The demand for the cession of Dulcigno to Montenegro is founded on strict legal right, because it constitutes an agreed modification of the terms of a treaty to which both Turkey and the combined Powers were parties. The Congress of Berlin represented the ultimate authority by which international law is enacted or enforced. As far as the Congress modified the separate Treaty of San Stefano, it gave to the Porte some consideration for the territorial losses which were imposed by the Treaty of Berlin. The refusal of the Porte to comply with any of the conditions of the Treaty would be a lawful cause of war, and it, therefore, justifies less stringent modes of compulsion. The annexation of Epirus and Thessaly to Greece depends on an assertion of superior power and of paramount expediency rather than on any legal right. No cession was required by the Treaty of Berlin, though, in compliment to the French Minister, an informal recommendation was appended to the main instrument. It is, therefore, perhaps open to Germany or to France to decline a share in enforcing the surrender of territory to Greece; but great Powers can seldom tender barren advice or give extra-judicial decisions. The incidental declaration of the Congress might perhaps be explained away; but the unanimous determination of the late Conference must in some sense be binding on all the Governments. It may therefore be probably conjectured that the naval demonstration, if it produces the desired effect with reference to Dulcigno, will be continued or repeated to compel the cession of Epirus and Thessaly. If the means appear not altogether adequate to the desired end, it is not to be supposed that united Europe will allow itself to be finally baffled.

The English Ministers cannot excuse themselves for embarrassment or failure by any impediment offered to their policy by their opponents in or out of Parliament. Both Houses have deliberately abstained from discussing or criticizing the diplomatic and administrative measures of the Government. Lord STRATHEDEN's chronic curiosity and dissatisfaction have been confined to himself; and Lord GRANVILLE's recent statement provoked neither criticism nor any request for further information. It is known that the English Government has taken the lead in all the recent transactions; but its conduct is so far justified by the acquiescence of the other Powers in its proposals; and its objects are generally approved. Even when steps are taken which seem to have a warlike tendency, provisional confidence is reposed in Mr. GLADSTONE's devotion to peace. The country would not tolerate an unprovoked war with Turkey; but as long as the European concert is maintained there is no risk of actual hostilities. If sympathy for a hard-pressed Government and nation has visibly cooled, the SULTAN has himself to thank for the change. His obstinate rejection of the wise counsels which have been tendered through Sir HENRY LAYARD and Mr. GOSCHEN has apparently resulted as much from ill-will to England as from dislike of foreign interference and of administrative improvement. Notwithstanding the surprising declaration of the Turkish Chargé d'Affaires, it is certain that papers have been printed at the Imperial press for the express purpose of promoting disaffection among the Mussulmans of India. There may be some excuses for the SULTAN's

irritation; but his unfriendly conduct naturally provokes resentment. He would readily be forgiven if he would consult his own obvious interest. The Powers which demand unwelcome territorial cessions are indefatigable in contriving for the SULTAN modes of administration by which he might conciliate the loyalty of his remaining subjects. All the Governments have agreed on the reforms which ought to be introduced in Armenia; and the Commission appointed under the terms of the Treaty of Berlin to provide a scheme of administration for the European provinces has already completed its labours. Sir DRUMMOND WOLFF and his successor have taken a principal part in the deliberations of the Commission; and it is stated that Lord EDMOND FITZMAURICE has, with the impartiality which becomes a representative of England, expressly stipulated for the protection of the franchises and customs of the Albanian subjects of the Porte. There is too much reason to apprehend the sluggish resistance of the SULTAN'S Government to all improvement in Europe and in Asia; but it is possible that some beneficial changes may be effected with a conceivable tendency to future development. That Russia should concur with England and other Powers in insisting on constitutional government in Turkey is an anomaly which has already ceased to be surprising.

M. DE FREYCINET AND THE RELIGIOUS ORDERS.

THE season in France has been cheered with a new interest. When the vacation began it seemed as though there would be nothing about which to speculate until the reopening of the Chambers. The elections of the 1st of August promised to make things less exciting than ever. While the composition of the Councils-General remained in any sense Anti-Republican it was always possible to wonder whether the Senate or the Chamber of Deputies best represented France. Both were the offspring of universal suffrage, and any one who chose might argue that the less direct method by which the Senate was elected made it a more genuine, because less special, expression of the national wishes. The Councils-General savoured of the soil. The very fact that they had other functions to discharge besides that of returning the Senate ensured a larger amount of electoral interest, and formed a safeguard against the abstentions which so often vitiate the elections to the Chamber of Deputies viewed as an evidence of French feeling in the largest sense of the term. A deputy might be returned by a minority of political enthusiasts; but a Senator was, in fact, chosen by a body in the return of which the whole electorate had on many grounds a direct and strong interest. Since the 1st of August this source of interest has come to an end. It is useless to weigh these comparative probabilities any longer, because a term has been set to the state of things out of which they arose. The Senate will in future exhibit no sharp distinctions when compared with the Chamber of Deputies. The traditional moderation of an Upper Chamber may still influence its action to some extent; but the general attitude of its members in political controversy will be the same as that of the Chamber of Deputies. The complete success of the Republicans a month ago supplies a decisive answer to the eager predictions of the reactionary parties.

Upon this dead level of political interest M. DE FREYCINET descended the other day in the speech he made at Montauban. M. DE FREYCINET has shown himself in one important respect wiser than any other of his colleagues or opponents. They may keep a newspaper, he keeps a foreign correspondent. Nowhere are M. DE FREYCINET'S praises more eloquently sung than in the Paris Correspondence of the *Times*, and the importance of the Montauban speech was at once trumpeted to Europe in the columns of the great English journal. M. DE FREYCINET, it was pointed out, had read in the elections of the 1st of August the lesson they really had to convey. He saw that the Republic was safe so long as it continued moderate, and he was prepared to apply this knowledge to the case of the unauthorized religious orders. M. DE FREYCINET'S words certainly went far to justify this description of them. He excused the breaking up of the Jesuit establishments as a necessary concession to the feeling of the Chamber of Deputies, and hinted that the other unrecognized orders would be left free to conform themselves, if they chose, to the provisions of a law regulating the right of association which would be introduced next Session. The Correspondent of the *Times* hinted that, in holding out this prospect, M. DE FREYCINET had not spoken without book. As he had no wish to make the relations between the Church and the Government more hostile than they were already, he had taken pains to ascertain whether the religious orders would meet him halfway, and whether the Vatican would countenance them in negotiating a compromise. It now appears that, whether he knew or only prophesied, the *Times'* Correspondent came very near the truth. A declaration has been put out on the part of the non-recognized orders which is nothing more or less than a formal act of adhesion to the existing order of things. The non-recognized orders have, it says, been misunderstood. They have no difficulty in affirming their respect and submission towards the present institutions of the country. They have never claimed to be independent of secular power. "The moral and spiritual aims they "pursue do not permit them to bind themselves ex-"clusively to any one political system." They have nothing to do with political parties and passions, and they must not place themselves at the service of changing causes and human interests. As regards temporal government, they are only concerned to "teach by precept and example "the obedience and respect due to authority, the source of "which is God"; and animated by these feelings they cannot help hoping that the Government will receive their declarations in a kindly spirit, and "allow them "freely to continue the works of prayer, education, "and charity to which they have devoted their lives."

The importance of this declaration must anyhow be great, and may be very great indeed. The coincidence between its appearance and M. DE FREYCINET'S speech can hardly be accidental. The PRIME MINISTER was in all probability not wholly ignorant of its contents when he drew a distinction between the Jesuits and the other non-recognized orders, and bade the latter apply for authorization under the law which is to be brought in next Session. M. DE FREYCINET has justified the predictions which said that he would be a far more moderate Minister than either his friends or his adversaries supposed. He has been content with a declaration which, though it contains everything that a moderate Republican can wish to see in such a document, is hateful to advanced Republicans because it makes the destruction of the orders which adhere to it additionally difficult. It seems impossible that M. DE FREYCINET should say at Montauban that the Government profoundly respects religion, and has only opposed the Church so far as the Church has associated itself with conspiracies against the Republic, and then refuse to take any note of a declaration which presents the religious orders as the dutiful servants of the Republic in all matters which do not touch the specific spiritual labours which they have made their own. There can be nothing gained by giving a distinct assurance one month and falsifying it the next. If M. DE FREYCINET'S object in issuing the decrees against the non-recognized orders was really to bring them to their knees, he has completely succeeded—succeeded, that is to say, in the only sense in which success was ever possible. What more could M. DE FREYCINET expect the religious orders to say than they have said in this declaration? They repudiate all connexion with political parties, all preference for one form of government over another, all identification of the interests of the Church with those of any particular set of human institutions. It is open, of course, to their adversaries to say that these disclaimers are not genuine. But the Minister who has invited them to make such disclaimers can hardly use this argument. He may refuse to enter into any negotiations with bodies whose word cannot be taken; but when once he has entered into them, he cannot refuse to accept the assurances given by the Plenipotentiaries on the other side. Indeed the sacrifices which the putting out of this declaration will entail upon the orders are so considerable as to constitute a very weighty evidence that the declaration is honestly made. It will be universally and justly represented as a surrender, and no one likes to have such a word applied to him. It will be regarded by many persons as a mean desertion of the Jesuits, and though there may be no great love between religious orders, it is not pleasant for one order to be accused, with some show of reason, of leaving another in the lurch, and of accepting favours at the hands of a Government

which has denied the Jesuits bare justice. Nor must it be forgotten that those who will bring these accusations, or at all events will wish to bring them, are the main supporters of the religious orders in France. The declaration will be excessively distasteful to the Legitimists, because it will prevent them from representing the cause of HENRY V. as exclusively the cause of religion. But the Legitimists are the party which has especially befriended the Church. The Bonapartists have been discredited, in their theological character, by the succession of Prince NAPOLEON to the headship of the family. The Orleanists are either Voltairians, or suspected of that liberal Catholicism which, even under LEO XIII., is only half liked by the ecclesiastical authorities. The Republicans are for the most part the declared enemies of the Church. Consequently, the active support which sustains the religious orders in their temporal capacity—which provides them with houses and chapels, fills their schools with pupils, and keeps subscription lists going for the promotion of the objects they have in view—comes with scarcely an exception from the Legitimists. The doctrine embodied in this declaration would have suited ST. PAUL very well, but it can hardly suit the Count of CHAMBORD. The representative of the doctrine of Divine Right cannot care to hear that, in the eyes of the monks and nuns whom his followers are largely supporting, one form of government is as good as another, provided that it leaves the religious orders free to do their own business.

All these questions, however, will at first be subordinate to the question how M. DE FREYCINET's new concordat with the religious orders will be received by his own party. If the *République Française* is to be taken as an accurate interpreter of M. GAMBETTA's views, it will not be liked by the most powerful man in the Republican party. Yet, when it is remembered that a serious breach with M. GAMBETTA — unless it is to result in M. DE FREYCINET's immediate and hopeless fall—must involve the creation of a new Republican party, and its establishment as the dominant power in the State, it seems inconceivable that M. DE FREYCINET should contemplate anything of the kind. Between two improbabilities, it is wise to choose the least; and in this case it is easier to believe that the actual conductors of the *République Française* have been allowed to take their own line than that M. DE FREYCINET has suddenly resolved to measure swords with M. GAMBETTA. At all events, the speculation which of the two theories is the more probable and has most evidence in its favour is quite enough to occupy French politicians from now till the meeting of the Chambers. Until then nothing can apparently be done. M. DE FREYCINET has promised a general law applicable to all associations alike; and, even if he thinks the declaration of the orders insufficient, he can hardly punish them for delaying to apply for authorization until they see what the conditions are to which they must conform themselves in order to be authorized.

THE PRESIDENTIAL ELECTION.

THE contest for the Presidency of the United States, though it is but moderately exciting, may well suggest to Englishmen a feeling of envy. In a season of general prosperity, untroubled with domestic or foreign difficulties, the American people are at leisure to occupy themselves in harmless experiments on the comparative strength of parties. They have no Ireland and no Afghanistan, and their Government and Legislature have neither the will nor the power to disturb the foundations of property, and to cultivate hostility among different classes. The Greenback faction and the Labour League are obscure and powerless, and the two rival parties, of which the main function is to maintain political circulation, are separated by no intelligible difference of principles. General HANCOCK is less popular with his own party than Mr. TILDEN, but he has perhaps a better chance of securing neutral votes. As a soldier he rendered valuable service to the Federal cause during the Civil War; and after its close he administered a Southern military command in a spirit of conciliation and justice. His competitor, Mr. GARFIELD, also bears a high personal character, and he belongs to a class which is greatly esteemed and honoured in the United States. Having in his early youth lived by manual labour, he contrived to educate himself to a level with the dominant class of lawyers and politicians. As a Volunteer officer he acquired credit during the war, and he has since attained a considerable position in Congress. Never conspicuous as a political leader, he became so well known as an adroit party manager that he was entrusted at the Chicago Convention with the care of Mr. SHERMAN's interests. When it became clear that the party leaders were only strong enough to defeat one another, Mr. GARFIELD satisfied the necessary conditions of comparative obscurity and of probable competence. He may probably be as good a President as Mr. BLAINE or Mr. SHERMAN would have been; and he is free from the damaging associations of General GRANT's second term of office.

The contending parties are, not without effort, working themselves up to the excitement which befits the occasion. The smallest part of their duties was to propound the political issues on which the contest is conventionally supposed to turn. The formal Resolutions respectively adopted at Chicago and Cincinnati, and the subsequent letters of acceptance written by the nominated candidates, exhaust the controversy, in which no serious interest is felt. The Republicans are more earnestly devoted than the Democrats to a protective tariff; but, whatever may be the result of the contest, there is no probability of early relaxation. The producers thoroughly understand their own private interests, while the consumers forming the general community are ignorant and disunited. Both political parties have formerly tampered with the public credit; but with the popularity of repudiation, the sophisms of its advocates have fallen into disuse. The Republicans even take credit to themselves for the so-called resumption of specie payments, which really consists in the equalization for the time of the values of paper money and of gold. As greenbacks are still a legal tender, and as they are not compulsorily convertible into coin, it is possible that specie payments might at any moment be suspended. According to law, public and private creditors may be still more effectually defrauded under the Acts which make silver a legal tender; but Mr. SHERMAN has hitherto contrived to thwart the combination of the silver-mine owners with the supporters of repudiation. Notwithstanding the importance of questions which vitally affect the public convenience and prosperity, neither tariffs nor currency will exercise any considerable influence on the approaching election. The two parties are more perceptibly divided on the policy to be followed in the South. The Democrats profess to apprehend Federal interference with State elections; and they announce their determination not to be again defeated by such frauds as those which deprived them of victory in 1876. The Republicans are not less vehement in their demand for freedom of election in the South; but, as may be supposed, they attach a different meaning to the phrase. The Democrats think of the whites, and the Republicans of the coloured voters, who, as they assert, would, if they were allowed to exercise the franchise, return a Republican majority in Florida, in North Carolina, and in one or two other States.

Both parties agree in the calculation that by fair or foul means the Democrats will carry all the Southern States. To return a President they must also obtain forty-seven votes in the North; and it is to secure or frustrate this result that all the efforts of political managers will be directed. Great importance is attached to a State election which is to be held in the course of September in Maine. Notwithstanding the boasted morality of New England, the Greenback faction is stronger in Maine than in other Northern States; and it is feared that the supporters of a depreciated currency may coalesce with the Democrats. Another doubtful State is Indiana, which will accordingly be visited by many itinerant orators abundantly provided with money. It is fair to admit that in American elections there is little or no direct bribery; but enormous sums are spent on delegations and on public meetings. Since the nomination of General HANCOCK, the Democrats have recovered their supremacy in the City of New York, where they were lately defeated in the election of a Governor by the secession of KELLY and his Tammany organization, in consequence of a personal feud with Mr. TILDEN. KELLY has now promised to return to his allegiance as a Democrat, though he is supposed to resent the leading part which Mr. TILDEN takes in promoting the candidature of General HANCOCK. The Republicans fear that the City will carry with it the State, but they still profess to be confident of the support of the rural districts.

Ohio, which was not long since doubtful, is believed to be secured to the Republican cause by the choice of two citizens of the State in succession as Republican nominees for the Presidency. It appears that no doubt is entertained of the fidelity of other Northern States to the Republican cause. On the whole, the chances of the competitors seem to be unusually even. As every citizen of the United States thoroughly understands the personal and political issues of the contest, it might be supposed that agitation and oratory would do little to affect opinions or votes; but election managers, who must be supposed to understand their business, cherish a traditional faith in the efficacy of crowded meetings and of vehement speeches.

The Republicans, being richer or more liberal than their adversaries, boast that they have collected a million of dollars, and begun to spend them, before the Democrats have commenced their operations. The party in power has a great advantage in its power of levying a contribution from every member of the Civil Service, for official persons are compelled to pay or to forfeit their appointments, and they are perhaps partially reconciled to the extortion by the knowledge that their tenure of office depends on a Republican victory. As the importance of a race depends on the amount of the sweepstakes and of the added money, a Presidential election derives much of its interest from the eighty thousand salaries which are staked on the result. On the other side, Democratic aspirants to office will perhaps subscribe to the election funds; but voluntary contribution is never as productive as a regular tax. A late meeting of two hundred and fifty Republican leaders at New York discussed and settled the general arrangements of the canvass. The party will probably abide by the decisions of the meeting, though Mr. CONKLING was significantly absent. Representatives of some of the Southern States implored the principal orators of the party to visit their districts for the purpose of encouraging the coloured voters; but the managers summarily rejected the proposal, having probably satisfied themselves that their eloquence would produce no impression on the vote of any Southern State. They preferred to employ their energies in Maine and Indiana, which will accordingly be gratified by torrents of oratory. In accordance with laudable custom, Mr. GARFIELD, though he was in another part of the same building, took no part in the discussion. On his journey to New York, though he was received at the stations with as much apparent enthusiasm as if he had been Mr. GLADSTONE travelling on an English or Scotch railway, Mr. GARFIELD observed the same commendable reticence. It seems that, in the most fluent and voluble of communities, silence is the privilege and duty of the highest. The professed orators on every occasion presented the Republican candidate to the audience, and then proceeded to speak on his behalf. General HANCOCK will also be represented by the proper staff of delegates and committees; but his principal adviser, representative, and manager, is the astute politician to whom he was preferred at Cincinnati. Mr. TILDEN finds a difficulty in diverting from himself the enthusiasm and applause which are officially due to the comparatively unknown nominee.

THE EMPLOYERS' LIABILITY BILL.

THE Employers' Liability Bill has throughout its career met with extremely hard usage. It is quite true that it was very far from being a well-drawn Bill. It was selected as one of the measures which there seemed most likelihood of getting through Parliament in a broken Session, and it was too hastily assumed that when a sound principle had been discovered on which to base it the details would somehow settle themselves. In the House of Commons it was more unfortunate in its supporters than in its opponents. No one man has done so much to imperil its success this Session as Mr. GORST. In dealing with a measure which is avowedly one of compromise, exaggerated friendship is just as dangerous as declared enmity. Either way the result is to threaten the maintenance of the compromise, and with that goes the justification of the particular Bill under discussion. If the Conservatives who wished to see the plea of common employment altogether done away with had carried their point, the Bill must inevitably have disappeared. If the Government had not withdrawn it in consideration of the contradiction which in its amended form it presented to their declarations when introducing it, the employers in one or other House would certainly have been able to defeat it. The "Fourth Party" might not have been displeased at this result in either of the characters which it has lately pleased them to assume. Such enthusiastic friends of the working-man are naturally disposed to think no bread better than half a loaf, and such conscientious obstructives could not but have rejoiced at adding one more measure to the list of Ministerial failures. The extent to which the Bill steers clear of extreme views on either side has not been sufficiently appreciated. Notwithstanding the ingenuity in high places which has been spent in showing that employers would gain if the plea of common employment were altogether abolished, neither the injustice nor the imprudence of such a step has been disproved. If anything could make employers utterly careless about preventing accidents, it would be a law which made them equally answerable for accidents which they might have prevented and for accidents which it was out of their power to prevent. When the innocent and the guilty have to put up with a common penalty, the force of the inducement to remain innocent is indefinitely decreased. In point of fact, so far as the law is concerned, the inducement altogether disappears. With the plea of common employment done away with, conscientious and kindly employers would still be careful of their workmen; but employers who were neither conscientious nor kindly would have really no motive for being careful. Hitherto something of the same result has been arrived at by an opposite road. Whether the employer is careful or careless he has been equally free from liability. When the judges determined that an agent picked out after the most careful scrutiny, and a labourer taken on that morning because there was a job to be done and he was there to do it, stood on precisely the same footing as regards their employers' liability for their negligence, the employer had no longer any reason for inquiring whether those to whom he delegated his authority were as likely to be careful of workmen's lives as of employers' pockets. Between these two extremes the head of the Bill was originally pointed; and, on the whole, its course has been pretty steadily steered in the same direction.

The principal change which the Bill underwent in the House of Lords was the omission of the subjection which makes an employer liable for an injury caused by the "negligence of any person in the service of the employer "to whose orders or directions the workman at the time "of the injury was bound to conform and did conform." It is possible that experience may show that these words are too comprehensive. The case of a hodman who sustains an injury while carrying out the orders, not of his employer, but of the bricklayer whom he was supplying with materials, was instanced by Lord CARNARVON; and, if such a case should be held to come under the Bill, it may hereafter be found necessary to amend it. But the time of the House of Lords would have been better employed in rendering the Bill this service than in striking out the clause altogether. It may not be clear enough that the "orders or directions" to which the workman at the time of the injury was "bound to conform" are really the orders and directions of the employer himself—orders and directions, that is to say, given by agents who have been chosen among other things for the purpose of giving orders and who have been negligent in giving them. But, in the absence of an improved definition of the persons really contemplated by the clause, the House of Commons had really no choice but to disagree to the amendment. An agent to whose orders a workman is bound to conform is, from the workman's point of view, his employer. He is as much bound to obey his orders as though they came from the employer himself, and the employer is consequently bound to be just as careful in choosing him as he would be in determining what orders to give if he were himself giving them. If there is any defect in the clause, it lies, not in the relation it creates between agent and employer, but in its definition of what constitutes agency. As it stands, however, that definition embodies the best wisdom of the House of Commons. That wisdom might, in this instance, have been usefully supplemented by the Lords; but they were clearly ill-advised in omitting the clause altogether. An Act which did not make employers liable for the negligence of agents to whose orders the workman injured was bound to conform would have been obviously, and even ludicrously, incomplete. The fact that a workman

may sometimes be bound by the necessities of his employment to conform to the orders or directions of some one who is simply a fellow-workman, and not in any genuine sense an agent of the employer, would have been a good reason for altering the wording of the clause; but it was not a reason for refusing to deal with that large number of cases in which the man who gives the orders is undoubtedly the agent of the employer, and acting as such in giving the orders.

The substitution of seven years for two in the duration of the Bill is not an improvement. We fail altogether to see any good reason for the introduction of such a limitation in any shape; but, if the Government were of opinion, as they might very well be, that it was expedient to make some arrangement with the Lords, and not simply to undo their work, it would have been better to accept the limitation in the form given to it in the other House. The preponderance of argument is decidedly in favour of the shorter term. As the Bill would necessarily have had to be re-enacted two years hence, the subject would have been kept well before the minds of the Government, and they might have really busied themselves in ascertaining what amendments might profitably be introduced into the Act the Session after next. In point of fact, during the interval between 1880 and 1882, employers and workmen would have constituted an informal Select Committee, by whose labours a large body of evidence, as to the present and prospective working of the law, would have been got together with much profit to those who would have had to legislate on the question once more in two years' time. An interval of seven years has not this advantage. For purposes of amendment the passing of the Bill will be regarded as final. Nobody will trouble himself to draft suggestions which will stand no chance of being considered till 1887. At the same time, the fact that the Act is in form only a temporary measure will tend to unsettle all who have to do with it. On both sides there must be a good deal of concession if the new order of things is to work satisfactorily. The employers as a body would have wished to see no change made in the law. They have always contended that no addition to their liability was needed to make them careful as regards avoidable accidents, and that the addition which the Bill makes will virtually render them liable for unavoidable accidents. The workmen as a body have contended that no exception ought to be made to their disadvantage in the ordinary law which holds an employer liable for the acts of his servants. They would have wished, in fact, to see the liability of employers for injuries inflicted on workmen made co-extensive with the liability of employers for injuries inflicted on strangers. The best chance of bringing both sides to acquiesce in a compromise which in the nature of things can be grateful to neither is to make it appear that the settlement effected by the measure is meant to be final; but with a re-enactment of the law made imperative in seven years the idea of finality is wholly excluded. Why Mr. DODSON should suppose that the next Parliament will be better fitted than the present to deal with a new Employers' Liability Bill is not clear, unless indeed he cherishes the hope that by that time obstruction will have fallen into disuse, and the "Fourth "Party" have once more submitted to the restraints of ordinary leadership. If this was his motive for lengthening the time between enactment and re-enactment, it is sincerely to be hoped that his glance into the future will prove prophetic. Should it do so, the credit he will gain by his prediction will be all the greater from the entire absence of any data on which to found it.

THE SESSION.

THE new Parliament met for the despatch of business on Thursday, the 20th of May. It consisted of 350 Liberals, 240 Conservatives, and 60 Home Rulers. All the members of the Ministry whose seats had been vacated by taking office had been re-elected with the exception of Sir William Harcourt; and Mr. Gladstone was present in the freshness of his vigorous old age to discharge the duties of a leadership which had been forced on him by the general conviction that, if he was to exist in the political world at all, he could hold no other place than the first. The Queen's Speech announced that the Government intended to pursue a foreign policy based on getting all the Great Powers to act in concert, so as to secure an early fulfilment of the Treaty of Berlin, to promote effectual reforms and equal laws in Turkey, and to settle all territorial questions. In Afghanistan it was proposed to establish so soon as circumstances would permit an independent and friendly Power with suitable institutions, and early information was promised on the weighty subject of Indian finance. The supremacy of the Crown was to be maintained in the Transvaal, while free institutions were to be secured to the European settlers. The state of Ireland was said to be such that the ordinary law would suffice to secure order, and a renewal of the Peace Preservation Act was therefore unnecessary. The Government measures of the Session were to be a Bill for the relief of Irish distress and a Bill for the assimilation of the Irish to the English borough franchise, a Burials Bill, an Employers' Liability Bill, a Ground Game Bill, and a Bill for renewing the Ballot Act. It seemed a modest programme, and not disproportionate to the powers of Parliament in a Session that it was assumed must be short. Nor did it receive much criticism in either House. No one could openly object to the Government endeavouring to carry out the Treaty of Berlin; and the exact meaning of the foreign policy announced was so vague that the mover of the Address admired it as a policy of wise intervention, and the seconder used it as a text for proclaiming his antipathy to all intervention whatever. It was generally acknowledged that, if the Government was going to take a new departure in regard to Turkey, it was right in sending a special Envoy to Constantinople, and that no choice could have been better than Mr. Goschen. Mr. O'Connor Power attempted in the discussion of the Address to force the new Chief Secretary for Ireland to take up the Irish land question as the really pressing question of the day. But Mr. Forster answered, with much good sense, that the Government must have time to study so large and complicated a question as that of the tenure of land in Ireland, and that any hurried Bill on this question, even though confined to the subject of temporarily suspending evictions, would be a great mistake; and even Mr. Parnell, who was appointed by the Home Rulers to supersede Mr. Shaw as their Sessional Chairman, owned that the Government must have time given it if it was to bring in an Irish Land Bill on a satisfactory scale. It cannot be said that Government started badly. There was some Protestant murmuring outside Parliament against the appointment of a Catholic to the Viceroyalty of India; but it found no echo within Parliament. Sir William Harcourt was soon provided with a seat, Mr. Plimsoll being moved by nothing less than direct inspiration to create a vacancy for him at Derby. The Conservative leaders assembled in a formal meeting when Lord Carnarvon returned to their ranks, and Lord Beaconsfield exhorted them to be patient, prudent, and very attentive to the organization of the party in the constituencies. Some criticism was bestowed in the House of Lords, and more outside, on Mr. Gladstone's letter to the Austrian Ambassador, which was generally thought to be too humble an apology, and was pronounced by Lord Salisbury to be no apology at all; and the new foreign policy was denounced by the late Foreign Secretary as reposing on the ridiculous notion that the performers in the European orchestra could ever be brought to play the same tune. But time alone could show how the European orchestra would play.

But a cloud soon rose on the Parliamentary horizon. It was a cloud that had begun to show itself even before the Session was formally opened. Northampton had thought proper to return the terrible Mr. Bradlaugh, and when it came to his turn to be sworn in he stated that he had a conscientious objection to take the oath, the appeal to the Deity being to him unmeaning, and asked to be allowed to affirm. He might have been allowed to take this step at his own risk, and to the great advantage of the Ministry and of the House, had it not been for the apparently accidental intervention of Sir Drummond Wolff, who raised the objection that he was not entitled to affirm. The point at issue was a strictly legal one, and turned on the interpretation of an Act of Parliament. It was doubtful whether the Act meant that any person not wishing to take the oath might affirm, or whether only persons falling under the specified head of witnesses in a law court, under none of which Mr. Bradlaugh was included, might affirm. Lord F. Cavendish moved that the question should be referred to a Committee, and Sir Stafford Northcote seconded the motion. It was natural to suppose that a motion countenanced by the leaders of the Government and the Opposition would meet with no opposition. But Sir Drummond Wolff and Mr. Gorst, who even at that early date began to show their independence of their nominal leader, did their utmost to prevent the Committee being appointed. It was, however, appointed, and, by the casting vote of the chairman, Mr. Walpole, reported that Mr. Bradlaugh could not legally be admitted to affirm. Immediately after the Session had been formally begun Mr. Bradlaugh, not contesting the decision of the Committee, asked to be allowed to take the oath. There could be no doubt that if in the first instance Mr. Bradlaugh had been willing to take the oath no one could have stopped him; but he himself had stated in the House, and therefore directly to its knowledge, that he did not wish to take the oath because part of the form was to him unmeaning. Whether the competence of Mr. Bradlaugh to take the oath under these circumstances was a legal question or not was very doubtful. But Mr. Gladstone insisted that it was, and that it must be referred to another Committee. This gave rise to a heated and protracted debate, the Opposition, not without a great show of reason, insisting that the House must be competent itself to decide whether an oath could be taken by a member who had informed the House that the special sanction of the oath had no meaning for him. A majority of 75 supported Mr. Gladstone,

and a Committee was appointed, which reported, after hearing Mr. Bradlaugh himself, that the oath could not, under such circumstances, be taken. This was precisely what might have been expected; but what no one could have expected was that the Committee altogether strayed out of its province, and recommended that the conclusion of the former Committee should be summarily set aside, and that Mr. Bradlaugh should be allowed to affirm. This was entirely out of the province of the Committee, but it seemed to give an opening for putting an end to the controversy, and Mr. Labouchere moved that Mr. Bradlaugh should be allowed to affirm. Sir Hardinge Giffard moved as an amendment that Mr. Bradlaugh should not be allowed either to take the oath or to affirm; or, in other words, that the conclusions of the two Committees, so far as they had dealt with matters within their province, should be upheld. Two long nights scarcely sufficed for a debate in which the whole weight of the Government was used in support of allowing Mr. Bradlaugh to affirm. But the Government was beaten, and a month after he had begun to lead the Parliament that seemed entirely his own, Mr. Gladstone found himself in a minority of 35. The next day Mr. Bradlaugh asked to be heard, and was heard, but failed to influence the decision of the House; and, on his refusing to withdraw, was, on the motion of Sir Stafford Northcote, ordered into custody. Mr. Gladstone, having been defeated, refused to act in the matter at all, and on the following day it was Sir Stafford Northcote who proposed that Mr. Bradlaugh should be discharged. As it was certain that he would not apologize, he was discharged without being called on for an apology; and, as it was also certain that he would again present himself, the Government was forced to propose some fresh course. Mr. Gladstone accordingly invented a new motion, which technically avoided the objection that it was in contravention of the former decision of the House, as it was proposed, not that Mr. Bradlaugh, but that any one who objected to take the oath, should be allowed to affirm. There were grave objections to this proposal, as it left it to the courts of law to decide a point which the report of the first Committee pronounced to be in the competence of the House, and as it was made retrospective so as to include Mr. Bradlaugh, it did in effect contravene the decision of the House that Mr. Bradlaugh should not be allowed either to take the oath or affirm. Its only merit was that it temporarily disposed of a very unpleasant matter, and was carried by a majority of 54; but it is obvious that, if this was a proper course for the House to take, it ought to have been taken at the outset, and then a lamentable waste of public time and much angry discussion would have been avoided.

Before this matter had been brought to a conclusion, a fresh and most unexpected occasion for criticism of the management of the House by the Government had presented itself. M. Challemel-Lacour had been appointed by the French Government as its English Ambassador, and Mr. O'Donnell thought proper to make a violent attack on the new Ambassador in the form of asking questions as to the previous history of M. Challemel-Lacour. They were questions which ought never to have been asked, and to which it is extremely doubtful whether any answer should have been given. But as there was a very good answer to be given, the Government considered it advisable to say openly that the charges made against M. Challemel-Lacour were unfounded, rather than that the new Ambassador should begin his official duty in England in the unpleasant position of a person who had been accused of assassination and robbery, and whose conduct had never been explained. Far from being satisfied with the answer he had obtained, Mr. O'Donnell got up and proceeded to reiterate his charges in a long and violent speech. The Speaker was appealed to, and pronounced that Mr. O'Donnell was technically in order, but stated that it was a very grave abuse of the privileges of a member to make such a speech, and he put it to the House whether the course taken by Mr. O'Donnell was a course the House would sanction. Mr. O'Donnell went on with his speech, and then Mr. Gladstone rose and moved that "Mr. O'Donnell be not heard." No such motion had been made for two hundred years, and it was in fact a complete Parliamentary novelty, and a novelty open to the most serious objections. Instantly the debate took a new form, and for hours the question was keenly discussed whether this startling innovation was to be accepted. Even the wildest Irishmen disclaimed complicity with Mr. O'Donnell; but every section of the Opposition protested against so alarming an interference with the freedom of debate. It was quite true that Mr. Gladstone was the last person who could be expected to have really any wish to limit debate unfairly, and he was only acting in response to the appeal of the Speaker. But the precedent he was endeavouring to create was of much wider application than was warranted by the circumstances. It seemed to lay down the startling doctrine that any member might move that any other member be not heard, and thus not only might every one in turn be silenced, but the business of the House would be brought to an utter standstill. The debate was not conducted with any violence of party spirit, and some Conservatives of great Parliamentary experience supported Mr. Gladstone. It was evident that what the House wanted was that Mr. O'Donnell should be stopped, and yet that a bad precedent should not be created. Ultimately this was accomplished, Mr. Gladstone withdrawing his motion, and Mr. O'Donnell confining himself to giving notice of a motion to be made on a future day. When Mr. O'Donnell attempted to put his views on paper, the Speaker held them to be for the most part not such as could be put, and so the matter ended. The character of M. Challemel-Lacour was vindicated, and he has since been well received in England. No dangerous precedent was set; but there was a painful impression created that the Government under Mr. Gladstone's leadership was inclined to propose heroic remedies on the impulse of the moment without due consideration of inevitable consequences.

This impression was soon strengthened by the course which Mr. Forster took with regard to Irish eviction. He suddenly announced that he would introduce into his Irish Relief Bill a clause giving compensation for disturbance to distressed tenants evicted for non-payment of rent. He appeared to be unable or unwilling to see that he was not doing a little thing but a great thing, and was raising the large question of Irish land which he had promised not to touch during the Session. When this was sharply pointed out to him, he was driven to take his clause out of the Relief Bill, and bring in a separate Bill with regard to eviction. His Relief Bill thus lightened was got through, although the House had to sit into Sunday morning to get it through Committee, and the Railway clauses had to be given up in deference to the wishes of Mr. Parnell and his friends. But the Compensation for Disturbance Bill met with a violent and protracted opposition. Lord Lansdowne resigned on account of his disapproval of the Bill, and most of the representatives of the great Whig landowners in the House of Commons either voted against the Bill or abstained from voting. The Ministerial majority was, however, large enough to ensure support to the Government on every division; but the Ministry was evidently very much puzzled how to present its measure and how to defend it. It was at different times defended as the only means of averting civil war, as the development of a germ in the existing Land Act, as the restoration of the Land Act to the form it assumed when it left the House of Commons, as in accidental harmony with French and Scotch law, as a proper check on harsh landlords, and as a measure that scarcely touched landlords at all, as they had remedies sufficiently powerful left in their hands. The statistics on which the measure was supposed to be based were successfully criticized. It was shown that proceedings threatening eviction had been mixed up with evictions, and that the policemen said to be engaged in enforcing the law had been multiplied by the simple process of counting the same men over and over again. It was also shown that the Bill would apply to nearly half Ireland, while in only about a tenth of Ireland was there at the time any real distress. The Government kept shifting its ground. It announced that it would accept an amendment, to be proposed by Mr. Law, that the Act should not apply where the tenant had been allowed to sell his interest. Mr. Parnell objected that this would do no good, as many distressed tenants had at best something that no one would buy, and there was the further objection that, under the Land Act, the tenant who did not pay rent had no interest to sell. Mr. Gladstone therefore dropped Mr. Law's amendment, and substituted one providing that in case the tenant offered terms then the Bill was to apply, if the landlord refused those terms without giving a reasonable alternative. This was vagueness itself; but it was inevitably vague because the Government had not really made up its mind as to what was the true position of the tenant under the Land Act, or what ought to be his position under a new Act. Everything was to be left to the discretion of a County Court judge, who was supposed to be able to solve every puzzle that had baffled the Legislature. In every direction it became apparent that the Government was plunging into difficulties that it ought to have avoided, because it was doing exactly what it had said it would not do, and was dealing with Irish land before it had had time to examine how Irish land ought to be dealt with. Mr. Chaplin pointed out with great force that, as the measure was said to be one specially intended for distressed people, it could only properly apply to those who were distressed, because they had very small holdings. The Government owned that there ought to be some limit, but they would not hear of the limit being fixed so that only holdings of 15*l.* and under should be included in the scope of the Bill, or even of 30*l.* being taken as the limit on the precedent of the Land Act, and ultimately fixed it at 45*l.* In the Commons the Government would have its way, and had it; but the fate of the measure was sealed when it came before the Lords at the beginning of August. The Ministerial speakers felt they were arguing a hopeless cause, and in Lord Derby and Lord Emly they had two non-official supporters, who agreed that the Bill was as absurd and bad as a Bill could be, but who urged that the prudent course to take was to read the Bill a second time and cut it to pieces in Committee. Lord Lansdowne and Lord Dunraven stated the case of the landowners with moderation, tact, and ability, and Lord Cairns in a masterly speech summed up every objection to the Bill that ingenuity could devise. When the division was taken it appeared that only 51 peers supported the Bill against 282 who opposed it, and that, putting aside the Conservatives, there were more Liberal peers who voted against the Bill than there were Liberal peers who voted for it.

It thus happened that June and July had passed away, and the great bulk of the work the Ministry had set before it was scarcely touched. The Irish Relief Bill had passed through the Commons and was unopposed in the Lords, and the Lords had got through the Burials Bill, the only Government measure begun in the Upper House. As both Archbishops and eight Bishops supported the Bill, Lord Beaconsfield announced on the third reading that it was useless at that stage for lay Conservatives to be more tender of the interests of the Church than the episcopacy had shown itself to be. The Lords rejected an amendment exempting from the operation of the Bill churchyards given in recent times by private donors, but adopted an amendment directing that Dis-

senters should be only buried in churchyards where there was no cemetery with unconsecrated ground available, and another forbidding burials of Dissenters in churchyards on Sundays and the great days of the year in the Church's year-book. Lord Selborne insisted that the service must be an orderly and Christian one, and some concessions, borrowed almost at random from suggestions of Convocation, were embodied in the Bill with the view of consoling clergymen for the Bill by very partially relieving their consciences. It was not until August 12 that the Commons had time to pay some attention to the Bill, and the second reading was carried by an overwhelming majority, and the only important change made in Committee was the excision of the clause inserted in the Lords providing that the Act should not apply in parishes where there was ground provided other than the churchyard in which Dissenters could be buried. There remained among the measures announced in the Queen's Speech, the Irish Franchise Bill, which the Government decided to abandon; and the Ballot Bill, which they determined to include in the ordinary continuance Bill. This was of course not the mode in which it was proposed to deal with the Ballot when the Queen's Speech was framed, and thus it may be said that two of the Ministerial measures were abandoned. Two remained, and although the time had now come when Parliament is ordinarily relieved from any further serious work, it was resolved to go on with these two remaining measures. One was the Employers' Liability Bill, and the history of this Bill is one of the most curious episodes in the chronicle of the Session. The Government started to legislate on a very important subject without having any Bill at all ready. They actually carried the second reading of a Bill which was no Bill at all, and which was to have all its inside put into it in Committee. There was much opposition to the proposals of the Government as soon as it was seen that they had anything to propose; many Liberals objecting that the measure would be ruinous to employers, and some Conservatives asking that the doctrine of common employment should be altogether discarded. Attempts were also made to get compulsory or general adoption of insurance substituted for the system of compensation which the Bill was to introduce; but the Government got its measure through the Commons very much in the shape it desired, and adhered to the sound principle that employers should only be liable for accidents sustained by workmen when those accidents were caused by the negligence of agents for whose appointment the employers were distinctly responsible, and it was by a wide, but perhaps permissible, extension of the preamble that the guards, drivers, pointsmen, and signalmen of railways were expressly numbered among such agents. At last the Bill passed through the Commons, and the Lords began to discuss it on the 24th of August. An amendment was carried by Lord Brabourne relieving employers from responsibility for the acts of their sub-agents, and thus greatly limiting the operations of the Bill; and Lord Beaconsfield, to show that the Bill was only to be regarded as an experiment, induced the Lords to limit its operation to a period of two years.

The Ground Game Bill was pushed through the House of Commons as rapidly as possible after the Employers' Liability Bill was out of the way. Although it naturally excited much opposition, it was accepted without a division on the second reading, and was supported by a small portion of the Conservative party. It was avowedly an interference with freedom of contract, and was only justified by the evil consequences of an abuse of the right to preserve game which is not very frequent. But the tenants gave considerable evidence that they wished the measure to become law, and the Ministry had been too largely helped by tenants at the recent election not to wish to please its new friends. So many good landlords, too, owned that, although they disliked the Bill, yet it only embodied something like the arrangement which had long prevailed on their estates, that it seemed plausible to say that, after all, the Bill only imposed a good custom in a harsh manner; and during the debate Conservatives seemed to be annoyed not so much with the Bill itself as with the manner in which it had been introduced and defended. It certainly seemed hard on the landlords that because they wished to be at liberty to make their own arrangements with their tenants as to hares and rabbits, they should be denounced by Mr. Bright as the persistent enemies of their country. This Bill, like the one just referred to, underwent serious modifications in the Upper House.

The Government has also managed to carry some measures of minor importance. It would not abandon the legislation on which it relied to give it an assurance of its own activity. Two Bills regulating the wages of seamen, a Bill to limit grain cargoes, a Bill to facilitate the currency of small Post-Office orders, and a Bill to assure the State against losses by Savings Banks were among these achievements. But much the greatest Ministerial success of the season was the Budget. Sir Stafford Northcote had left a Budget which Mr. Gladstone took over; but this Budget only showed a small surplus, and not a very sure one. This gave Mr. Gladstone an occasion for introducing a very considerable financial scheme. He invited the House of Commons to do three things—to ensure a large surplus; to abolish the Malt-tax, a beer-tax being substituted; and to authorize him to negotiate with France for a new commercial treaty on the policy of the reduction of the English wine duties. This last part of his scheme had to be abandoned or deferred, as it was found that France was not ready to negotiate. But Mr. Gladstone insisted on his surplus, which he got in a great degree by a new licence duty on public-houses, and he got the Malt-tax abolished. Its abolition would, it was estimated, cost in ready money more than a million sterling, which would have to be repaid to the maltsters; and Mr. Gladstone got this sum, and more than this sum, by adding a penny to the Income-tax. It seemed hard that Income-tax payers should alone furnish a sum which was paid for the benefit of taxpayers of all classes; and the brewers raised innumerable objections, to some of which Mr. Gladstone listened, as to the proposed mode of imposing the Beer-tax. But Mr. Gladstone was all-powerful. If the electors had not given him power to deal with finance, why could they be supposed to have cried out for him? The new Budget was carried almost without criticism, simply because it was Mr. Gladstone's Budget. The farmers had been for years clamouring for the repeal of the Malt-tax, and Mr. Gladstone wished to gratify them; and he escaped from the reproach that he was now recommending what he had invariably opposed by the ingenious discovery that the number of private brewers had so much decreased that it was now possible, while previously it had been impossible, to manage the working of a Beer-tax. Whatever Mr. Gladstone said was accepted, and it was accepted the more readily because the public saw that he had a distinct financial policy, a policy different from that of the late Government, and a policy which it seemed fair should be tried in its turn, the policy of upholding the national credit by providing a substantial surplus, and of making each year bear its own charges.

The foreign policy of the Government has occupied little of the attention of Parliament. At an early period of the Session Mr. Gladstone explained to Sir Stafford Northcote that it was not the desire of the Government to use force to Turkey, that he hoped to effect the objects he desired by bringing the pressure of United Europe to bear on the Porte, and that at the same time he hoped to convince the Turkish Government that England had no interest in the preservation of the Turkish Empire in Europe beyond what other Powers had, and certainly had no designs of special interference in Asia Minor. The sufferings and wrongs of the Armenians were brought to the notice of the Lords by Lord Carnarvon and to that of the Commons by Mr. Bryce, and no one could have shown himself more alive to the disgraceful misrule of Armenia than Lord Salisbury; but he urged that there was no practical remedy except the slow and uncertain action of consular reports, while the Government considered that it had a weapon of redress in the concert of Europe. Even now it is impossible to say whether the policy of the Government promises to be successful or not. The concert of Europe has been maintained, but it has not led to any practical result. The condition of Cyprus was discussed in the House of Commons, and Sir Charles Dilke announced that the new Ministry had no change to suggest except the acceleration of the transfer of Government to the Colonial Office; and he ventured to say what had been so much derided when said by the last Ministry, that the Ministry hoped to show the Turks how well a portion of the Turkish Empire could be governed. Nor has India occupied so much of the time of Parliament as might have been expected. Lord Hartington easily disposed of a motion deploring the opium traffic, by remarking on the cheap morality which proposed to disturb Indian finance without burdening English moralists with the task of supplying the deficit. He read a carefully drawn memorandum, in which he stated that Cabul would be evacuated with all possible despatch, that military experts would be consulted as to how much of the scientific frontier it would be wise to retain, and that the future of Candahar must be left for the present undecided. When the defeat of General Burrows by Ayoub Khan became known, and it was announced that Sir Frederick Roberts was to march to Candahar from Cabul, with the flower of the Cabul army, Lord Hartington contented himself with replying to his military critics, that the enterprise had been recommended by the highest local military authorities, and that the Government had merely abstained from interfering with the decision of those who staked their professional reputation and possibly their lives on the event. When at a late date and after repeated delays the Indian Budget came under discussion, Lord Hartington, in a speech of great force and untinged by party bitterness, said that even then he could not say what had been the real history of Indian mismanagement; that it was evident that, although the higher Indian financial authorities must be altogether freed from any suspicion of dishonourable concealment, yet they had fallen into a mistake which they might easily have corrected, and that, although the Indian revenue had shown in the last three years a very great surplus, and could probably bear without much difficulty the whole cost of the war, yet that in justice England must bear a share of a war waged in part at least for other than Indian purposes. How great this share ought to be he could not as yet say until he knew what the cost of the war would be. His hearers might differ from Lord Hartington, but they could find nothing to resent in what he said, and the general impression he has produced is that the Government of India is in firm and just hands. The course adopted by the Government to Sir Bartle Frere has not been equally free from reasonable censure. The Government was strongly pressed by some of its more advanced supporters to recall Sir Bartle Frere directly they had the power to show that they really meant as Ministers what they had said as leaders of the Opposition. This might have been a justifiable treatment of a public servant, although the better doctrine seems to be that when a public servant has made a mistake, and his mistake has been formally condemned by Parliament, no further reference to it shall be made. But the

Government, equally unwilling to recall Sir Bartle Frere and not to recall him, hit on a most unfortunate and unfair compromise. To avoid discussion, it knocked off the High Commissioner's Parliamentary salary, and it announced that while it thought him generally unfit for his post, it also thought he might be useful in bringing about Confederation. When he failed through no fault of his in getting the first step toward Confederation taken, he was informed that the Government found it impossible that he and it should get on any longer together, and he was recalled; and thus in the end the Government had neither the credit of acting up to its own views as to the Zulu war, nor the credit of supporting a public servant who, while the present Ministry had been in office, had given no cause of offence.

The innovating tendency of the new Parliament was shown by Mr. Hinde Palmer's Bill for giving the widest latitude to the pecuniary independence of married women and a Bill for the Welsh closing of public-houses on Sunday being read a second time without a division, and by Sir Wilfrid Lawson at last securing a majority for his beloved Local Option. Nothing further was heard of these measures, but that their supporters should have had so easy, although an ineffectual, triumph is worth observing. For once the House enforced the doctrines of a strict political economy by rejecting a scheme for giving to Irish fisheries through a large subvention an existence they cannot secure on their merits. An attempt was made by Mr. Roundell, Mr. Story Maskelyne, and Mr. Bryce to induce the House to pronounce against clerical heads of houses and clerical Professors of Hebrew and Church history in the Universities of Oxford and Cambridge; but Mr. Gladstone successfully interposed with the objection that it was not for the House to dictate to the Commissioners appointed by the whole Legislature, and still sitting, what should be their conclusions. Neither the influence of Mr. Gladstone, however, nor that of Sir Stafford Northcote sufficed to keep the House from recording its protest against the erection of a monument in Westminster Abbey to the Prince Imperial; but the House wisely kept clear of anything like special antagonism to the Napoleon family, and suffered itself to be guided by Mr. Beresford Hope into the safe path of declaring that Westminster Abbey is a national burial-place, and ought to be reserved for the exclusive honour of English worthies. One private member has actually got a Bill through both Houses; and Mr. Dillwyn has signalized himself by throwing a new spell of protection over British birds. In the Lords, a Bill for legalizing the marriage of a deceased wife's sister was thrown out by a majority of eleven, although royalty again showed its open patronage of the only Bill in which it suffers itself to show a deep interest. The Lords also voted an Address in which the Crown was asked to suppress the Fourth Schedule of the Education Code; or, in other words, to check the provision for elementary education being used to promote higher education. A preliminary discussion on the subject, in which Lord Norton, Lord Sherbrooke, and the Bishop of Exeter had taken one side, and Lord Spencer and Lord Aberdeen the other, had made it clear that the issue was whether the system of elementary education was impeded, as the first set of speakers contended, or promoted, as the second set asserted, by the addition of higher instruction. Why the Duke of Richmond took in Opposition a line exactly the contrary of what he had taken in office was not so intelligible.

During the greater part of the Session election petitions have been in course of hearing and decision. In one Irish case the judges differed, but otherwise the results arrived at were so obvious that no great advantage appeared to be derived from the subtraction of double the number of judges from the ordinary business of the Courts. There was little party gain in these contests. Both parties suffered, and both retained with nearly equal success the seats they lost on petition. The decisions of the judges made three things clear—that a very innocent candidate may be unseated for some trifling indiscretion of an agent; that there was a startling amount of corruption, not only in some small boroughs, but in places so ancient and so important as Oxford, Gloucester, Chester, and Canterbury; and that the ballot has been the means of introducing some new refinements of malpractice. One curious point arose which attracted the attention of the House. Mr. Dodson was elected for Chester at the general election, vacated his seat on accepting office, was re-elected, was unseated on petition, accepted the Chiltern Hundreds, and was elected for Scarborough. The question arose whether it was proper to grant Mr. Dodson the Chiltern Hundreds under the circumstances, as to which Mr. Gladstone explained that it was only done through superfluity of caution to make it clear that Mr. Dodson was no longer in any sense member for Chester; and there was the further question whether the Chiltern Hundreds, being an office under the Crown, vacated the seat of a member who was already a Minister of the Crown. It was notorious that Mr. Gladstone in 1873, being already First Lord of the Treasury, accepted the additional office of Chancellor of the Exchequer, and did not think it necessary to seek re-election at Greenwich. Mr. Gladstone explained that he had acted according to his interpretation of the Act of Parliament, and that it was the business of other people to challenge the course he took. It is too early as yet to pronounce any definite opinions on the new House of Commons. All that can be said is, that it is certainly hardworking. There has been much time wasted, unnecessary questions have been answered at unnecessary length, and some members have spoken much too often, and at much too great a length. The temper of the House was severely tried by the very unexpected length to which the Session was prolonged. But on the part of the recognized Opposition there was nothing like obstruction. The Irish, after the rejection of the Compensation for Disturbance Bill, occupied time that was growing very precious with a random debate on the strong, but not inappropriate, language in which Mr. Forster had characterized an inflammable speech of Mr. Dillon as wicked and cowardly. On the vote for the Irish Constabulary, the Irish made a grand display, resorted to obstruction of the old foolish, irritating kind, and kept the House sitting for twenty-one hours at a stretch. It was in vain that Mr. Bright tried conciliation and Lord Hartington firmness. The Irish longed for a faction fight and had it. Mr. Forster has shown them on the whole a firm front. He has declined to alter the composition of the new Irish Land Commission at their bidding, and although he used expressions capable of easy misinterpretation as to the probability of a new application for fresh powers being accompanied by a new Compensation Bill, yet he has strongly proclaimed the absolute necessity of upholding the law, and in proclaiming this he has been supported not only by English Liberals, but by all sections of the English Opposition. One of these sections has managed to make itself prominent by acting in limited independence of Sir Stafford Northcote, and compensating for the smallness of its numbers by its irrepressible activity and pertinacity. It may be said in defence of this little band that it is only acting in the same way, and may be rewarded in the same manner, as a group of advanced Liberals now high in office acted when Lord Hartington led the Opposition, and was rewarded when Lord Hartington and Mr. Gladstone came into office. Until his illness, Mr. Gladstone led the House with all his old untiring energy, and with all the domination of uncontested eminence. It was impossible that after his illness had taken a favourable turn and he was absent as a convalescent he should not be greatly missed, but Lord Hartington was at least equal to all that was expected. Sir William Harcourt and Mr. Bright have wantonly provoked considerable irritation, and Mr. Dodson has had the misfortune to be charged with the conduct of a Bill which had for a long time no contents, and with that of an absurd Bill for licensing the spread of small-pox on the payment of a small fine, which was fortunately abandoned. But, on the whole, it may be doubted whether the Ministry has, in spite of its flagrant mistakes, lost much ground.

ALTERIUS ORBIS PAPA.

We are not sure who it was that first designated the Archbishop of Canterbury *alterius orbis Papa*, but the phrase was quoted and emphasized in the late Bishop of Exeter's Letter to Archbishop Sumner on the Gorham Case. To many it would probably sound far fetched, if not wholly fanciful, and it is certainly difficult to see at first sight how the jurisdiction of a primate presiding over the dioceses of the southern province of England can be brought into rivalry with that of a potentate claiming, and throughout the wide extent of his own communion exercising, ecclesiastical supremacy over the universal Church. Nor can it be justly said that there was, up to a very recent period, anything in the actual more than in the theoretical position of the Archbishop of Canterbury to give any countenance to such a comparison. In practice no less than in principle his influence and authority was restricted within the limits of his own province, or at least of the Established Church of England. When an episcopate of the Anglican form was to be started in North America about a century ago, the English primate of the day declined to undertake the responsibility of consecrating the first bishop, which was therefore relegated with his approval to the unestablished "Primus" of Scotland. And it is only within living memory that any attempt has been made to provide a colonial episcopate for the vast dependencies of the British Empire throughout the world. Great however and rapid has been the change in these respects within the last half century, and even within the last twenty years, as is attested among other things by the assemblage of two successive "Pan-Anglican Synods" or Conferences at Lambeth. But no previous Archbishop of Canterbury, so far as we are aware, has ever put forward the claims of his See to a kind of rivalry of Ecumenical jurisdiction with the Papacy as Archbishop Tait has done in his recent Charge at Croydon. With the latter portion of the address, which deals with questions of the internal government of the Church of England, such as the Burials Bill and the Public Worship Act, we are not here concerned. Nor shall we meddle with the theological views which may seem to be indicated or implied in the Charge. But two-thirds of it are occupied with his Grace's estimate of the present position and responsibilities of "this chair," which has at least the merit of being an interesting, and will to many readers prove a novel one. It may not inaptly be regarded as a discourse on the text we have prefixed to this article, *alterius orbis Papa*, as will readily appear from a brief examination of the contents.

The Archbishop begins by observing that "the circumstances of this archdiocese are peculiar, and are becoming every year more so," inasmuch as every year Lambeth is becoming more and more a centre to which the whole Anglican Communion, and indeed "all the Churches which protest against Roman usurpation" look for sympathy and support. It follows of course that the work of the primacy, as distinguished from the diocesan work of the local See,

is constantly increasing, and hence the latter has had to be handed over—and must always henceforth, as we are told, be handed over—to a Suffragan—much as the Pope devolves on his Cardinal Vicar the diocesan duties of the Roman See. The Archbishop goes on to refer to the 162 bishops of the Anglican Communion scattered throughout the world, of whom 100 assembled two years ago, with "expressions of filial regard in our metropolitan Cathedral of Canterbury, the birthplace of Anglo-Saxon Christianity," and thence resorted for deliberation to Lambeth. We are next told of the frequent communications addressed to Canterbury from India, the colonies, and the United States, and not only so but from various outlying episcopal communities in the East—Syrian, Armenian, Chaldean, Nestorian, Coptic, Bulgarian, using "the old liturgies which are the basis of our Common Prayer," and from the Greek Church itself as well in Russia as in Greece and Turkey. All "these Oriental Christians show a lively interest in our co-operation, and have of late years expressed their desire to know more of us and to act with us in a fraternal spirit," and accordingly "those efforts, of which Lambeth is in a sort the centre," ought to be encouraged. Then there are the Jansenist Church of Utrecht, and the Swiss and German and Mexican Old Catholics also appealing to England for sympathy. And besides all these there are the German and French and Swiss Protestants, the Swedish Lutherans and the Moravians, whose boundaries of separation from Anglicanism "fade to an indistinct line." Clearly therefore "the time has gone by for us to rest in our insular position," and "it will be our own fault, if all the Protestant communities throughout the world, episcopal and non-episcopal, do not feel that their cause is indissolubly united with ours." And this being so, "you will grant that I am justified in a solemn address from this chair in regarding it as my duty to speak of things which concern the whole Church of Christ, and not to confine our view too much to the separate interests of our own diocese, or even to our own English branch of the Church." This is in short a kind of primatial or patriarchal allocution addressed *urbi et orbi*, not simply an episcopal charge to the diocese of Canterbury. Now we are not going to inquire here how far precisely the Archbishop is justified in what may to many read like a somewhat enthusiastic estimate of the growing influence of his see; that it is not altogether devoid of justification is clear if only from the facts to which he refers. Indeed at the time of the Lambeth Conference of 1878 the *Church Quarterly Review* distinctly laid down that the worldwide Anglican Communion "finds its natural patriarchate at Canterbury," and it was even seriously proposed in some quarters that the title of patriarch should be conferred on the Archbishop. Still less shall we enter upon any theological criticism of remarks which to some hearers or readers of the Charge may seem to make too light of the distinction between episcopal and non-episcopal Churches, or of the alleged errors of the Nestorian and other Eastern communities referred to. Our object is rather to call attention to the kind of position claimed for The Primate of all England and the very plausible line of argument by which it is supported. There can be no doubt that, whether with or without the title of patriarch, something of a quasi-patriarchal—not to say quasi-papal—attitude has of late years been almost thrust upon him by the growth of the colonial episcopate and the centripetal tendencies widely manifested in what is here called "the Anglican Communion scattered throughout the world." Archbishop Tait may have felt bound to do all in his power to foster and develope such tendencies, but the movement began, as he is careful to remind us, in an application of the American bishops to his predecessor, Archbishop Longley, which resulted in the meeting of the first Pananglican or Lambeth Conference in 1868. And it seems to have arisen spontaneously rather than from any deliberate design on either side. The Archbishop represents the unity of which he desires to see "Lambeth, in a sort, the centre" as a counter influence to the Roman unity, though he would be glad if "our Roman Catholic brethren" would allow themselves to be included in a wider bond of universal brotherhood. What can hardly fail to strike any reader of the Charge, who is at all familiar with Church history—though there is nothing to show that the analogy thus inevitably suggested occurred to the writer himself—is the curious and instructive parallel between his account of the incipient growth of the central influence of "this chair" of Canterbury, and the rise and growth, as historians have traced it out, of the supremacy of the Chair of Peter. We do not refer only or chiefly to such polemical works as the late Professor Hussey's *Rise of the Papal Power*, written for the express purpose of proving the purely human origin of the Roman claims, but to such learned and impartial works as Greenwood's *Cathedra Petri*, or even to the treatment of the matter, on its human side, by apologists like Hergenröther or Cardinal Newman.

It has been too much the fashion with Roman Catholic controversialists to exhibit the Papacy simply as a divine institution, which came forth at the first full-fledged and complete, like Pallas from the head of Zeus, while their Protestant assailants have represented it as a studied and gigantic corruption based on usurpation and forgeries. This is not the place to discuss the validity of "the Petrine claims," which had undoubtedly a good deal to do with the growth and gradual acknowledgment of Papal autocracy; the existence of a long series of spurious documents culminating in the Isidorian Decretals—which however in an uncritical age were very generally accepted in good faith as genuine—is unfortunately a matter beyond the range of discussion, as no candid writer of our own day on either side would dream of questioning. But after making full allowance for both these sources of influence, it remains true, apart from any theological controversy as to the rights or wrongs of the matter, that the historical growth of the Papal power was largely due to causes of much the same kind as those dwelt upon in Archbishop Tait's Charge. From the first "the circumstances of" the See of Rome "were altogether peculiar" and every year became more so, and its position at the centre of the world-wide Empire contributed both positively and negatively to its aggrandizement. On the one hand *e.g.* special rights of appeal to Rome were directly sanctioned by Emperors like Valentinian III.; on the other hand, as Mr. Bryce points out, the later fable of the Donation of Constantine had a groundwork of fact in the removal of the seat of Government from the Tiber to the Bosphorus, which made the Pope the greatest personage in the city. And that city was the capital of the civilized world. In the same way the Archbishop insists on "the great position to which the kindness of God has raised our nation," and how "even people in a remote region, who are known to have a clergyman of the English Church among them will feel nearly as secure as if they were under the protection of some regular emissary of the English State." And while considerations of this kind pointed to Rome as a natural centre, the ground for acquiescing in some central authority that might be recognized not only by "the Suburbicarian Churches," over which alone her jurisdiction originally extended, but by the various scattered communities of Latin, and even in a measure of Eastern Christendom, was again that it satisfied a need generally felt. Archbishop Tait speaks of the Bishops of the Anglican Communion in all quarters of the world looking "with filial regard" to Canterbury. At the beginning of the fifth century Innocent I. declared that the Churches, not only of Italy but of Gaul, Spain, and Africa owed filial obedience to the parent see, as they had all been founded by St. Peter or his successors. It was a considerable advance on this tolerably extensive claim when Leo I. half a century later said, "Roma per sedem Beati Petri *caput orbis effecta*," but Gregory I. did more in fact than either Innocent or Leo to advance the power of his see by his missionary energy and the fame of his personal sanctity. But the centripetal force was all along the same. The pretensions of Rome, whether secular or religious, to quote Mr. Bryce once more, "both sanctioned and satisfied the passion of the age for unity." It was from a similar conviction of the need of some kind of central power for holding together the manifold scattered divisions of "the whole Church of Christ" that Reformers like Melancthon, and men like Grotius and Leibnitz in the next century, who were anxious to bring about a reconciliation between the German Lutherans and the Papacy, professed themselves willing to concede to it some kind of primatial or patriarchal authority, as Melancthon put it, "ut doctrinæ consensus retineretur in multis nationibus," or because, to use the words of Grotius, "in every college and society of men there is need of a director." That there is some force in this common-sense view of the matter no reasonable man will deny, but it is equally clear that, where no strong counteracting influences are brought into play, it may easily be pressed in ecclesiastical as in civil matters to the extremest and most despotic consequences. It used to be a favourite argument at the time with the more moderate apologists of the Vatican decrees that papal infallibility must be accepted at all costs, when once sanctioned by Rome, whether it could be proved to be primitive or not, because it was certainly wrong to break with the centre of unity. We are of course very far from suspecting Archbishop Tait of making any such demand of allegiance as that for his See, and he indeed insists that unity must be balanced by diversity. But a study of some work like the *Cathedra Petri* will show how the Papal power, as it now exists, did in fact grow up from comparatively small beginnings through an increasing sense of the need of some central authority, while on the other hand the checks imposed on its development, whether by the civil Government, or by patriarchal, metropolitan, and other competing jurisdictions previously recognized in the Church, were on various pretexts one by one suppressed or withdrawn. It is interesting to trace a certain analogy in the sketch drawn by the Archbishop to the earlier stages of the process, though it would be somewhat Quixotic to apprehend under conditions so materially different the possible establishment of such another Papacy at Lambeth.

A GOVERNMENT OF MANY COOKS.

THE friends of the Government are getting up a testimonial to Mr. Adam; we do not know that its enemies and the public generally could do better than to get up a testimonial to Sir William Harcourt. The Home Secretary has in the course of the Session been repeatedly instrumental in illustrating the peculiarities, not to say the weaknesses, of the Ministry which he so conspicuously adorns. Nothing could, in a small way, be more characteristic of the Gladstone Government of 1880 than the almost forgotten cattle incident at the Oxford election. By way of inculcating Sir William Harcourt's claims upon the citizens of Oxford, these independent and enlightened citizens were treated to the sight of a large procession of foreign oxen, the meaning of which was that the late Government had been cruelly curtailing the English meat supply, and that their successors would throw it open and cheapen it. Sir William is not yet a veteran in the

Home Office, and he has lived to see the cattle orders put forth by his predecessors eulogized by his own colleagues and maintained in the face of Radical attack. It is true that the opinion of the citizens of Oxford has ceased to be a matter of pressing concern to the Home Secretary. He has migrated—politically speaking—from the Isis to the Derwent, and it is very satisfactory to think that his new seat cost him considerably less than his old. The migration sent him back to Parliament perhaps a sadder, but apparently a not much wiser, man. The guardianship of hares and rabbits, or rather the task of multiplying the foes of these unhappy beasts, has had a bad effect on Sir William's natural lightness of heart. He has joked but rarely of late, and his jokes have been of a grim and savage character when they have appeared. But on Saturday last he retrieved his reputation by perpetrating a joke of a very superior kind. It was probably not done on purpose, unless we are to suppose that the dull defensive war of office weighs on Sir William's spirits. But it was not the worse for this; indeed, it may be said to have been sensibly the better.

Saturday afternoon and evening were, it is hardly necessary to say, devoted to the Burials Bill. The crisis of Mr. Osborne Morgan's life had arrived. There is a well-known story of a mysterious traveller who said to Dr. Johnson, in an inn-parlour, "Sir, do you know who I am? I am the great Twalmley, who invented the new floodgate iron." If any one can imagine the state of mind of the great Twalmley on being charged by an all-powerful Ministry with the conduct of a Bill making the use of the new floodgate iron compulsory upon all washerwomen, then he can also imagine the state of mind of Mr. Osborne Morgan on Saturday. He had not only invented the Burials Bill, but he [illegible] had nursed it through its troublesome youth, and fed it into something like a body and a presence. Before Mr. Osborne Mor[illegible]an nobody had a grievance on the subject, and there are impenitent Nonconformists—*vide* the reports of their triumphal breakfast some months ago—who stoutly deny that they have any now. But Mr. Osborne Morgan "promoted" his grievance with a skill worthy of the most accomplished financier. He got it quoted on the political Stock Exchange, he made the chief men of his party take shares; in fact, he showed talent which, in the strictest and most literal sense of the famous phrase, was worthy of a better cause. His felicity of Saturday was of that kind which is hardly permissible to human beings, and which Nemesis is but too apt to temper with some unlooked-for ill. The unlooked-for ill came in the person of the Home Secretary. It was not to be expected that Sir William Harcourt should take a persistent or studious interest in the Burials Bill. To Sir William, as to most of his colleagues, the Bill has been, of course, merely a means to an end, and the attainment of the end has fortunately relieved them of any elaborate anxiety about the fortunes of the means. But it so happened that at the moment of Sir William's serene entrance into the House on Saturday an amendment was being discussed, which had some distant reference to points of historical and constitutional law. On such points Sir William Harcourt is supposed to be something of an authority, and he boldly struck into the discussion at once. This would never do; it was an outrage upon the constitution and the principles of historical Liberalism, and Sir William proceeded to demonstrate in the most convincing fashion that he and the Home Office would never away with it. Now unluckily, not only had the particular amendment, though urged by a private member in the first place, and therefore fair game for Sir William, been accepted by the presiding genius of the hour, the Judge-Advocate-General, but this acceptance had been ratified by the presence and acquiescence of Lord Hartington himself. The tableau must be admitted to have been a striking one, and the light cast upon the unanimity of Ministers, and the careful manner in which their concert is secured, to have been rather lurid. What made the imbroglio more delightful was the fact that burials and such like matters really come in a way within the Home Secretary's province, and that Sir William therefore spoke apparently with added weight. Had such a thing happened in an Irish debate thirty-six hours of motions to report progress would have been the inevitable consequence. It may surprise those who have discovered that Tory obstruction is to Irish as sunlight to moonlight to learn that no such result followed. Lord Hartington had to get up and remark, of course politely and Parliamentarily, that the Home Secretary had been speaking for himself, and that honourable gentlemen must not mind him. Sir William confirmed this statement in the most genial manner, and the incident by favour of the Opposition ended peaceably and with a great laugh against the Government. But it is terrible to picture the feelings of Mr. Osborne Morgan, and they can be dimly adumbrated only by recurrence to our former parallel, and by the supposition that at the last moment a superior of the great Twalmley had got up and denounced floodgates as an unconstitutional and radically illiberal adjunct to flat-irons. As it is, Mr. Morgan is nearly as much to be pitied as he is to be envied; his greatness has ripened, it is true, but fruits after ripening drop. It is not given to man to discover two such profitable inventions as the Burials Bill, and really if Mr. Osborne Morgan were only a Nonconformist, which we believe he is not, it would seem to be the best thing for him to get himself buried under his own Bill. He has lived and has carried, or as good as carried, a measure relieving a grievance which nobody felt at the expense of inflicting one under which thousands of persons will smart for years. He has enjoyed the happiness of this world, and even Sir William Harcourt, whose powers as a kill-joy are considerable, has not been able to dash the cup from his lips. The song of Thekla is clearly the most appropriate ditty for the lips of the member for Denbigh.

The Home Secretary's escapade, however, ought not to be regarded in this merely personal and isolated fashion. It is an admirable illustration of the chances which await a Government of too many cooks. One of the first public performances of any member of the present Ministry was the assumption by the Postmaster-General of the functions of the Secretary for India. Mr. Fawcett ate his words; Lord Hartington did his best to follow Barnes Newcome's advice, and sweep up the broken glasses; and the matter ended. Almost the last incident of the Session has been a similar and still more dramatic piece of meddling, in which Lord Hartington has again had to perform the same function. The truth seems to be that the excess of talent in the present Government is so great that little accidents of the kind are unavoidable. Everybody knows everything about every department of State, and everybody is generously eager to display his knowledge. This general omniscience evidently renders the prosaic expedient called a Cabinet Council something of a work of supererogation. There is no need to secure the Ministerial concert, because all the members are ready to take their parts, or anybody's part, at a moment's notice and play them faultlessly. Such incidents as that of Saturday, not to mention a good many others earlier in the Session, would seem, however, to show in the Ministerial concert the same trifling defect that Lord Salisbury discovers in the European. They both have a habit of being out of tune. In the case we are at present discussing it would indeed be very singular if the concert were not out of tune. Ministers are very fond of proclaiming the wonderful harmony which exists between them and between the different sections of their party. The evidences of this harmony contained in the votes on the Bradlaugh business, on the Irish Disturbance Bill, and in this matter of the disposal of the remains of Mr. Osborne Morgan's interesting clients would make a good subject for a prize essay of the Burnett and Bridgwater kind. If these things are done in a first Session, a more excellent harmony still may reasonably be expected at second, third, and future appearances. For the present there is what is called in melodramas a Bond of Blood between the members of the Government party. They have just slain a Tory Ministry, and can hardly be supposed to be yet weary of dancing over the bodies. Moreover, the many cooks are still occupied in the preparation of their particular messes. Mr. Osborne Morgan is the happiest man of this Session; Mr. Dodson, with his Anti-Vaccination Bill shelved, is probably the unhappiest. But the cooks and their messes seem too apt to get a little mixed. Sir William Harcourt's jugged hare jostles Mr. Osborne Morgan's cold Dissenter, and Mr. Forster's Irish stew has pushed several messes of Scotch broth, as well as the just mentioned soothing syrup for infants and their mothers, off the fire altogether. After a few more of these processes the harmony of the cooks, already rather disputable, may be expected to disappear altogether. We have been pretty plainly given to understand that the simple and elementary dishes of the present year are to be succeeded next year by something much more ambitious, and this will give the independent spirits of the Liberal Ministry and the Liberal party more room to display their independence. The Home Secretary in particular may be safely relied upon for many more pleasing displays of private judgment. If it were not audacious to tender advice to a Ministry which unites all the talents with all the virtues, we should suggest that the best way to secure unanimity would be to arrange for one Minister only to attend the House and take charge of all Bills during each day or week. The known ability of the members of the Ministry is such that none of them could object to the responsibility, and the spectacle of one member of the Government getting up and flatly contradicting another would be spared. Besides, as it is rather a habit of the present Ministry unexpectedly to lose their seats, considerable difficulties would be avoided in this respect also. There might indeed be some pleasing variations between the conduct of measures in successive hands, but that could not be helped. Besides, it would be difficult to exceed the latitude which the Government have already allowed themselves on this head. Under such a system it would probably be necessary to chain Sir William Harcourt to the Home Office desk during the days when he was not on duty in the House. But he has already been accustomed to considerable absences from St. Stephen's, and thus the enforced abstinence from debate, though doubtless trying, would not be altogether novel to him. Lord Hartington, when he has succeeded in getting the Indian authorities to let him have some intelligible information about the orders which exposed a British army to a disgraceful defeat, might perhaps give his mind to the task of muzzling his former mentor.

IDEAL ARMIES.

To no subject in one or other of its many aspects is the attention of Parliament, the press, and the intelligent part of the nation given more frequently than to the method by which the thorough efficiency of our national forces, naval and military, may be secured. The quick succession of little wars in which we become engaged serves in great measure, no doubt, to keep up the general interest. And in such sense they are a godsend to the nation. Without them we should, after our fashion, go to sleep;

and we cannot afford so to do. Every notable European Power is striving to obtain the most perfect possible army; striving to economise in other ways so as to devote more money to the arming and training of no longer tens of thousands or hundreds of thousands, but millions. Each Power also is striving to possess a navy which in one or more particulars shall distance all competitors. Every new weapon and missile and deadly invention is greedily caught up and examined by experts deputed from each country to watch what is going on in all the others. It is no exaggeration to say that over the whole of Europe the best energy and intelligence of all peoples have been for years past, are now, and will be henceforth, exercised in devising the most certain means of acquiring superiority on the battle-field. No professions of goodwill by monarchs, no assurances of rival statesmen that the preservation of peace is their first object, no dream of a coming era of universal brotherhood, no belief in the civilizing agencies of commercial treaties, must blind us to the likelihood that in some near time a tremendous conflagration may be the result of the vast heaping up of combustible matter now proceeding everywhere.

It must seem strange to many people that with all the attention we give to our army, and the enormous sums we spend upon it, we never seem perceptibly nearer attaining such perfection as to place it beyond the reach of disparagement at home and something like ridicule abroad. It is some satisfaction, however, to learn that in every country the national army is a subject for dissection and criticism at the hands of theorists, civilian and military; and if our own imperfections are constantly being exposed with more or less reason, and remedies suggested of more or less efficacy, so is this the case also in France, Italy, Austria, Russia, and in Germany itself. Each nation, as we said, desires to possess an ideal army; and in proportion to the excellence of the ideal is naturally the difficulty of realizing it. That in England we are some way off attaining excellence all round may be taken for granted. We can confirm this negative aspect of things any day by a visit to Aldershot or the Curragh, when attending a Queen's review at Windsor, or even when watching the morning parade of any cavalry or infantry regiment. Latitude being apparently permitted now to military men in a degree which would have wonderfully exercised the Duke of Wellington to hold forth in public upon everything—we had almost said everybody—connected with military matters, it is not difficult to arrive at the professional opinions held by both staff and regimental officers. When we hear, then, from those who are at once experts and interested in the credit of our army, judgments condemnatory of various points in our military system, it is not open to the general public to attribute all such judgments to a desire of finding fault, or to set down the fault-finders as croakers and theorists. On the other hand, the very interest many officers of ability and scientific civilians take in the army impels them a little too fast sometimes in the path of inquiry and reform. Any one who peruses the valuable and too little read "Journal of the R. U. S. Institution" will perceive how the authorities are beset by inventors, some of whose inventions reflect credit on their authors, while others are remarkable as much for their eccentricity as for their ingenuity; but the inventors, as a rule, seem to have this in common—an absolute faith in their own specifics, and a belief in the existence of a conspiracy to reject these without adequate testing. It is always difficult to make men with a hobby comprehend that those who are responsible for all novelties introduced into the complex machine of an army have to look at the general, and not only the particular, results of a change.

Each country has difficulties common to many others, and each has difficulties peculiar to itself, in the endeavour to compass the most perfect military system. All are working on different conditions, with very diverse material, for an identical result—the achievement of a machine elaborated with all the newest inventions. A common danger, of which perhaps we have in the case of France at this moment an illustration, is lost, on the one hand, we think too much of mere machinery and mechanical accuracy; and, again, lest we become oblivious of wholesome traditions and adopt half-digested theories. To take a minor instance of the first danger, many military men propose to lay down hard and fast rules as regards the proper formation of infantry for attack, forgetting apparently how infinitely ground varies and situations vary; while others legislate absolutely for formations of defence, and even for preservation of certain distances. Now, no wood, and no hill, and no stream, and no plain is exactly like another, and the peculiarities of each demand at least some recognition. Though we have got rid of much of that rigidity of movement which we had borrowed from Prussia, there is a tendency to frame in its place a theory of formation, of drill, and of manœuvre, which shall be applicable under all circumstances. That is to say, we picture to ourselves what battles are like or ought to be like, and then we drill up to their fancied requirements; but, as Sir Garnet Wolseley says, "We ought to do exactly the reverse; we should find out what an action really is like, and then modify and adapt our drill to provide for these tactical realities." And as, according to the same authority, the culminating point of any action is utter confusion, "it behoves us in our drill to accept that confusion, to prepare for it, to recognise that it is an essential part of every general action, to drill up to it, and frame our regulations with a view to meeting it, and not to ignore it and say it is a thing you ought to avoid."

The inference to be drawn from the striking examples recorded in history, where a poorly conditioned and imperfectly trained force has worsted one of pattern organization, discipline, and drill, is not that there is no great virtue in method and precision, but that these are apt to become engrossing subjects of attention, to the exclusion of considerations which should always be present—the cultivation of *morale*, and the opening out a field for talent, judgment, and enterprise. It is the glory of the later German school to have so far, in direct opposition to their former habit of war, and even, we may say, their natural genius and disposition, successfully associated adequate precision of detail with wise latitude of action. To our theorists of opposing schools—to those who in each fresh development of the tactical art discover a stronger necessity for increased discipline, stricter drill, greater centralization; who see in telegraphs, signalling, ballooning, so many instruments by which a commander centrally situated may more readily communicate with his divisions grouped about him; and, on the other hand, to those who are all for dispersion, who would substitute loose drill *plus* intelligence for exact distances, accurate point-dressing; who look upon telegraphs and signalling as so many means of uniting units of command rather than as giving a central chief a better hold upon his divisions, who are in a word for extreme decentralization, and whose war motto is "order in disorder"—a taking phrase the soundness of which has not yet been submitted to the logic of reverses—we would submit this question:—"Is not each successive stage of the art a compromise, where the best traditions of the past assimilate the developments of the present, rather than a revolution which would establish the art upon a novel basis?" While the first school dreams of an army grouped as of old about its chief, but receiving from him more rapid inspiration than formerly, the second forgets what force there is in the tradition of an army, what merit in its best traditions, and how impossible it is to break away from such without impairing seriously its most cherished and potent characteristics. An army has a continuous history, with its economical, tactical, martial traditions; these are its very life; the story is not passed by one set of men to their descendants to be obscured and mutilated in the passage; but every man joining a regiment is, as it were, woven into the texture of his corps, and becomes part of a system, and the representative of a tradition. The development of tactics affords fresh scope, and gives wider employ for the exhibition of national characteristics, and does not act detrimentally upon them. Rather we may say that the army of every country gains in that its highest qualities find wider area for their expression. To illustrate our meaning; it is often said that the French lose much by the introduction of arms of precision, their chief battle characteristic being impetuosity, and their successes having been largely due to the brilliant dash of their column attack, now become impossible of execution. But if they lose in one way they gain, we think, more in another; they are naturally the most intelligent soldiery in Europe, and their quick-wittedness, when intelligently directed, will find a wider field for its employ, through the expansion of its power in a more open order of combat, than in the old concentrations where individuality was lost. Moreover, the success of both cavalry and infantry onsets will now more than ever be due to brilliant dashes executed with new precautions and in other formations. Possibly there were many found in Prussia to foretell all manner of disasters when the breechloader was introduced into their army, and to predict at a later date that the Prussian tactical system would not survive any modification of rigid lines and deep columns. Yet how admirably does that leaning in the national character towards strict discipline, method, formality, tend to correct those exaggerations which might otherwise grow out of the power given to inferior commanders of initiating action. So that the Prussians have no fear of that coming about which at present perhaps too much exercises the French—namely, the fear of their troops getting out of hand when in scattered formation.

And have the British no tradition in their military story which should make them chary of obeying the battle-ways of the last Power which happens to be victorious in the field? What is it but a link in the chain reaching from Crécy and Agincourt which causes it that our troops are armed with the best rifle (taking it all round) in the world, and are also the steadiest shots and most skilful marksmen? It is well worthy the reflection of such as taunt us with being an unmilitary people that the instinct which taught us to look to the bow as the arm with which we should achieve most, and the capacity that enabled us to use it more effectually than others did, has survived every change; the teachings of tradition were visible, as at Ramillies and Malplaquet, so in all our Peninsular battles; as at Inkermann, so now also. It is curious and instructive how our entire people seemed to grasp, as if by instinct, that the perfecting of small-arms would benefit themselves more than others. The very first idea in the minds of all practical military men is, whatever our system of tactics may be, we *must* make of our soldiers good, steady marksmen. That which in no mean measure has tended to popularize the Volunteer movement, and keep the men together, is the widespread system of rifle competition and the universal desire to be a good shot. The truth that in the long run the battle would be to the best holders of the best rifle was appreciated in England years ago. When, in 1860, the present writer went to Châlons, he was at once struck by the manifest inferiority in the shooting of French soldiers to that constantly seen at home. He was still more struck with the inadequate apprehension by the officers of the pre-eminent part good, steady shooting is bound to play on the battle-ground. While our rifles were sighted and used with effect up to 900 yards, the French were only sighted to

500 yards. Over that distance the thumb was roughly used as a back-sight, it being considered useless to endeavour to obtain accuracy in the confusion and smoke of battle. In twenty years rifles have improved, and more than ever do we recognize the utility of turning out in every corps the greatest possible number of good shots; and we strive to impress on each soldier of what importance is his individual weapon and prowess, and how essential it is all fire should be given with deliberation. It is suggestive of conscious power that while French and Turks begin to blaze away in harum-scarum fashion at the extreme of rifle reach, on the bare chance of some shots telling and with a view to encourage themselves, our idea with the Martini, as with the older weapons, has been to reserve fire for distances within which our men can rely on proven skill, and to abjure wild, aimless shooting, with its attendant waste of ammunition and its unwholesome manufacture of excitement. "The first object of a captain," says Captain Freemantle, in the naval Prize Essay for this year, "should be to bring his men to close quarters with the enemy while still cool and under command. It is certain there will be less excitement and more careful firing subsequently."

It follows, since we lay such store by good shooting, that we should give without. revolutionizing them, such expansion and such elasticity to our tactical formations as will enable us to get the full value out of our arm. No need exists to upset the organization of our infantry regiments. As steady shooting during a combat can only be secured by the most unremitting *surveillance* of the company officers, we have at once a solid argument in favour of small companies. The French adopted the Prussian system of large companies, and then found these were not manageable, even in peace manœuvres, unless the captains were mounted. But nothing is more certain than that the idea of a mounted captain controlling a line of skirmishers in action is a myth. In the first place, he is compelled to dismount—in the battles of their two great wars the Prussian infantry captains dismounted—and then how is he situated for directing his 250 men? Our authorities deserve all credit for not having surrendered, as the French did in a panic, the old system of small handy companies, well officered. With the majors of half-battalions lies, or should lie, the power of initiative possessed by Prussian infantry captains; while the fire-control of each company is the matter which lies more immediately within the compass of the captain's discretion, and is the point to which he should always, with due regard to securing all available cover, direct his attention.

But did we not *always* aim at giving our men's individuality full play? Another old British tradition, beyond that of making good marksmanship a paramount consideration, was the adoption of formations admitting of the widest fire development, such as lines three and two deep, and hollow squares. Napoleon was a long time in finding out the loss of fire power occasioned by the French practice of forming lines four deep. It was not, if we remember right, till 1813 that he issued that remarkable order—"The Emperor directs that henceforth line shall be formed three deep, His Majesty having observed that the fire of the fourth rank produces no effect." Truly a startling discovery to be made so very late in the day! It is strange indeed that we should be taunted with dulness of tactical apprehension when down to the other day we have always proved our marked tactical superiority; and stranger still, that so many in our midst should have read history to such little purpose as to ignore the very causes which, more than any leadership, brought about triumphant results on so many fields. It is, then, the tradition, and it is the instinct, of British troops to seek tactical excellence and superiority in the use of weapons. These are our strong points. And here we rejoin our argument.

In our pursuit of the ideal we start, as we have seen, with strong points in our favour. It behoves us to see that we are true to our past, while we consider how to redress the balance where our neighbours have advantage of ourselves. Each people having its strong and its weak points, in what do we compare unfavourably with others? The answer is not far to seek. "The British soldier," wrote Sir William Napier, "is the soldier of battle." He did not say, and could not have said with justice, "he is the soldier for a campaign *par excellence*." A Frenchman, a Spaniard, is a far better campaigner; he can shift for himself, is contented with less, is not so helpless without his superiors, not so utterly dependent on his beef and rum, is more cheerful and tractable under privation. This applies with equal force to all arms. There is a saying, we fancy little known, of the Duke of Wellington which was told us by a late member of the House of Commons who was present at the dinner-table of the Prince Regent (George IV.), when the latter put it to the Duke that in campaigning the British cavalry are the best in the world. "The French are very good, Sir," replied the Duke. "But the English are better," pursued the Prince. "The French are very good, Sir," the Duke quietly persisted. Again, there is invariably observed about a British army an unreadiness to enter upon a campaign. It is discreditable that a Power having so many interests to defend should be perpetually surprised into a state of unreadiness for even a little war, and should have to fling about millions broadcast before an army duly constituted can be set in motion. Like the Austria of the times before 1866, we have aimed too much at perfecting individual military instruments, and thought too little of combining them for harmonious action. Again, how important it is now-a-days when mind against mind is called into greater exercise in various degrees from the general to the private soldier, that all should take pains to learn and be eager to receive instruction. "Our profession," says Admiral Jurien de la Gravière (he is speaking of the navy, but the remark applies with considerable force also to the army), "was formerly an instinct; it is now a science." Yet any one who knows anything of British officers must have noted their indisposition to interest themselves in any subject of professional scientific inquiry. They have an intelligent hold of two or three main ideas, and trust to their mother-wit and common sense (of both of which it must be conceded they have much) to supply all deficiencies as occasion shall arise. Since such is notoriously the case, how difficult does it become to spread instruction among the rank and file! One particular result is that any practised eye watching a battalion at outpost work or light infantry manœuvres on ground inviting judicious utilization will draw the conclusion, three times out of four, that what is specially aimed at on all sides is the carrying out of barrack-square drill with its set distances, &c., according to regulation, and not the turning to profit of opportunities afforded by accidents of *terrain*. Do our generals set an example to their staff, and field officers to their regiments, of studying, we shall not say the sometimes ponderous technicalities of Jomini or the Archduke Charles, but such admirable practical works as those of Hamley and MacDougall? How many of our cavalry and infantry officers, excepting some of those who have passed the Staff College, are competent to execute a rapid and sufficiently accurate reconnaissance of a tract of broken country, to trace the most suitable field-work for the situation and the occasion, fortify a village, select the most appropriate kind of bridge to throw over a stream and direct its construction, report upon the suitability of a position for defence, and the like? On the other hand, we should be somewhat surprised if the first German officer we came across was not quite competent to do any of these things. We need not stay to argue the necessity of giving our officers the best theoretical and widest practical instruction when we see how universal is opinion abroad in favour of spreading professional knowledge among all ranks. Italians are fully as earnest as are Germans in making scientific preparation against the next war. In France, before 1870, all ranks spent their day in *cafés* and their intelligence over dominoes, billiards, and absinthe. In the mornings, at least, the *cafés* are now almost tenantless, for officers and men are kept hard at work. We may be very sure that, in the next struggle, instructed intelligence will come well to the front.

An ideal army—one of which the component parts shall be all equally perfect by reason of possessing the highest physical, moral, and intellectual qualities, and the best possible organization—it can of course be the expectation of no Power ever to possess. In fact, to obtain a perfect force, in one sense, it would be necessary to form an international army, with solidity borrowed from one source, science from another, high *morale* from another, &c., and the conglomeration would lead to most imperfect results on the whole. What is within the competence of every Power is to adapt its special genius to the turning to account of successive developments in the art; and, while neglecting no means of strengthening weak points, to obey its own instinct of war, and hold fast its traditions of battle with such gradual modifications in organization and tactics as experience shows to be advisable. As regards ourselves, whatever we do, let us be in no haste to imitate the French, who, after swallowing entire the German system, are evidently at a loss how to digest it, and who, in Prussianizing their army, run no small risk of losing those characteristics which have hitherto rendered them so formidable on the battlefield. That instinct of war and that art in war which at Waterloo disposed our array in such manner as to secure the greatest amount of concealment and protection, with the widest sweep of fire, and the power of assuming a swift offensive, have able exponents now also, if these are less illustrious than Wellington; and, arguing from a continuous exhibition of tactical superiority in the past, we may be persuaded that the tactics we adopt with conviction to-day will be found in sufficient correspondence with the necessities of to-day.

DRAWING.

IT may seem presumptuous in these days, when South Kensington has extended its paternal despotism over the length and breadth of the land, to assert that drawing is, as a rule, very badly taught in England. But we do assert this most distinctly, and we are encouraged in this temerity by the example of M. Viollet-le-Duc, who, shortly before his death, wrote an elaborate work with the express purpose of establishing a similar proposition with regard to France. This work, the *Histoire d'un dessinateur*, is cast in that abominable narrative form which has fortunately ceased to flourish in England, besides being burdened by the introduction of a French version of Mr. Barlow, with an incredibly good little boy, who is almost more insufferable than Harry Sandford; but to any one who has the patience to disentangle the important ideas so elaborately wrapped up in the entirely uninteresting personal history of Monsieur Majorin and petit Jean, the work cannot fail to be instructive.

We all know how drawing is generally taught. The lowest depth is to be found in the system of the fashionable drawing-master. In this the greatest stress is laid on the management of the pencil. Trees are to be represented by a particular touch, rocks by another, water by another; shadows are rendered by parallel lines; lights can be advantageously

put on with white chalk, &c. In a word, everything turns on manipulation. Until very recently the system pursued in the great schools of art was little better. There was an elaborate method of stippling by which the shadows were worked up to an exquisite velvety texture, whilst correct outline or modelling were regarded as quite secondary matters. There used to be harrowing stories told of pet pupils at South Kensington who spent six months on the shading of a single figure, and entrance to the schools of the Royal Academy is still barred to those whose accuracy of drawing is not equalled by the smoothness of their execution. At South Kensington there has been a great change for the better since Mr. Poynter has been placed in authority, but routine is still powerful, and art is still taught as if it had no relation to the life around us. And this brings us to the question, what is drawing? Drawing is the art of seeing correctly. There is no difficulty in putting down what one sees, provided one sees it clearly and rightly. Execution is a mere affair of practice, a dexterity which any hand will attain with time and use. The great masters have used the most varied means of recording their impressions of nature. No two ever draw alike as regards mere execution; but all succeed in conveying to others a correct impression of the image that was before their eyes. In the *Histoire d'un dessinateur* the artistic capacities of petit Jean are first discovered by a rude drawing that he has made of a cat, in which the animal is represented as seen from the front with only two legs and a tail sticking out of the top of his head. When it is pointed out to him that this cannot be like a cat, because a cat has four legs and a tail that does not grow out of the top of his head, he only replies that he saw it so. Whereupon Mr. Barlow—we mean Monsieur Majorin—embraces him tenderly, and adopts him on the spot. And, indeed, petit Jean was quite right; he had drawn what he saw, and nothing else, and that is the task that all draughtsmen have set before them. This is the capital problem not only of draughtsmanship, but of many other things. To state what one has observed without telling lies about it is the most difficult thing in the world, but on this depends all progress in the whole domain of science.

When petit Jean has been adopted by M. Majorin, he is encouraged to draw anything and everything that he sees around him. These drawings are duly corrected, and, when it is practicable, they are made an excuse for instructive explanations which would seem to belong rather to general education, but which are useful also to drawing by impressing the objects drawn more firmly on the mind. And here we come to the important truth that drawing, although it must always chiefly depend on the direct observation of nature, can nevertheless be greatly indebted to various indirect aids. A little elementary geometry is of great service, as giving certain typical forms by which the forms of nature can be classified and remembered. The mutual relations of these forms are given by geometry in their simplest aspects, and disentangled from the complications which are met with in real life. When familiarized with these abstract types, the pupil may proceed to perspective, the study of which is hopeless until he has a clear understanding of what is meant by a straight line, a plane, an angle, &c., knowledge which oddly enough does not come by nature or even by definitions, but, like most other knowledge, by familiarity. The study of perspective is a very important aid to drawing—so important that the conventional teaching has been compelled to recognize it—but with characteristic perversity has always begun with it at the wrong end. As in the study of grammar, a number of rules are given before the pupil has the least conception of the subject matter to which they are applicable—in neither case are the results very encouraging. And yet the proper way of teaching perspective is very simple. Very soon in the course of his drawing the beginner stumbles across certain difficulties, owing to the discrepancy between what he really sees and what he thinks he ought to see. For instance, he is drawing a cart. Knowing that the two wheels of a cart are of equal size, he draws the further wheel as large as the near one, and then his drawing looks wrong. His teacher takes the opportunity of explaining that things decrease in apparent size as they are further away from the spectator, and that apparent size is all that he has to trouble himself about. When the pupil has got this clearly into his head he has mastered the fundamental principle of perspective. The teacher now informs him that there are certain rules founded on this principle which will enable him to draw simple figures with great facility and correctness. Having learnt these rules, the pupil is taught to connect them with practice by some such simple device as tracing a building, a piece of furniture, or any real object of sufficient simplicity, on a pane of glass, and then seeing that the rules of perspective are merely an account of how such objects look. It is this conception that is so essential to a vital knowledge of perspective, and which the ordinary teaching so entirely neglects—namely, that everything in nature is seen in perspective, and that for the simplest cases there are definite rules which can be applied in aid of observation. For complex cases, such as the forms of clouds, or trees, or mountains, or the human face, no definite rules can be given beyond the fundamental one that the apparent size of an object decreases as the square of its distance; so that perspective can never be more than a slight help to that direct observation which is the foundation of all drawing.

Drawing is aided in a somewhat similar way by an elementary knowledge of various sciences, such as anatomy, morphological botany, and geology. These enable the draughtsman to avoid errors and direct observation to the important points of the object to be portrayed. Again, they increase the interest with which he looks at forms, and are an immense help in enabling him to remember them; but they have their dangers, in tempting him to substitute what he thinks he ought to see for what is really visible. For instance, superficial knowledge of this kind might have made petit Jean draw his cat with four legs when he only saw two; and in no case should the importance of these studies to the draughtsman be exaggerated. They can enlarge his mind and they can aid his observation, but they can never stand in the place of it. It is certain that the Greek artists of the best period were unacquainted with anatomy, but their knowledge of the human form has never been equalled. It will be objected when we have got so far that our draughtsman is always supposed to be drawing something that he sees before him; is he never to draw out of his own head? Certainly he should be trained to draw from memory, especially if he afterwards compares his drawing with the original to keep up his standard of correctness. But is he never to imagine anything? As much as he likes; but that is no part of his education. No one can teach imagination. If he has it, all the better—if he has not, he may still be an excellent draughtsman. He may be taught to combine the elements of things he has seen so as to make new things that he has not seen, and for this any scientific training will be of great use; but the creative touch that will put something new into the combination, something that did not exist in any of the elements, is a matter of genius, and as such unteachable. We must teach our draughtsmen to see things as they are, and to so portray them as to give a correct idea of their appearance to other people—with that the duty of the teacher ends.

It will here be objected that all this will never make an artist; that, in all genuine artistic work, there is an element of taste, of refinement that such training will not give. Granted; but then our draughtsman need not become an artist. This is precisely the question that is faced by M. Viollet-le-Duc. After petit Jean has learnt to draw, M. Majorin makes various experiments to see if nature has destined his pupil to be a painter or a sculptor. Having decided in the negative, he is not a bit discouraged, being of opinion that knowing how to draw cannot fail to be useful to a man in any position of life. And indeed, if our definition is correct, it is obvious that a draughtsman must have had his faculties of observation sharpened far beyond those of his fellows. Petit Jean gets apprenticed to a cabinet-maker; and of course makes his own fortune and that of his family, with that fine regard for consistency in which books are so much superior to real life. But we may readily grant the extreme value of good draughtsmanship in all pursuits where knowledge of form is at all essential. Indeed, in no other way is that familiarity with form obtained which is essential to dealing with it successfully. But, supposing petit Jean had had the artistic sense, would his training have been of benefit to him as an artist? Undoubtedly. It has never yet been held, even by the most refined of art critics, that a painter can draw too well. But will not this extreme accuracy have deadened his artistic sense? Will he not sink into vulgar realism? That depends on petit Jean himself; if he has imagination it will come out in his pictures, and all the more freely in that he has fewer technical difficulties to contend with. Indeed there is nothing sadder than to see high imaginative gifts cramped and spoilt by the insufficient means of expression at the command of the artist. But supposing he has no imagination? Then he had better be content with realism; if he has the true artistic taste, we may be sure it will not be vulgar; realism, after all, means nothing worse than truth to nature. There is an art which teaches and inspires and an art which records.

Of artists who are qualified to teach the world there are but few. Of those who can do good service in recording the beauties of nature there are fortunately many, and there would be more were not so many eager to teach who have nothing to say, and to inspire who have no inspiration. If we wish to be freed from the false sentiment, sickly pathos, and forced tragedy of modern art, let us not be too hard on realism.

THE HARVEST.

WITHIN living memory probably there has not been anxiety more intense as to the results of the harvest of the country than that which during this season has filled the minds of men who have to do with land. Farmers' grievances have passed into a byword, and even now are not believed in by the public at large. There can, however, be no question about the wolf having come at last. The successive failures in various crops, and the epidemics which have worked such sad havoc among herds and flocks during the last few years, have ruined, as is well known, an immense number of farmers. How many more there are whose resources are all but exhausted is not known. Many have given up their farms as insolvents; others have given them up in the hope of saving some small fraction of their capital out of the wreck; many more hold on in the desperate hope that a succession of good seasons may be before them, when they may be recouped the losses that have brought them to the brink of ruin. It is not to be wondered at that those who had capital sunk in the cultivation of their farms should hold on to the last, in the hope, however desperate, of seeing their money back. And landowners generally have made concessions, varying in degree and in kind, to their tenants, in order to induce them to struggle on. Not uncommonly

landlords have been obliged to postpone their claims, even for a reduced rent, until after the growing crops shall have been turned into money, with the knowledge that, in case of failure, there would be no rent forthcoming. These, at any rate, have the advantage of having their lands kept in good cultivation. Other landlords have had their farms thrown on their hands, no tenants appearing for them, and for want of skill in some cases, and for lack of capital in others, and sometimes for want of both, the farms are losing condition and becoming intrinsically less in value from month to month; if nothing else prospers, weeds grow apace. A favourable season is the only chance these men have of attracting good tenants even at a reduced rent. Neither landlords nor farmers can now have any expectation or hope of obtaining high prices for the produce of the land in the future. All that they can rely upon is that they possess the advantage of having the first chance of supplying the home demand; if their supplies are wanting in quantity or quality, their foreign competitors instantly by aid of railways and steamships occupy their places in the market. It has been abundantly proved that there will in the future be no compensation in high prices for bad or indifferent grain crops; it follows that in farming on the existing system in this country any seasons that are not fairly good must bring disaster to landowners and farmers. For several years by reason of unfavourable weather there have been bad yields, without, however, any approach to prices that could be regarded as high. It was acknowledged that the last stage of exhaustion had been reached. If relief did not come, in the shape of good crops, there must be widespread ruin; and a ruin not affecting farmers and landowners only, but spreading to the dealers and shopkeepers from whom they obtain supplies, and through them to the wholesale merchants and manufacturers. It is therefore most satisfactory to find that, while it cannot be said that the season of 1880 will be adjudged to have been a year of abundance, yet the estimates of its produce already made can leave no doubt but that on the whole the yield of the land, in spite of many heavy drawbacks, will be found to be greater than those of any of its three or four immediate predecessors. An early harvest is almost invariably a good one, a late harvest is always a bad one. An early harvest means that the spring found a strong plant upon the ground, that all the stages of development and ripening have been gone through and have succeeded each other rapidly, that there has been no check from disease nor delay from wet weather, and that the plant has consequently had an uninterrupted and vigorous growth, and that the grain has been ripened and dried at the earliest possible time. A late harvest, on the other hand, declares that there has been weakness or disease of the plant at some stage, or perhaps the want of a temperature sufficiently high to ripen the grain; or worse, rain may have fallen at the very time when hot weather was required, and thus not only have delayed the ingathering, but also have done irretrievable damage to the crop. Thus when we find this year that in the early days of September there is still much corn in the fields and very little in the markets, we may well suspect that all is not so good as it might have been. If we look back, we remember that the winter left us with a regular plant upon the ground in apparently a healthy condition; that it came into ear fairly early, but with some irregularity as to time and as to height, which recalled to our minds the sodden state of the soil in which it had been planted, as a reason for any defect; that all went tolerably well until the heavy rains of July wrought much mischief, especially in the Midland districts, by breaking down the stalks and developing mildew, rust, and such like diseases, and by delaying the ripening of the crop. Subsequent short periods of forcing weather gave rise to hopes of gathering a generally well-ripened crop, whatever may have been its defects; but the sunless character of the weather during and up to the last week of August has destroyed these expectations, and whatever may be the yield as to quantity, we fear that the bulk of the crop, unless where farmers have exercised the greatest patience, will be found to be in a moist condition and lacking in those constituents which are of most value. This is the more unfortunate as such produce is never saleable, nor acceptable to the consumer when offered in competition with dry grain of foreign growth. The money yield of the hay and grain crops of 1879 in this country was so disastrously bad because the hay crop, though large in quantity, was so ruined by the rain as to make it almost valueless as fodder, and the grain was so unripe, and its condition so damp (the crop being at the same time very small in quantity), that purchasers would take it only at very low prices compared with what was paid for dry foreign grain. Thus during the winter months home-grown wheat which, if properly ripened and dried, would have brought as much money as certain sorts of foreign corn that were used in substitution, had to be sold at 15s. or 20s. per quarter less than they fetched, a loss to the farmer which may be entirely attributed to the want of warm weather at the harvest-time of last year. Barleys, in the same way, were damp, stained, and blighted, and there was a difference of 20s. per quarter between the best, and they were not so good as the best foreign, and the inferior qualities. On the small crop of last year the lack of dryness alone must have cost the farmer at least two or three pounds per acre, more probably, in every case, than the rent of the land. A prolonged harvest is very expensive, as it entails the constant employment of labour during the whole time it is in progress. The loss from lack of condition this year will not be comparable to that of last year, but it is even now too soon to say with any certainty what its amount will be. It is very certain, however, that the value of the 1880 crop of grain has been very appreciably diminished by the lack of sunshine during August. The delay in the ingathering renders it most difficult to arrive as yet at any certain determination as to the quantity. Reports vary much even in the same district. There are crops this year which will yield largely. Barley and oats will give higher proportionate results than wheat. Probably barley will be found to be the crop of the year in quantity, though in quality for want of sunshine it will be found wanting. Wheat in some cases gives a bountiful yield on threshing, while in others it is said that growers are much deceived and disappointed. Taking into consideration the damage that has been done in wide and fruitful districts, the yield cannot be expected to exceed, even if it reach, an average.

From what has been said it will be clear that the difference to the farmer on a comparison of the results of 1880 with those of 1879 will be enormous. The loss he suffered from failure in quantity and quality in 1879 was very great; cases are quoted in most districts of the whole money return of the grain crop of certain farms being only one-fourth, or even one-fifth, of what they yield in fair years. To put such cases into figures—on a farm where the tenant has been accustomed in years of average yield to realize about 10,000*l.* for his corn crop, he received last year less than 3,000*l.*; in another case, where the receipt was 7,000*l.*, the 1879 crop sold for 1,600*l.* In each of these farms, if prices should be at about the level of those of former years of fair yields, the tenants would probably obtain for their crops of 1880 the larger sums named. Are they, then, likely to obtain such prices? Judging from the experience of the past year when the European crop was generally bad, and speaking of wheat, we should say that the expectation must be for low prices, even perhaps for very low prices. France has a fair crop, and will not require anything like the imports of last year, and the area supplied through the Belgian and Dutch ports will require comparatively small shipments. The falling off in the demands of Western Europe will set free a large proportion of the American surplus, of which practically this country will be the only considerable purchaser. America has, it appears, at least as much to spare as she had last year, and more perhaps than her home consumption and that of Europe can take off. The stocks of the world are very low, and it may be that, if wheat becomes cheap, large reserves may be established on the chance of a bad crop occurring next year. If, however, the Americans are determined to convert the whole of their crop into money, very low prices may be expected to prevail. The Report of Messrs. Pell and Read contains matter of the greatest importance with regard to the price of wheat landed at Liverpool, though their estimate of the amount that will afford a profit to the American grower seems to be at variance with those of other authorities. It is certain that, counting on only a moderate supply from America, the wheat crop of the world assures sufficiency, if not plenty, and our farmers must therefore expect to receive low prices for wheat. Barley is universally a large crop, and the price would therefore, under any circumstances, be low, and the abolition of the Malt-tax—or, rather, the transfer of the duty from barley to beer—will, by encouraging the use of cheaper materials and of the inferior barleys of foreign growth, diminish the demand for English malting barley, so that for this article the farmer must expect a low price to prevail. The price of oats depends very much on the value of maize, and on this crop it is too early yet to obtain information, but on the presumption that the crop will be a fair one, as oats are a heavy crop generally, the range of price must be moderate. On the whole, then, farmers must make up their minds to accept low prices, which, however unsatisfactory to them and to their landlords, will be regarded with equanimity and satisfaction by people who are not landowners or farmers. But in the result the depreciation in the value of arable land which has already taken place will be confirmed and generalized. There is nothing in prospect to attract capitalists to invest in farming operations in the corn-growing line.

THE POLICE REPORT FOR 1879.

THE Report of the Commissioner of Police for the metropolis is always a more or less interesting document. Grumblers say that the elaborate tables of all sorts of things which it contains occupy policemen in their preparation a good deal more time than they are worth. It is only fair, however, to point out that these very statistics go far towards vindicating the police from the charge of remissness and inefficiency, which is a kind of stock charge against them. The famous cry of, "Where are the Police?" could only be completely obviated by detailing a constable to follow everybody and another to stand sentry before every house—duties which it is perhaps not very easy for ten thousand men to perform in a population of four millions. In some cases, no doubt, the force is absurdly inadequate to the work. In new suburban districts this is specially the case. One of the Divisional Superintendent's reports before us speaks of a district in which one beat takes two hours and a half, and another three hours and a half to work. The mere statement of the fact is enough to show that the unfortunate policemen charged with these beats simply could not do their work unless they were capable of dividing themselves into half a dozen. On the whole, however, there is no doubt that fair protection to person and property is given by the force, especially when the total absence of anything like a regular system of police supervision is remembered. Nothing is less

tolerable to Englishmen than such supervision, and we must in this as in other things take the broad with the long.

Sir Edmund Henderson has the usual details to give as to the increase of the city under his charge—21,589 new houses were added to London last year, and about 234 new policemen were put on to meet the increase. These houses, if arranged side by side opposite each other, would cover a street more than seventy miles in length. London was rather less drunk and disorderly in 1879 than in the year before, but it was somewhat more violent. As usual, a fatal accident happened in the streets on an average one day out of every three, while an increasing number of victims were injured more or less severely. It is rather surprising to find that nearly ten thousand lost children were reported to the police, and that two-thirds of these were found by them. Of the remaining third, only twenty-five failed to reach their homes in one way or another. 1879 was a specially suicidal year, which, considering the dismal weather and the general depression, is perhaps not much to be wondered at. No less than 259 persons carried their disgust of life to the furthest extreme, an increase upon 1878 of fully fifty per cent. It is somewhat remarkable to learn that the attempts to commit suicide were not so very largely in excess of the actual suicides. Four hundred and four such attempts are recorded; so that apparently about two in five would-be suicides have resolution and forethought enough to carry out their design. Turning to a more cheerful subject, it is satisfactory to learn that common lodging-houses—not model dwellings of the fancy class, but actual common lodging-houses—are being built on a larger scale and of a better kind than formerly. Sir Edmund speaks of one at Poplar arranged for over four hundred lodgers, and containing very superior accommodation. Readers of that curious book *Sketches in Shady Places* will know how to appreciate this. With regard to cabs, the Hansom continues to increase and the Clarence to decrease. But of the cab of the future, the open, but moderately closable, Victoria, or something of the kind, there is yet no sign. That the conduct of our fathers in providing no facilities for lunatics who might have wished to look about them at hideous buildings and to imbibe freely pestiferous air was reasonable no one will deny. But now that some pains have been taken to beautify London and to clear its atmosphere, it might seem not wholly wild and foolish to provide means of seeing it. The Director of Criminal Investigations has nothing particular to report except that he dealt with 40,128 official letters during the year, "necessitating uninterrupted application." If this is an appeal for sympathy, we fear that Mr. Howard Vincent is not quite certain to get it. Uninterrupted application at office hours is, if only by courtesy, expected from paid officials and professional men generally, and we do not apprehend Mr. Vincent to mean that he is obliged to sit up all night over his letters, or to adopt the pernicious practice of reading them at meals. In the various tabular statistics of the police force itself, the most noteworthy item is that there is a police constable who entered the force in 1834. The imagination cannot avoid lingering over this aged constable, coeval as a policeman with the most famous of port wine. Are there no arrangements for pensioning constables of forty-five years' service? How does this '34 constable come not to be a Superintendent or an Inspector, or a sergeant at least? The Report gives us no means of answering these questions, and as bad conduct would surely in forty-five years have turned a man out of the force altogether, we can only suppose that in the police, as in other professions, the influence of the great goddess Luck is all-powerful.

There are two points in this Report, one of them old, the other new, which seem to deserve some special attention. For many years the police have been endeavouring to impress upon the public generally that he who wishes not to be "burgled" must resort to the ordinary and usual, but strangely neglected, methods of keeping out the burglars. These latter professionals have been defined as useful public servants who, for a consideration, impress practically on the mind of the public the necessity of keeping doors and windows shut. It would perhaps be more strictly correct to say that they fail to impress the mind of the public with this necessity. Something like twenty-seven thousand doors and windows were found by the police open or insecurely fastened during the year 1879. Now, it is hardly necessary to say that the doors and windows open to the comparatively cursory inspection of the police are by no means so numerous as those of which the active and persevering cracksman can avail himself. It would not be extravagant to assume that for every one of the first class there are two or three, if not four or five, of the second. There are few cases in which anything but the front of a house is exposed to the police, while the burglar, as a rule, modestly prefers the back. As it is, of the nine hundred houses broken into in London during the year, six hundred, in round numbers, were empty, and the divisional reports go to show that of the remainder a very considerable number must have been in a condition more inviting to the burglar than otherwise. Superintendent Draper, of the D division, asserts that in every case of burglary in his district the premises were left unattended to or were insecurely fastened. Superintendent Harris, of Hampstead, quotes an instructive instance in which the operators tried one house and finding it well fastened up, transferred their attentions next door, where the unguarded crib was cracked with ease. In the Kensington division, twenty-two out of forty-nine burglaries are set down to demonstrated weakness and inefficiency of fastening. Superintendent Fisher, yet more suggestive than his brethren, points out that it is not sufficient to have fastenings, but that the fastenings must be good. This point is perhaps worthy of more attention than it often receives, and the question what is a good fastening is one not very easy to answer. It may be said generally that door-fastenings in ordinary houses are almost superfluously strong and window-fastenings dangerously weak. A door will often have an ordinary catch, a latch, a huge lock, bolts top and bottom, and a chain thick enough to hold an ironclad, while neighbouring windows, in reality quite as accessible, are furnished only with the ordinary slip catch, which, as most people know, a stout pocket-knife thrust between the sashes will generally unfasten. The older-fashioned and much safer screw through the two sashes is now but rarely seen, probably because it gives so much trouble in opening and shutting.

The other matter to which we have alluded is a more awkward one to handle. But as a prominent place is assigned to it in the Commissioner's own Report, as it is dealt with at great length by the Superintendent whose division is specially affected, and, as a great many people know only too well the nuisance referred to, it seems to require some notice. Sir Edmund Henderson remarks that "the closing of certain places heretofore resorted to [by women of bad character] has had a tendency to throw additional numbers of them into the public streets, and to increase the annoyance consequent on their presence." Superintendent Dunlop comments upon and supports this statement in the fullest manner. At midnight, he says, and from thence onward till 2 A.M., one side of the lower part of Regent Street, and the narrow strip of Piccadilly in front of the Criterion, become impassable from the vast number of disreputable promenaders. For the most part the police cannot interfere, because there is no technical disorder. Those who are taking part in the promenade naturally do not complain, while other passengers are only too anxious to get out of it as soon as possible. The proprietors of respectable places of refreshment in the neighbourhood are at their wit's end, because it is practically impossible for them to preserve order, and their establishments get an undeserved bad name. It is, says the Superintendent, very justly, intolerable that respectable people should not be able to walk the streets without annoyance, and this they most assuredly cannot do at present. It used to be made an argument against a certain very well-known, and now closed, place of resort, that there were unedifying scenes in the street at the hour of its closing. The chief result of that closing appears to be that the unedifying scenes now go on for the best part of two hours over great part of one of the principal thoroughfares of London. In short, the aspect of the district described by Superintendent Dunlop must be admitted by every one who has had occasion to traverse it at the time to be simply a disgrace to the capital. The question of course is a difficult one in many ways. The amiable clergyman who is persuaded that the chief use of the Argyll Rooms was the hatching of burglaries will not be persuaded to regret their closing by any of the arguments alleged by Superintendent Dunlop. For it may be admitted that the hatching of burglaries on the pavement of Waterloo Place is, except as an exception, not very probable. But it certainly stands to reason that, so long as the law takes no direct steps to suppress a certain class of persons—putting aside for the moment the question of the possibility of their suppression—but merely hunts them out of certain resorts, they will go elsewhere. At present the one elsewhere in which they enjoy tolerable freedom from interference is the public street. Public-house keepers are sternly admonished not to "harbour" them; semi-public places, whither by a sort of convention nobody goes who objects to their society, are frowned upon and closed. But the streets, which might be supposed to be the particular sphere of operation of the guardians of public decency and morality, are free. Short of an actual row—which indeed occurs pretty frequently—the police cannot interfere, and all the elements of such a row are allowed to exist quietly, or rather noisily, ready for the spark that is to kindle it. Meanwhile the belated traveller who wishes to go from the Guards' Monument northwards will do well to seek cunning byways, if he objects to uninvited caresses, and the meditative foreigner on his way to Leicester Square has a fine opportunity of considering the methods taken by the magistrates and police of moral Britain for the better prevention of scandals.

A TENOR'S DIARY.

PROBABLY in no artistic calling is success more pleasant and in every sense remunerative than in that of singing, and especially of operatic singing. We have heard it insisted upon by a well-known comedian that on the lyric stage acting ceases to be acting; that it is, so to speak, a mongrel entertainment; that the peculiar exigencies with regard to gesture and expression created by the music deprive the histrionic attempt of any true value, and so forth. The public, however, are not likely to take this view, nor can it be denied that there is a science of operatic acting, different it may be in details of technicality from the more usual form of acting, but in the estimation of amateurs of equal value and equal importance. Indeed, a person paradoxically inclined might support a contention that acting is of more importance on the lyric stage than singing, by quoting two or three well-known instances of Italian and German singers whose reputation and success have certainly been due more to their histrionic than their musical powers. It would of course be still easier to make a counter list of operatic singers in whom the

charm of voice and method has overcome their utter incapacity or indolence with regard to acting. It would be trite, but for the strange opinion of a theatrical expert above referred to, to say that the combination of the two gifts of musical and dramatic talent, assiduously cultivated, makes the singer. This combination, it is worth while to note, is more rare among tenor singers than among sopranos, contraltos, baritones, and basses—possibly for the mere reason that tenor singers seem likely to share the fate of the dodo. It was possessed, or rather acquired, by one great singer of our own time who is still living, and it seems to have been possessed by the great French tenor Roger, whose line of part was, in the heyday of his success, practically the same as Signor Mario's. Roger's *Carnet d'un Ténor*, just published (or rather republished, for its materials have appeared from time to time in the *Figaro*) in Paris, is full of curious anecdote and information; and, besides bearing unconscious witness to its author's attractiveness and accomplishments, has a special interest for people who are interested in the study or science of acting. M. Roger's road to success differed from that of the great tenor to whom we have referred in two special points. He began by being a light tenor at the Opéra Comique, and rose to be the first tenor at the Opera-house of Paris; and he possessed by nature, to judge by his Diary, that histrionic talent which, in Signor Mario's case, was developed and brought to perfection by the exercise of an industry which illustrated the old proverb about genius and taking pains. M. Roger's career, so far as his connexion with the Opéra Comique and his subsequent leaving it for a larger stage go, was not unlike that of M. Capoul. M. Capoul has, in fact, done exactly what Roger did. He has, in Europe at least, abandoned the heroes of light French opera to assume such parts as Faust in M. Gounod's opera, and, on occasions, Raoul in *Les Huguenots*. In what degree his success can be compared with that of M. Roger is a question which can be determined only by amateurs or experts who have heard both singers.

Roger's first appearance in the part just referred to, Raoul in *Les Huguenots*, was one of the most striking and, one might add, the most trying, incidents in his career. He was in London in 1848, under an engagement with Messrs. Webster and Delafield to appear as a *primo tenore*; but his having to sing Raoul at a few hours' notice was naturally as unforeseen by his managers as by himself. The event is thus recorded in his Diary. "Thursday, August 3rd. *Dies albo sigillanda lapillo!* The *Huguenots* was advertised this morning for Mme. Viardot's benefit. At one o'clock Gruneisen came and told me that Mario was ill and might be unable to sing. He went away at four and came back to beg me in the name of the managers to take Mario's part, Raoul. I was thunderstruck. I observed that, as I had only just left the Opéra Comique, and was not yet enrolled on the staff of the Opéra, I had naturally not even rehearsed Raoul. Gruneisen not the less pressed his point, and I was compelled to make a hasty decision. I knew the score, but if I played the part I risked my future. Finally I undertook it, with the one reservation that I should sing it in French; for although I knew Italian well enough, three hours was a short time in which to master the words." Roger was seemingly too nervous to eat any dinner, and felt when he went on the stage "affreusement pâle sous mon rouge." The French words at first took the audience by surprise; but as the opera went on the tenor's success became more and more assured. "Dieu s'en mêle; tout marche supérieurement, et le terrible septuor du duel est bissé." Mme. Pauline Viardot (who sang the great duet in French) and Roger were both rapturously applauded, and after this duet received and, we regret to add, responded to three recalls. In the fifth act Roger forgot his part to some extent, but "j'ai remplacé quelques passages du chant par une pantomime noble et bien sentie." It is quite likely that the tenor's frank confession may be the first intimation of this curious fact to those who may remember his appearance on this occasion.

The next entry to this "day to be marked with a white stone" is headed by the ominous words "jour néfaste," which is curious as exhibiting that fine artistic conscientiousness of Roger, who had been singing in *Guillaume Tell*, to which allusion has already been made. "Je n'ai rien fait de honteux," he writes. "Je n'ai pas chanté faux. Pas un couac. Mais tout était étriqué, sans chaleur." He had gone through his part creditably, even in his own estimation, but he had not felt that he had really assumed "la peau du bonhomme," and he was accordingly discontented. The entry is curiously like some which are to be found in the diary of Macready, to whose histrionic method that of Roger seems to have been closely allied. One learns from other passages in the Diary that, like Macready, he felt the need of actually believing in the reality of every part which he assumed, though he at the same time held the views which are found in Hamlet's address to the players, and at greater length in Diderot's *Paradoxe sur le Comédien*. This feeling on the singer's part is curiously marked in a passage concerning his rendering of John of Leyden (a part which, with Meyerbeer's special sanction, he "created"), and it is worth noting that, like Macready, Roger recorded his successes and his failures, according to his own impression, with absolute impartiality:—"Je jouais le *Prophète*," Roger wrote on the 14th of September, 1851, ". . . . Au quatrième acte j'ai été pris d'une hallucination singulière; je subissais un des vertiges fantastiques d'Hoffmann. La couronne en tête, le manteau impérial sur les épaules, je me suis cru, pendant un instant, véritablement prophète et roi. Oh! le bel art! et que je l'aime, ce théâtre, qui de nos royautés factices parvient à nous en faire une réelle!" This, it will be admitted, is a not uninteresting record in itself, and has a special interest in connexion with the fact that Roger, much as he loved to feel himself the "personage" he was called on to play, held, as has been suggested, the same views as to the necessity of an actor's self-control which were admirably formulated by Diderot, and have more than once been endorsed in these columns. Shortly after the entry just given comes one which, at the risk of seeming to make too many quotations, we feel constrained to reproduce because it illustrates, as nothing else short of a careful reading of the *Carnet* could do, the truly artistic, one may even say the truly poetical, feeling and genius which was a striking element in the character of the great tenor. It was at Berlin that he experienced the strange and delightful sensation of being for the moment the person whose triumphs and sufferings he had to represent with voice and gesture; and it was at Dresden, a few weeks afterwards, that he wrote the passage we are about to quote. It is a description of a work which many writers, great and small have attempted to describe; and to people who have read with varying feelings these various descriptions, its force and simplicity will probably recommend themselves. "Aussi," wrote M. Roger, "quand j'arrive devant la vierge de Raphaël, celle qu'on appelle la Madone de Sixte, tout en moi est satisfait. Elle vous arrête, cette grande femme au regard bon et fier, si bon, parce que c'est celui de la Mère, si fier à cause de l'enfant qui a l'air de trôner sur les bras qui le portent. Quant aux yeux de Jésus, rien n'en peut rendre la merveilleuse expression. Sans cesser d'être ceux d'un enfant, ils sont surtout les yeux du maître du monde." We must break off the quotation at this point to say that it is difficult to our mind to conceive a happier and more delicate description of perhaps the most wonderful expression that Raffaelle ever conveyed on his canvas. Yet to these words which we have quoted M. Roger has something to add. "Ils vont droit," he goes on, still speaking of those marvellous eyes, "dans les profondeurs de l'infini, qui alors s'y reflète. Ce sont deux temples ouverts que ces yeux! Il n'y a pas à dire, un Dieu est là!"

After the consideration and quotation of this passage, which it is not too much to call a brilliant piece of writing, we feel a certain disinclination to revert to the daily record as it is of M. Roger's operatic experiences in Dresden, where, by the way, he met the still celebrated actor Emil Devrient; nor are we indisposed to end our remarks on Roger's journal with this passage. It shows, to our thinking, conclusively, that he had the great artistic talent, we might even say genius, which, as it happened, he devoted to the lyric stage, but which, if he had not possessed a tenor voice, would have made its mark in some other artistic calling. In these few observations on a remarkable book we have given but a faint idea of its interest and value.

RUSSIAN POWER IN THE NORTH PACIFIC.

THE remarkable article in the current number of the *Edinburgh Review* on naval power in the Pacific, seems scarcely as yet to have awakened the interest it deserves. It certainly merits attention, as the subject is an important one, and as it is treated in a masterly manner by the writer, who first points out the enormous proportions which British trade in the Pacific has now assumed, next gives an account of the manner in which Russia has gradually acquired a most valuable portion of the north-eastern coast of Asia, and then describes, in part from personal observation, the great strategical strength of the position she now holds. The author is no alarmist, and writes in a tone of singular moderation, sometimes indicating rather than stating the dangers to which the commerce of this country might be exposed in the event of a war. Unfortunately the facts which he brings forward speak for themselves only too plainly, and it seems clear—as has indeed several times been said—that, in the event of a war, Russia might be able to do terrible harm to the trade of Great Britain in the Pacific. Her strength is all of recent growth, as, at the time of the Crimean war, she was able to do nothing, although the exploits of the British navy in the North Pacific were assuredly not calculated to frighten a bold foe. First, there was the repulse of Petropaulowski, then the affair of Castries Bay, respecting which, we may observe, the writer in the *Edinburgh* is misinformed. British men-of-war sighted Russian ships at this place, but, for some reason which has never been clearly explained, did not engage them. After this a Russian frigate managed to escape from the not very vigorous British pursuit through the shallow water of the northern entrance to the Amoor. Nothing whatever beyond capturing some officers and men belonging to a vessel which had been wrecked did the British navy achieve against the Russians in the North Pacific; but the latter were well content to escape, and were without the means of acting on the offensive. Very different would be the case now should war break out. Russia has increased her territory on the North Pacific coast, and has acquired a magnificent harbour, where, of course, she has placed a garrison which, it seems, is being strengthened. In this place she possesses an excellent base for naval operations, and, as she has another very good one and several smaller ones in the long line of coast which she holds, it is clear that she now has a position in the North Pacific which would enable her in a war to

give this country a great deal of trouble, and possibly to inflict irreparable injury on our commerce.

How she acquired this position is briefly and well told in the pages of the *Edinburgh Review*. It is the usual story of noiseless activity, of slow, but unceasing, aggression. The Russians gradually advanced to the coast, and, after their fashion, made a treaty and disregarded it. At the time of the Crimean war a large portion of the lower Amoor nominally belonged to China, the Russian boundary running some distance to the north of it; but the Russians had established themselves at its mouth and on the coast to the south. Having thus, according to the old maxim, nine points of the law on its side, the Russian Government waited in its usual patient manner until the opportunity came, and then proceeded to secure the remaining fraction. In 1860 they were able to legalize the position they had obtained by fraud and disregard of their own promises. The writer in the *Edinburgh Review* says:—

In 1858, by the treaty of Aigun, China ceded to Russia the left bank of the great river down to the confluence of the Usuri, and below that point both banks. This treaty was afterwards disavowed by the Chinese authorities, but their difficulties with France and England, whose armies occupied Peking, enabled General Ignatief to obtain a second treaty in November, 1860, which confirmed his sovereign in possession of the territories above named, and more minutely defined the boundaries. "This acquisition of territory," said a writer in this Journal [*Edinburgh Review*, No. cclxxviii., p. 307] eight years ago, "magnificent as it was in the vast extent of country thereby added to the Russian dominions, had its chief value—for the moment at least—in the fact of its conferring the long-coveted advantage of accessible harbours on the Pacific in a comparatively temperate latitude, where navigation is impeded by ice for at the most three or four months during the year. The southernmost gulf of the newly ceded region, lying in latitude 43° N., contains numerous fine harbours and inlets." The river Tumen was now the southern boundary of Russia in these parts, and divided its province from the kingdom of Corea. The territory has been finally rounded off and completed, as it were, by the treaty with Japan, made in 1875, by which the latter cedes to Russia, in exchange for the Kurile islands, the southern portion of the great island of Sakhalin.

The value of the territory thus acquired is, from every point of view, great; but its value to Russia, as a naval Power, it would perhaps be impossible to overrate. In the long strip of the coast between the mouth of the Amoor and that of the Tumen are frequent harbours, some of which are not only secure as anchorages but also defensible. Principal amongst them are Olga Bay and Vladivostok. Olga Bay has been described by Captain Bax, who visited it in the *Dwarf*, as having an outer and an inner harbour, the outer one being quite safe. Good as this haven is, however, it is surpassed by Vladivostok, of which the following account is given by the writer in the *Edinburgh Review*:—

Vladivostok, or the "Dominion of the East," lies in the deep bight formed in the coast line some seventy or eighty miles from the mouth of the Tumen river. We speak from personal experience when we say that this harbour is one of the finest in the world. There is an outer anchorage, which is a fairly snug roadstead, called the Eastern Bosphorus. From this runs direct to the right the inner harbour, called the Golden Horn, after a less convenient, if more celebrated, port in Europe. This is about three miles long, and not much above half a mile wide. The largest ships can ride within a few yards of the shore. The peculiar form of the port renders its defence by torpedoes and batteries easy. Several of the latter were erected in 1877, and it is reported recently that a considerable number of torpedoes have been constructed in Japan for conveyance to this and other places in Maritime Siberia. . . . . . The civil population is not large, and is composed principally of Chinese and Manchoos, who are credited by the Russian officers with being, in general, fugitives from justice. A large number of female convicts from European Russia are settled here. The garrison consists of an *équipage* or "ship's company" of seamen, which answers to a regiment of soldiers, and amounts to about two thousand five hundred men. According to the latest accounts this garrison, with the seamen stationed there, has been notably strengthened. These not only supply the force necessary for the defence of the place; they also form the crews of the Siberian division of the fleet. It is believed that the harbour is only frozen over from late in December to the middle of February.

It is clear then that the Russians possess in this district a port which can scarcely be surpassed; but the best port on a remote coast might not be of much value as a naval station, if it could not be supplied with coal from the interior, as a blockade might intercept a great proportion of the coal ships bound for it. Fortunately for the Russians it is perfectly possible to obtain coal for Vladivostok. Near to it is a seam of coal, but this, it seems, is not of good quality. Further inland, however, there is excellent coal, and though this is at some distance, transport is made easy, according to the writer in the *Edinburgh*, by direct river communication, and the harbour will therefore be supplied with the great essential for modern naval warfare, and will form with the harbour of Olga Bay and with the other lesser ones as perfect a base for naval operations as admirals and captains can desire.

These ports have, it is true, one great disadvantage. They are closed during a portion of the year by ice, so that fleets would be for a time shut up in them, while commanders who remained too late at sea would run the risk of finding their retreat cut off. It has been seen, however, that, so far as regards Vladivostok, that period is probably a short one, and that the harbour is in all likelihood open for ten months of the year. With so short a close-time great activity would be possible, and it would be difficult to exaggerate the harm which might be done to British trade in the Pacific by vessels issuing from this port. It is scarcely necessary to refer to the oft-cited case of the *Alabama*; but when the mischief which that one vessel was able to do is remembered, some idea may be formed of what a number of fleet cruisers could effect. Of course they would be chased by British men-of-war; but the Pacific is a wide sea to chase vessels in, and too often might the hunt be fruitless. Of course, also, the ports would be blockaded; but there would be great difficulties in the way of a blockading squadron, and these we will endeavour to indicate, supplementing slightly the facts brought forward by the writer in the *Edinburgh Review*.

In the first place there are the summer fogs, which are very common on the north-eastern coast, and would, as he justly observes, tell in favour of the blockaded vessels. If, indeed, these were commanded by men ready to run some risk, their escape during a fog would be extremely probable. The writer is mistaken in supposing that the escape of the ships seen in Castries Bay was due to fog, for, as has already been stated, they were sighted, but were not attacked. That, however, he is perfectly correct in saying that fogs are frequent in summer we can testify from experience of these seas. There is, moreover, another difficulty for a blockading squadron on this coast. Even in summer time gales are frequent, and a gale is a sad enemy to vessels watching a port. Further, there would be the great difficulty of obtaining coal, and this would prove, if not insuperable, probably a difficulty of the gravest kind. As is pointed out in the *Edinburgh Review*, our nearest coaling station in the event of a war would be Hong Kong, distant 1,600 miles from Vladivostok. We need hardly observe that steam-ships are infinitely less independent than the old sailing ships were which could carry provisions for a long period, and only required occasional supplies of water. If ample means were given by Government, it would no doubt be possible by great energy and great care to keep up the supplies; but the task would be an arduous one, and very serious would be the position of a commander who found that his coal was running short, and that he must choose between abandoning the blockade and incurring what might prove to be terrible risk.

The grave nature of the results which might follow if an effective blockade could not be maintained, and if Russian squadrons could take the sea, can hardly be over-estimated, and, lamentable as it seems, nothing whatever has been done to prevent an enemy from carrying by a *coup de main* the only place we hold which would serve as a base for operations in the North Pacific. Coal is to be found at the mines of Nanaimo, in Vancouver's Island, and a small dockyard is maintained at Esquimalt, but this appears to be almost defenceless. Respecting it the writer in the *Edinburgh Review* is able to bring forward the evidence of General Selby Smyth, commanding the military forces in Canada, who, in a recently published report, says:—

In the event of war, Russia would be in a position to harass not only Hong-kong and the China and Japan trade, but to send a squadron across the ocean in thirty days to attack the western sea-port of the Dominion. Our security in the Pacific requires Esquimalt to be well guarded; our fleets must keep the sea, if necessary, in all weathers, and they cannot do so without coal. That important element is in ample stock and of prime quality at Nanaimo. The British navy is scattered over the Pacific, and there were no works of defence at Vancouver till last year; no forts for the protection of our coal; nothing but British prestige and a few companies of militia at Victoria and up the Fraser river.

Some heed should surely be given to this warning, as also to the possibility of England's having to undertake armed mediation in the event of a war between Russia and China, and requiring, in consequence great naval strength. Want of space, however, prevents us from entering on this subject, and for the same reason we must leave unnoticed many of the important facts adduced in the article in the *Edinburgh Review*. Those which we have mentioned certainly suffice to prove that the writer makes out a very strong case, and shows how dangerous to this country is the strength of Russia on the north-western coast of the North Pacific. Any one who wishes to realize what her increase of strength has been, has only to compare the menacing position she now holds with that which she held at the time of the Crimean war. Then, although our squadron in the Chinese waters was not a very powerful one, and was certainly not commanded by men of great energy and enterprise, the Russians were only too glad to escape in safety. Now a strong fleet would be required to blockade their ports, and to prevent them from doing incalculable harm to our commerce. Even those who most contemn alarmist cries can hardly deny that the change in relative position is an extraordinary one, and that the present strength of Russia in the North Pacific is of grave import to this country.

A DECADE OF RAILWAYS.

IN making their General Report to the Board of Trade on the Financial Position of the Railways of the United Kingdom Messrs. Calcraft and Giffen have this year extended it to include a comparison of the last ten years, from 1869 to 1879. These years, they tell us, "embrace a full cycle of prosperity and adversity, with the exception, perhaps, that in the year 1869 railways had already begun to improve a little from previous depression, while 1879 has been absolutely the worst year of the recent depressed period." As would be expected, the cycles of depression and revival in the railway world are analogous to those in the mercantile world generally; and it would seem, so far as statistics can show us, that there is fair reason to hope that a substantial improvement in railway matters is at hand. Indeed, the increase in the value of shares of many of the most prominent railways shows that the public has begun to realize this important fact. Since "1879 has been absolutely the worst year of the recent de-

pressed period," it is of the greatest interest to see in what way that year differs to its immediate predecessor 1878, and this is very concisely shown by the admirable summary table that Messrs. Calcraft and Giffen have supplied in their Report. By this we see that while there is an increase of 18,458,315*l.* of capital in 1879 as compared with 1878, making an increase of 217*l.* per mile of railway open, there is a decrease in gross receipts amounting to 1,085,971*l.*, and at the same time a decrease in working expenditure of 1,144,095*l.*, by which means an increase, astonishing to relate, of 58,124*l.* is the nett result. It will be seen, therefore, that it is through the decrease in working expenditure alone in 1879 that the nett earnings show an increase over the year 1878, and this in the face of the fact, as pointed out later on in this Report, that the same quantity of work done now is more costly than it was ten years ago. It would be interesting to the general and non-railway public to have before them at the same time the statistics of the number of accidents that had taken place during the same period, which were clearly due to reduction of, or overworking of, the staff of a railway Company; but we are unable to afford those particulars which might have anything but a reassuring effect upon the minds of travellers. This would not be worthy of much notice if the reduction had only been between the two years 1878 and 1879, but it is not so. The reduction of working expenses has been going on for some years; and, as Messrs. Calcraft and Giffen remark, there is in 1879 "a similar but rather greater reduction" than in 1878. If we turn to the table of work expenses during the last ten years, we find, however, that the increase is that of 53 per cent. upon an increase of capital in the same duration of time of 38 per cent. This, as we said before, is largely accounted for by the fact that work done now is more costly than it was ten years ago. When next we come to the table giving the comparison of the rates of interest and dividend paid on ordinary, guaranteed, and preferential capitals and loans and debenture stock for the year 1879, we find that 62 per cent. of the total capital pays from above 4 to 13 per cent., and 21·5 per cent. of the capital returns interest at from below 1 to 3 per cent., leaving 16 per cent. without interest. In the guaranteed capital we find that 52 per cent. of the total capital pays from above 4 to 10 per cent. and 46·5 per cent. of the capital from above 1 to 3 per cent., leaving 1·5 per cent. which pays nil or under 1 per cent. The preferential capital again shows that 54·8 per cent. of the capital pays from 4 to 12 per cent. and 40 per cent. returns from 1 to 3 per cent., whilst 5·1 per cent. returns from nothing to 1 per cent., the defaulting capital in this case being as much as 5 per cent. On loans and debenture stock the interest is lower on account of the security, and naturally the percentages are swollen; for instance, 98·6 per cent. of the capital pays from above 3 to 6 per cent., and the remaining fraction returns from nil to over 1 per cent. If the reader has followed this dry statement of facts with ordinary care, he will see the value of railway property generally, and although in his particular case he may have been sufficiently unfortunate in his ventures, he may yet be led to think that railways are an exceedingly profitable investment for public money; for while 22 per cent. of the capital invested in them renders no interest, the remaining 78 per cent. yields from 1 to 13 per cent., the larger portion varying from 4 to 7 per cent. Messrs. Calcraft and Giffen then proceed to give us their statistics for the ten years from 1869 to 1879, in which they show that the increase of mileage is much less than the increase of capital, and that the increase of receipts is much greater than the increase of capital, while, strange to say, there has been a large increase of working expenditure as taking 1869 against 1879. "The final result is," say they, "that, in spite of this large increase of capital, and also of the still larger proportionate increase of working expenditure, amounting to 54 per cent., the return per cent. on the increased capital is just about as great in 1879 as the return on the smaller capital in 1869. Railway shareholders are on the average no worse off on the face of the figures than they were in 1869, while the figures themselves, allowing for the increase of nominal capital only, and for the circumstance of trade having begun to revive from a previous depression in 1868, while 1879 was the lowest point of the depression, may be held to denote a real improvement." After having shown that there is a steady diminution of the proportion of ordinary capital to the total capital of railway Companies during this period, and an increase of the guaranteed and preferential capital, the reporters proceed to the consideration of traffic receipts. Here, taking the ten years range as before, the first thing they notice is the steadiness of the proportion between passengers and goods receipts, the advantage being on the side of goods to the extent of from 9 to 13 per cent. As to passenger traffic, however, the one important fact is the vast increase in third-class traffic. Whilst in the receipts from first-class passengers in 1875 there has been a steady decline from 4,725,000*l.* to 3,888,000*l.*; and from second-class passengers of from 4,925,000*l.* in 1870 to 3,459,000*l.* in 1879; those from third-class passengers have increased from 6,837,000*l.* to 13,869,000*l.* in 1879, which is more than twice the figure for 1869; and, as the Report says, "the increase in third-class traffic alone in that period"—from 1869 to 1879—is, in fact, nearly equal to the amount still received from first and second class traffic together. "For good or for evil," says the Report, "and apart from any explanation of the causes, the tendency of third-class traffic to increase, while first and second class traffic remains stationary or declines, has been most distinctly marked during the last ten years." This judicious reticence as to "any explanation of the causes," especially when the hint is thrown out that there is a chance of evil influence in this third-class increasing traffic, is certainly disappointing; but that such is the fact is sufficient for railway Companies to take example from the Midland Railway, and whilst abolishing the second-class, to improve the third-class accommodation. Minerals, as regards goods-traffic, show an increase of 63 per cent. in the period of ten years, whilst general merchandise gives 44 per cent. and live stock 29 per cent. increase. A large portion of the Report is devoted to the working expenses, which, as we are told, "is perhaps the most interesting question to the railway shareholder," and the conclusion come to is that they have largely increased, because the same quantity of work done now is more costly than formerly. It is shown that the increase is due almost exclusively to the traffic expenses, which, although there is a tendency for them to diminish, though slowly, it remains a fact "that, with the exception of this item, the working expenses of railways are substantially, in proportion to the work done, the same in 1879 as they were in 1869, after having been subjected in the meanwhile to violent fluctuations." It is anticipated by Messrs. Calcraft and Giffen that the proportions of expenses to receipts will be less in 1880 than 1879 as has been the case between 1879 and 1878. The keynote of the Report is the reduction of working expenses, which has worked such marvels as to actually show an increase in a year absolutely the worst of the recent depressed period. Could this be once effected, as indeed the Report holds out some hopes it will, railways might almost consider themselves an insured success, but working expenses are necessary evils, and their reduction may not altogether tend to the safety of the public.

REVIEWS.

BUXTON'S HANDBOOK TO POLITICAL QUESTIONS.*

THE plan of Mr. Buxton's little book, a worthy successor to his father's manual, is a rational and useful one. His purpose is to exhibit, in as clear and impartial a manner as possible, the arguments on both sides of the most agitated questions of domestic policy. No doubt it is hard for one man not to be biassed by his own preference in setting over against one another the reasons of contending parties and schools; and of this Mr. Buxton confesses himself fully aware. Nevertheless his method makes it fairly practicable to hold an even balance, and he appears to us to have succeeded remarkably well. He does not attempt to weigh or discuss the arguments marshalled for and against the various proposals brought forward for examination; but after a colourless introductory statement of the facts necessary for the understanding of the arguments, he states them without further comment in the most compendious form to which he can reduce them. In order to exhibit his procedure distinctly, it may be well to quote in full the treatment of some one point. We take the question of "Illiterate Voters," which occupies rather more than a page under the general head of "The Ballot":—

> It is probable that one point connected with the Ballot will receive some attention; namely, the question whether the illiterate voter who solicits assistance in recording his vote, should be allowed to continue to receive the help of the officer presiding at the polling-booth.
>
> It is contended that this assistance should be withdrawn, on the grounds:—
>
> 1.—That a man so illiterate as to be unable to mark a ballot-paper correctly, is presumably too ignorant to be worthy of a vote.
>
> 2.—That the desire of being able to record his vote will be an incentive to acquire education.
>
> 3.—That it is possible for the voter who claims assistance to make known which way he votes, and so the door is left ajar to bribery and intimidation, more especially as the illiterate voter is likely to be amenable to corrupt influences.
>
> 4.—That illiterate voters are induced to plead illiteracy so that the briber may know which way they vote.
>
> On the other hand it is contended that the illiterate voter who solicits assistance from the presiding officer, should be entitled to receive it, on the grounds:—
>
> 1.—That he represents property, and is as much interested in good government as the well educated voter; while if he were deprived of the assistance necessary to him in recording his vote, he would be practically disfranchised.
>
> 2.—That if he has to record his vote without assistance, he will give it in a haphazard manner, and it may be recorded for the wrong candidate, or be lost from infringement of the rules of voting—either result would be an anomaly.
>
> 3.—That as the presiding officer and those attending in the booths are bound to secrecy, and as proper care is taken to prevent exposure, no infringement of secrecy is possible.
>
> 4.—That as the blind, and those physically incapable of marking the voting paper are assisted by the presiding officer, the uneducated, who are equally unfortunate, should receive the same assistance.

This statement does justice to both sides in a small compass. At first sight *illiteracy* struck us as an ungainly word, but we find that there is good eighteenth-century authority for it. Mr. Buxton does not seem to have followed any fixed rule in his choice of the sort of arguments to be presented. Most often he gives only such as are actually current, or, at any rate, not unlikely to be met with in public discussion. Thus on the question of woman's suffrage a pretty long list of reasons is given both for and against, but the greater part of them strike one as superficial. But the answer to criticism on this ground is obvious—namely,

* *A Handbook to Political Questions of the Day: being the Arguments on either Side.* By Sydney C. Buxton. London: John Murray. 1880.

that such are the topics which speakers and writers on both sides have hitherto preferred to use. Nor is the fact very hard to explain. Thorough discussion of the question would involve a much deeper consideration of the theory and principles of representative government than most people would care to undertake, or an average audience would be likely to follow. Sometimes, however, Mr. Buxton does not confine himself to the reasons which are commonly given, but adds others which, though more or less probable in themselves, and exercising more or less real influence on men's opinions and actions, are little put forward, as being unpopular or in other ways not convenient for political controversy. A good example of reasons of this class is afforded by these against Disestablishment:

11.—On the other hand, many are possessed with the idea that the disestablished Church body being left, as it would be, with extended and uncontrolled powers, and having at its disposal a large capital, would inevitably tend to become an exclusively, or predominantly, clerical body. That all who differed from her dictum would be driven out of the fold, and the Church would split up into innumerable fragments; intolerance and strife would be increased and perpetuated.

12.—That the clergy would tend to become more and more mere servants of their congregations, and much freedom of thought, liberty of ideas, and elevation of mind, would be suppressed and lost.

13.—And that the connection of Church and State is the best guarantee that the religion of the country will be kept broad and comprehensive; while it secures a certain amount of liberty and freedom from ecclesiastical tyranny and dogmatism.

14.—(By some.) That the existence of such a wealthy, powerful, and independent body, as the Church would become if disestablished, might be dangerous to the Commonwealth.

Occasionally, too, lines of argument are traced on a special point with an express intimation that it has not yet been much discussed.

One of the most interesting heads is that of "Land Laws"; the arguments are as well given as in other parts of the book, but some of the introductory statements are loose. It is said that "by the law of entail a landowner can so tie up his land that it cannot be sold, or seized, or lessened in size for a period comprising the lifetimes of any number of persons actually in existence at the time the will was made, and until the yet unborn child of one of these attains the age of twenty-one." The only "law of entail," properly speaking, is the Statute *de donis*, as modified in its effect, first by an elaborate system of fictitious proceedings, and subsequently by the Fines and Recoveries Act. Now this is only a part of the law by which a strict settlement of land, such as has been common in this country for about two centuries, is made possible. It is not so much the power of creating estates tail as that of creating estates for life which is essential to a family settlement. Then Mr. Buxton speaks of "the time the *will* was made," as if arrangements of this kind could be effected only by will, whereas they may equally well be made, and quite as often are, by the disposition of living persons; and the statement of the time for which alienation may be restrained, though perhaps it comes near enough to the usual result for popular purposes, is by no means accurate. Shortly there follows a sentence in these terms: "The power to let the land for a long term of years on strict conditions, though not entail, possesses some of the features of entail, and may be here considered." We do not exactly understand what Mr. Buxton means; surely not the ordinary building lease for ninety-nine years. Nor do we find that anything is specially considered in his reasons on either side which throws any light upon his meaning in this point. The last reason on the side of opposition to change is also rather curious:—

15.—Many who are in favour of the abolition of entail, consider that existing entails, where the settlements have already begun to take effect, must be left intact, on the ground that to interfere with them would be an unjust encroachment on the rights and prospects of the remainder-men.

We did not know that anybody had gone so far as to propose the abrogation of existing settlements, which would be mildly described as "an unjust encroachment." Either you must compensate the remainder-men at the expense of the estate, in which case the settlement is not really abolished, but settled land is turned into settled money by an extension of a process already familiar to conveyancers; or, if you do not provide compensation, you are simply taking away the remainder-man's property and giving it to the tenant for life. One is tempted to suspect that there is a little confusion in Mr. Buxton's mind—it is likely enough to be so in the minds of even well-informed laymen—between proposals for abolishing or greatly cutting down the power of creating limited interests in land and proposals like those of Lord Cairns, directed to the different object of reconciling limited interests with good husbandry by giving the limited owner increased powers of management. This latter class of changes in the existing rules of law, being not fundamental but of an administrative kind, might, without any injustice, be applied to settlements already made. Under the head of Registration, which comes immediately afterwards, it is a rather surprising omission that the experience of Scotland and Ireland as to registration of deeds, and of the Australian colonies as to registration of title, finds no place in the arguments.

The section on "Local Self-Government" is disappointingly short. It consists only of the following series of general propositions and brief comment:—

It is proposed to concede larger powers of Local Self-government throughout the country, on the grounds:—

1.—That centralisation is deadening and demoralising.

2.—That a locality will do better, and more economically for itself, that which is required, than any central body.

3.—That the nation is now sufficiently civilised to be allowed full self-government.

4.—That a highly civilised country is continually requiring more, not less government. New rights and new duties spring up; and these more and more tend to outstrip the powers of supervision of the central body.

5.—That the present boundaries, divisions, and districts are complicated and anomalous; the existing duties, powers, and mode of election of the different local bodies or individuals greatly and confusedly vary; and all require simplification and consolidation.

6.—That in consequence of the confusion of areas and authorities, the burdens of local taxation are unequally borne.

The above arguments seem to be generally accepted as conclusive that something should be done; while there is difference of opinion on the question of the best way of granting more local self-government; in deciding what is to be the unit from which the rest shall diverge; and how far the different bodies should be representative or no.

Mr. Buxton, however, may fairly say that in reflecting the present unformed state of opinion on the whole matter he has done as much as he can reasonably be expected to do.

The licensing law is very fully treated; free licensing, increased restriction on the present lines, the Permissive Bill, local option, the Gothenburg system, and Sunday closing, have each a separate head assigned to them, where persons in search of an argument on either side can hardly fail to find something to suit them. Against the Permissive Bill this point is neatly made:—"That if the principle is conceded that the ratepayers of a given district have the right to forbid a trade or calling of which they disapprove (though the trade may be perfectly lawful elsewhere), logically they could claim a right to forbid unpopular places of religious or political resort to be opened." The approximate symmetry of opposing arguments which Mr. Buxton generally observes is seriously departed from when we come to the question of Sunday opening of museums and picture galleries. Eight reasons are given for the innovation, and only three against. Possibly Mr. Buxton had begun to find strict neutrality monotonous by the time he arrived at this point. Or perhaps he thought it inartistic by excess of symmetry, after the manner of a strange little book we have seen on the rules of drawing the human figure, in which the draughtsman is recommended to avoid an equal quantity of opposing limbs. So it is, however, that the Ayes have it in point of numbers by eight to three, and in point of quality the reasons for the Noes are decidedly weak. The first is the common Sabbatarian reason, which, as has been pointed out over and over again, amounts to saying that for Englishmen to look at pictures on Sunday would be a breach of a commandment given to Hebrews not to work on Saturday. The second is the Continental Sunday; to which the answer is that the differences between an English and a Continental Sunday do not depend on museums being open or shut, but on the general habits and manners of society. Of course the Continental Sunday is not the same everywhere. There are countries, the Netherlands for instance, where, while the public allowance of recreation strikes an even balance between the rigour of Scotland and the laxity of France, the amount of churchgoing can bear no comparison with either of these countries or with England. The third reason is that Sunday opening of museums "would involve a large amount of work on Sunday on the part of the custodians of those buildings, and it is unfair to demand such labour from some merely to give pleasure to others." Mr. Buxton has forgotten what must to a statesman be the strongest argument against present change—namely, that without entering into the abstract merits of the question, it is clear that such a change ought not to be adopted without the manifestation of a strong preponderance of popular feeling in its favour, involving the discussion of the details of arrangements which are not less worthy of careful consideration and adjustment than such a weighty matter as the fashion of rabbit-traps. We are very far from the possibility of any such investigation, and in the present divided state of public opinion the change can hardly be effected without grave risks of scandal, both moral and material.

Purists in the doctrine of self-government and political independence might possibly object to Mr. Buxton's array of ready-made arguments that it will save people the trouble of thinking for themselves. It appears to us at least as likely to put matter for thought into the heads of those who are accustomed to follow party cries without thinking. Partisans constantly neglect or actively conceal the fact that on most seriously debated questions there are serious and valid arguments on either side. And a work which exhibits this fact in a striking form, being at the same time and for that very reason a useful book of reference for party speakers and writers, is not to be despised as an instrument of political education.

SHELLEY'S PROSE WORKS.*

THE only fault we are disposed to find with Mr. Forman in his conduct of these important volumes is his treatment of Shelley's correspondence. Letters form a sort of *tertium quid;* they seem to be neither verse nor prose, and their place is properly found in illustrating the biography of the writer. But Mr. Forman has succumbed to several temptations in according to certain of Shelley's letters a place among his prose works. The Geneva correspondence, published in Shelley's lifetime, could hardly be

* *The Prose Works of Percy Bysshe Shelley.* Edited by Harry Buxton Forman. 4 vols. Reeves & Turner.

omitted in reprinting the *Six Weeks' Tour*; but there, we think, Mr. Forman should have stopped, unless indeed he was prepared to edit all existing letters of Shelley. As it is, he has gone too far and not far enough. He has so enlarged the section of correspondence given by Mrs. Shelley in 1840, that the sixty-eight letters printed in that year have increased to one hundred and twenty-seven; but he has left untouched the great mass of letters in Hogg's biography and those in the *Shelley Memorials*. It may be, though he does not say so, that difficulties of copyright stood in his way. We cannot, however, help thinking that he should have contented himself for the present with three instead of four volumes, and have waited until a complete collection of the letters, in volumes uniform with these, could be produced. Perhaps it would have been better still to have waited until all the letters could be incorporated into that authoritative life of the poet which yet remains unwritten.

In all other respects, however, these volumes seem to us to be as excellent as they are handsome; they certainly supply us with materials such as have hitherto been absolutely wanting for the realization of Shelley's early energy and ambition. It is, perhaps, not generally known that, besides the two wild romances called *Zastrozzi* and *St. Irvyne*, Shelley published no less than nine prose works, mainly pamphlets, before his poetical career had well begun. These little books, several of them anonymous, had become so excessively rare, that when Shelley began to be a theme for curious bibliography, scarcely any of them could be found. The Argus eyes of the collectors have at last searched all holes and corners to such purpose, that only one, the *Address to the People on the Death of the Princess Charlotte*, is still missing, and this, fortunately, has been restored from an early reprint. But, although the others exist, only unique copies are known of most of them, and some of these in private collections. Accordingly Mr. Forman's volumes reveal to the public pages written by one of the greatest of our poets which were previously as inaccessible as any treasures in the whole of our literature.

The positive value of these political and religious pamphlets is not very great, but they throw most important light on their author's biography. For instance, so much has been said and speculated about *The Necessity of Atheism*, that revolutionary *brochure* for the circulating rather than the writing of which Shelley was expelled from Oxford, that it is very interesting to be able at last to read it, and to decide for ourselves what were its actual inflammatory powers. The main import of all the anti-theological utterances in this and subsequent volumes may be summed up in the position that belief and unbelief are not moral but intellectual qualities of the mind, and that it is as vain to punish a man for not believing a certain dogma as to treat him as a criminal for having straight hair or being colour-blind. Many of Shelley's remarks in this connexion have lost their startling character, and are now commonplaces to all thinking minds. Others of course are still, and always will be, crude, violent, and needless. His political treatises are still less interesting, in themselves, than his religious ones, but they illustrate a very amusing episode in his career. Shelley, at the age of twenty, threw himself with the generous indiscretion of boyhood into the arms of the Irish Home-rulers of those days, and went off to Dublin, accompanied by his child-wife. Immediately on his arrival, he was fired with the design of "awakening in the minds of the Irish poor a knowledge of their real condition," which he actually carried out, with his accustomed fiery energy, by the composition of a fivepenny book, *An Address to the Irish People*, which went to press only one week after his arrival, he having spent that time in making himself "more accurately acquainted with the state of the public mind, on those great topics of grievances which induced me to select Ireland as a theatre, the widest and fairest, for the operations of the determined friend of religious and political freedom." Mr. D. F. MacCarthy has collected a mass of very curious information on the subject of this campaign of Shelley's, in the course of which the young poet astonished the Irish by his rapidity of public utterance, his nimble pen, and his quick assent to all demands upon his purse. He is, moreover, recorded to have written and published "a very beautiful poem," the proceeds of which, amounting to one hundred pounds, he presented to a Mr. Finnerty, a needy patriot; but one of the curiosities of Shelley bibliography is that this "beautiful poem," which sold so exceedingly well, is now not forthcoming.

It is natural that the reader's attention should first be drawn to those features of these volumes before us which present an absolute novelty; but he becomes gradually aware that, with the exception of a series of singularly eloquent notes on ancient sculpture, hitherto only published in excerpts, he already possessed all of Shelley's prose writing that has any claim to be called classical. The author of *Alastor* was even in 1815 so thoroughly a singer by temperament that he found it irksome to produce his ideas in any form but that natural to a poet—namely, verse. During the last five years of his life, years fertile in composition almost beyond parallel, he abandoned prose almost entirely as a vehicle for his ideas. It has often been said that Shelley was tending, at the time of his death, towards philosophy and politics, and that he would probably soon have ceased to write verse altogether. This is one of those rash statements, indulged in by loose theoretical thinkers, which will not bear the test of comparison with facts. On the contrary, it was in his adolescence, from 1810 to 1815, that his intellect was entirely absorbed by metaphysical reflections upon religion, social order, and politics. In *Queen Mab* the art of poetry is completely subordinated to this didactic tendency. With *Alastor*, in 1816, begins the practice of poetry, not for some ulterior end, but for its own sake, and from this point the merely doctrinaire side of Shelley's mind passes more and more from sight, existing always to the end, but kept in the background and not allowed to protrude officiously. At the moment of his drowning he had in hand three important poems, *The Zucca*, *The Triumph of Life*, and *Charles I.*, which are all three sufficiently preserved to show us that the poet was, so far from flagging in his ascent, at the very zenith of his powers and of his ardour as an artist, while the lyrics of the year 1822 are more perhaps than any others which he wrote, steeped in pure light and colour, and dedicated without reserve to personal sensation and experience.

We are bound therefore to consider Shelley's prose as the fragmentary and accidental expression of a nature that was still seeking a more natural and characteristic form of utterance. It belongs to the first youth of his mind, and is chiefly interesting to us because it contains the earliest exercises of his maturity. The extraordinary fertility of Shelley's brief life may easily blind us to the fact that he was not precocious as a poet. From early childhood he practised verse; but it was not until his twenty-fourth year that he began to display his peculiar gifts of language in poetry. The short pieces at the end of the volume of 1816 show him still faltering, though they sound the prelude of all the immortal music which was to follow. But a year earlier than this his prose was as supple, dignified, and harmonious as it was ever to be; and, in point of fact, became him at that moment, and for that moment only, much better than his verse.

The only important exception to the entire abandonment of prose in Shelley's later years is the *Defence of Poetry*, written in February 1821, in answer to an ingenious attack on modern verse by Peacock. This essay, moreover, is the only prose work which Shelley finished after his boyhood, the energy that led him so vividly to the close of his great poems seeming to turn into languor when the metre was not there to support it. The *Defence of Poetry* is a work which may be commended to all young writers of prose as a model, the more that its peculiar beauties are not those now in vogue among us. It may be broadly said that Shelley's prose was as ardent and as effusive as was possible in a generation that had not sat at the feet of De Quincey. In other words, it is the most highly-coloured and delicately adorned specimen of the prose of a generation whose main object in writing was neither ornament nor colour. In reading Shelley's periods we feel that we are still listening to a writer of the school of the eighteenth century; the difference is specific, and follows from the nature of the man, not generic and due to the temper of the age. Burke is the writer of whom Shelley's prose reminds us most; from Burke he learned the stately balance of phrases, the articulated sentences, which progress, each duly supported by its predecessor. To us who have been dazzled by De Quincey, electrified by Mr. Carlyle, smothered in rose-leaves by Mr. Ruskin, and debauched by the tasteless audacities of a thousand minor writers, the style which seemed too brilliant to Shelley's contemporaries, now may appear cold and subdued in its simplicity and grace. But we have but to submit ourselves to the charm to feel it, and above the dominant note of Burke's manner to catch the accents of a finer and more aerial nature. It is well to remind ourselves, by such passages as the following, every clause of which is worthy of close attention, that had Shelley written no poetry at all, he would still claim a high place in English literature as one of the most perfect of prose-writers.

> Poetry is indeed something divine. It is at once the centre and circumference of knowledge; it is that which comprehends all science, and that to which all science must be referred. It is at the same time the root and blossom of all other systems of thought; it is that from which all spring, and that which adorns all; and that which, if blighted, denies the fruit and the seed, and withholds from the barren world the nourishment and the succession of the scions of the tree of life. It is the perfect and consummate surface and bloom of all things; it is as the odour and colour of the rose to the texture of the elements which compose it, as the form and splendour of unfaded beauty to the secrets of anatomy and corruption. What were virtue, love, patriotism, friendship—what were the scenery of this beautiful universe which we inhabit, what were our consolations on this side of the grave—and what were our aspirations beyond it, if poetry did not ascend to bring light and fire from those eternal regions where the owl-winged faculty of calculation dare not ever soar?

It is not possible to do justice in a single article to the interesting matter redeemed from obscurity in these four volumes. We have scarcely space to refer to the "Notes on Sculptures in Rome and Florence," which Mr. Forman has had the good fortune to find in a MS. note-book, and to print for the first time in full. Shelley's feeling for sculpture was perhaps greater than that of any other English poet. His own works supply an inexhaustible range of subjects to be treated perhaps, in bronze or marble, by future sculptors. Few poets have had at the same time so delicate a sense of form and so great a fondness for lingering over images of arrested motion. It was therefore to be expected that he would prove a marvellous interpreter of ancient statuary, and we are not disappointed. These notes, sixty in number, contain some of the finest ideas which have been given to the world upon this subject, and when we consider the condition of criticism sixty years ago, when they were composed, are simply marvellous. They bear traces, both in feeling and expression, of Shelley's then recent study of Plato.

These volumes are uniform with the four volumes of the library edition of Shelley's poetical works, brought out three years ago by Mr. Forman, and are executed in the same admirable style. In

these days, when the production of books is left more and more in mechanical hands, it is only fair to note the appearance of a work in which the beauty of all the details seems to point to special care and forethought. The eight volumes of Shelley's works now completed form at last a suitable monument to one of the chief glories of our literature.

THE STORY OF STELLA PEEL.*

THIS volume does much more than introduce us to a new author and a new heroine. It makes us acquainted with The Literary Production Committee, or, at all events, with so much of The Literary Production Committee as consists of its Secretary, Mr. Charles Montague Clarke, LL.D. Whoever may be the literary people who form the Committee—from motives of modesty they would seem to keep their names concealed—they are certainly to be congratulated on the good fortune by which they have secured the services of so distinguished a Secretary. The formation of their Society is due to one of the most amiable of causes. "The trials and disappointments which are too often the lot of young and unknown authors on first entering the literary arena have been the primary cause of the formation of this Association." They have been moved, they tell us, by the neglect which encountered Charlotte Brontë, Carlyle, Moore, Thackeray, Bulwer, James, and Miss E. Braddon. The way in which these famous authors "were drifted about from publisher to publisher" excites their astonishment at the blindness of publishers. "We may say with Gray," they go on to write,

> "Full many a flower is born to blush unseen,
> And waste its sweetness on the desert air."

But these unhappy times have gone by for ever; for, in their own modest words,

> those who desire to enter the pleasing field of literature without encountering those stumbling-blocks to genius and progress—Neglect and Prejudice—will find in THE LITERARY PRODUCTION COMMITTEE
>
> A guide, philosopher, and friend.

The literary aspirant, as a rule, if we may trust the Committee, is very sensitive. "The harsh rebuff of an editor or publisher," we are told, "may quench for ever the spark of genius which needed only a little encouragement to fan it, may be, into a brilliant flame." If we might venture to suggest a slight verbal alteration to the Secretary, we would propose that in the next prospectus of his Society he should substitute in the sentence we have just quoted, *a little puffing* for *a little encouragement*. A moment's reflection will show him that thereby the metaphor will be better supported. For it is by a puff that a spark is raised into a flame. Though the primary cause of the Committee was, as we have seen, compassion, yet its objects, both principal and minor, to adopt its own classification, seem to wander somewhat far from the fields of pure benevolence. At all events, it requires in each case at least half a guinea before it can even begin to ascertain whether there is a spark that requires encouragement. Certainly to honorary members of the Committee it offers its assistance at a very low price. We might even say that it charges for it considerably less than nothing. By the annual subscription of one guinea the following advantages can be obtained:—

> 1st. All MSS. forwarded by members will be read, and advice and revision given free of charge. 2nd. Their contributions will have priority of consideration and publication. 3rd. A copy of every work published by the Committee will be forwarded gratis. 4th. All Stationery, Music, Books, Publications, &c., will be procured for members at cost price.

It is not easy, by the way, to see how genius is to receive its due reward if all the productions of The Literary Production Committee can be had by an annual subscription of one guinea. When we turn to their list of publications we find six books each at half-a-guinea. Then, too, we have six of Mrs. Charles Montague Clarke's novels at two shillings each, and some other works, whose united price amounts to no less than six shillings and sevenpence. It is as plain as Cocker can make it that by the payment of one guinea an honorary member can at the present moment make a clear gain of three pounds and sevenpence. All the other advantages—advice, revision, priority of consideration and publication—are thrown into the bargain. We are reminded of those members of the medical profession who merely charge for their medicines and give their advice gratis. We have as yet only laid before our readers the principal objects of this benevolent Committee. In their minor objects they wander somewhat far from their primary cause. For it certainly is not easy to see the connexion between the trials and disappointments of the young authors and the Committee's offer to insert advertisements in newspapers at cost price. In their first minor object they might, perhaps, do something to encourage the over-sensitive literary aspirants, for they are willing "to supply on short notice, at a small charge, original verses on any subject—valentines, birthday odes, &c.; also to write to order descriptive articles, essays, &c." They must therefore, we imagine, keep a large staff of authors, for it is hardly to be expected that the Secretary, though he is an LL.D. and the author of "an exhaustive treatise on corns and bunions," can, besides attending to the important duties of his office, be at the same time the original poet and essayist of the Association. Nevertheless, the smallness of the charge to the purchaser cannot but be somewhat damping to the spark of genius which on the previous page had been encouraged by learning that 6,000*l.* was paid for *Lothair*, and 12,000*l.* for *Our Mutual Friend*.

Dr. Clarke, we notice, is writing a work which might, we should fear, greatly mar the success of the Committee of which he is the Secretary. For the modest price of half-a-crown he is bringing out a "Complete Guide to Literary Success." "This book," he tells us with an assurance that is perhaps justifiable in the author of the exhaustive treatise on corns and bunions—"this book will embody in a plain and practical form an amount of information and illustration such as has never before been condensed in one volume—it will be, in short, a perfect Grammar of Composition and Guide to Authorship." It is a pity, by the way, that this Grammar of Composition was not written a year or two earlier. In that case, Dr. Clarke in his capacity of author might have been of some service to Dr. Clarke in his capacity of Secretary. Certainly, the prospectus of The Literary Production Committee might have been improved by the careful study of even an imperfect Grammar of Composition. The following sentence, for instance, even though it should pass unnoticed in the author of a treatise on corns and bunions, is scarcely up to the high standard of the perfect grammarian:—

> The objection of publishers to recognize works by unknown authors is not necessarily caused by any deficiency of merit in them, but by their ignorance of the existence of merit owing to the non-perusal of the works submitted; whilst in consequence of a prejudice in favour of well-known names few publishers now employ a reader on their staff; and, when they do, only submit to him a small portion of the MSS. forwarded to them, which he, after hastily perusing, rejects or accepts, too often most arbitrarily.

But, to return to Dr. Clarke's "Complete Guide to Literary Success." Why, we may well ask, when such a work is to be had for half-a-crown, should any one think of becoming an honorary member of the Literary Association at the cost of a whole guinea? What more is needed by the literary aspirant than literary success? Whether the Secretary acts quite fairly towards his Committee in thus under-bidding it, we must leave it to his own conscience to settle. Against the consequences of his revolt he is doubtless secured. A nameless Committee is not often found to act in opposition to its own secretary. He can generally manage to command a majority of one.

We must not linger so long over The Literary Production Committee as to leave ourselves neither space nor time for considering its product. *The Story of Stella Peel*, however, is not of so remarkable a character as to require any minute criticism. It forms the first number of The Boudoir Library, and, for all that we can see, it may be as well read in a boudoir as anywhere else. It is a little tedious, but boudoirs usually have a sofa and an easychair, so that the reader will not be without the means of enjoying a peaceful slumber should drowsiness overcome her. Stella Peel—whose real name, by the way, is Mary Pitts—had run away from home, because her stepfather would not allow her to become an actress. He was a village schoolmaster, and he was resolved that she should become a teacher or go into service. She escaped both positions by taking the train to London. There she in time acquired great fame as a reciter, and married the son of a nobleman. Her lot was not a happy one. In the first place, her husband had an overhanging upper jaw and a receding chin, which showed that he was not only weak, but that his weakness was of that sort which leads to selfishness and cruelty. In the second place, she had not the satisfaction of knowing, till close on her death and the end of the story, who her husband really was. Her fate is mixed up with that of a lady who is almost as much an heroine as herself. At all events, she survives to the very last page and marries the good hero. About the middle of the story we find the two heroines "both drifting on a sea of perplexities, the constituent elements of which were identical." One of the constituent elements of this remarkable sea was, as we have shown, the wicked heir to the nobleman. The other was a poet of a melancholy temperament, who had not been able to find a publisher. We are surprised, by the way, to find that Dr. Clarke has not added a footnote to remind the reader that at the date of the story The Literary Production Committee was not in existence. The poet becomes acquainted with Stella and prevails on her to become what is called the interpreter of his poems to the public. Meanwhile, ignorant of the fact that she is already married, and forgetful moreover of the fact that he is already in love with the other heroine, he at once falls in love with her. She, however, as well became a young woman who could repeat, as the reader had been told, her Church Catechism, kept clear of falling in love with him. However, the rival heroine becomes very jealous, and for a long time the second pair of lovers are estranged from each other. It soon becomes evident to the experienced reader that Stella is doomed to an early death, but before long he begins to be anxious about Flora also. One day in winter she takes a walk by a pool, hears "a whistling wail of wind," and notices that "even the swans seemed moping and depressed." The poet, moreover, for a time despises county balls and fox-hunting, and cannot, we read, find any permanent distraction in mere amusement. We can well believe that, about this part of her story, the author was half inclined to indulge in the luxury of the most tragical conclusion. Perhaps, for all we know, she may have even gone so far as to kill off all the lovers, and have then paid her half-guinea to The Literary Production Committee for the improvement of her MS. "by revision, condensation, expansion, or reconstruction." Some Committeeman, of a more cheerful turn of

* *The Story of Stella Peel.* By Harriet L. Childe-Pemberton. London: Published by the Literary Production Committee.

mind, may have condensed the story by cutting out two death-beds and substituting for them one marriage. Be this as it may, the story has as happy an ending as can be expected or even hoped for. The reader in her boudoir will have her sentimentality gently roused by the heroine's early death, her delight of reading about lovers gratified by the reconciliation of Flora and her poet, and her sense of propriety satisfied by finding that the wicked son of the nobleman makes some approach to repentance, and is to have for his second wife a lady who has a fortune of one hundred thousand pounds.

NICHOL'S BYRON.*

FROM some points of view it might be said that Professor Nichol has had allotted to him the hardest of all the tasks with the distribution of which Mr. Morley is charged in the series of "English Men of Letters." It is not that original research into facts is required, for by this time, unless Lord Broughton's famous papers prove unexpectedly fruitful in the next century, we probably know all about Byron's life that we ever shall know. Nor is it that the last word has been said about the author of *Childe Harold* in the matter of criticism. The difficulty of the task lies rather in the necessity (if it is to be performed according to the rules laid down in the programme of the series) of recording, in a small compass, the events of a very eventful and a much discussed life; and, at the same time, of giving a critical estimate of a very large body of work concerning which doctors disagree, more than concerning any other such work, and in respect to which nothing like a general assent, even of lay-readers, is likely to be attained. Through these difficulties Professor Nichol has made his way with a good deal of courage and not without a good deal of success. His narrative is about the best we have seen on the subject in any reasonable compass. His criticism seems to us inferior, not so much because we do not agree with its decisions, as because those decisions do not seem to us to be full enough, clear enough, or sufficiently co-ordinated into a harmonious view of Byron's singular genius.

The author begins with an elaborate account of the poet's ancestry, dwelling with delight on sea-king Buruns and Birons, and on "a certain shadowy Marshal de Burun, famous for the almost absolute power he wielded in the infant realm of Russia." It is odd that he does not notice the singular coincidence of the existence of the Biren or Biron, favourite of Anna Ivanovna, who is not shadowy at all, and who certainly for a time wielded almost absolute power in the adolescence of the Russian realm. These genealogies are not introduced for nothing, for it is part of Professor Nichol's plan to lay great stress on Byron's aristocratic descent, and at the same time on the bad blood he inherited. The youth of the poet and his mother's fatal mismanagement of him receive due consideration, and so do his years at Harrow and Cambridge. Professor Nichol is very severe on Miss Chaworth for having "no intuition to divine the presence of one of England's master minds" and for preferring her "hale, commonplace, fox-hunting squire." Now in reality Musters was by no means a commonplace person, being much more like Byron's ideal of the all-prevailing seducer and destroyer than Byron himself, though he was no doubt immensely the latter's inferior intellectually. Shortly afterwards Professor Nichol's defence of the influence of Universities as producers of English men of letters is one of the very best things in his book, being not only absolutely in accordance with history, but positively needful in order to overthrow persistent misrepresentation on the part of tailless foxes. The sketches of Byron's early friends are also very good. The unparalleled folly with which the poet paraded and exaggerated the sins of his youth is justly denounced; but Professor Nichol might have found a happier phrase of denunciation than the description of this folly as being "in a manner which even Théophile Gautier might have thought indelicate." We are not aware of a single passage in Gautier's voluminous works where the least symptom of personal indiscretion or *fanfaronnade de vice* is discoverable. In the same context, however, is a remark, which we very heartily endorse, to the effect that "the moral worshippers of Goethe and Burns, who hiss at Byron's name," would do well to attend to certain differences between the gallantries of the three. The chapter devoted to the two first years of Byron's travels is excellent, though we wish we knew what Professor Nichol means by attributing to Englishmen generally, and Byron in particular, a "share in the *émigré* spirit." The connexion between Byron and Coblentz is not obvious. Nor is it very clear to us what force there is in the remark that the Elgin Marbles are preserved "like ginger" in the British Museum. We have certainly heard of preserved ginger and of *Venice Preserved*, and of several other things, but the analogy to the Elgin Marbles does not make itself plain. The next chapter handles Byron's life during his first stay in London, and contains the best piece of criticism in the book concerning *Childe Harold* and the other romances of the *Corsair* period. Then we come to the marriage, the separation, the second journey abroad, the debasing sojourn at Venice, the comparative reclamation by La Guiccioli, and, lastly, the Greek expedition and its close. All these subjects, some of them very thorny ones, Professor Nichol handles with a judicious mixture of communicativeness and reserve. He is, on the whole, very lenient to Byron, disbelieving the worst charges against him, and palliating others. With regard to the intellectual work of this time, he is positively enthusiastic, though his enthusiasm is not altogether undiscriminating. For *Cain* and *Don Juan* in particular he can hardly find words to express his admiration. But the reader will find all the necessary facts set down here, and nothing extenuated in any dishonest sense of that word. In respect to Lady Byron, indeed, the biographer is studiously moderate. He has resisted or has not felt the peculiar feeling of repulsion which the idiosyncrasy of character produces on some people. The kind of evil eye which Lady Byron exercised on every one drawn into her circle has perhaps only lately been fully made known by the publication of Mrs. Jamieson's Memoirs.

If we consider Professor Nichol's verdict on Byron's personality too lenient as a whole, it is not because we think worse than he does of his hero's moral delinquencies, but that we think those delinquencies were aggravated by a quality in which Professor Nichol seems to see something of an excuse. This is what we can only call, though we do it with reluctance, the snobbishness of the poet's character. His biographer treats such things as his ineffable request that Lord Delawarr should be spared fagging, "because he is a brother peer"; his welcome of the brother men of letters who stooped to assume the "noble author" attitude to him, and his wrath at those who refused to assume this attitude; his childish ostentation in dress, in boasting of his ancestry, in claiming precedence of the English Ambassador, and all the rest of it as a pardonable eccentricity, not as a definite and very ugly disease. One really is sometimes tempted to think that there must have been a bar sinister somewhere else in the tree than in the place where it usually appears, and that Byron was not a Byron after all, for nothing can be more different than his family pride and that of such typical figures as the famous "Proud Duke" of Somerset. It was uneasy, touchy, most sensitive in little things, and altogether rather the pride of a De Mogyns or a FitzSnooks than the pride of a bearer of one of the best names in England. We hardly know a more disquieting case for the implicit believers in the maxim *Bon sang ne peut mentir*. For the reply that Byron's blood was not good blood, but very bad blood, will not help them at all, because the badness of the blood in question was of a different sort. The conduct of his father in running away with Lady Caermarthen, of his predecessor in the title when he committed murder with the boast, "I have as much courage as any man in England," was bad enough, but it was in each case the conduct of a bad, but manly, man. Byron's own conduct in not a few cases bore a much greater resemblance to the conduct of what was originally an antonym to "man"; the conduct of that singular class of human beings whom the greatest humourist of our century has gibbeted, sometimes fairly, sometimes unfairly, but certainly for all time as far as the English language is concerned.

It is unpleasant to have to urge this charge against one who was in many ways so great as Byron; but it is so intimately connected with his literary characteristics and shortcomings that a literary critic should never pass it over. It is, we are pretty sure, because Professor Nichol has passed it over, or has at any rate made light of it, that his literary estimate of Byron is incomplete and unsatisfactory. In the first place, he pays, as it seems to us, a great deal too much attention to the remarks of foreign critics on Byron, remarks vitiated at the fount by the fact that the peculiarity alluded to has never struck any one of them. All that the admiration of Goethe, Chasles—by the way, why does Professor Nichol decorate that modest Mazarinæan with a "de" which he certainly never assumed—Castelar, and Elze proves is that the matter of Byron's work coincided in a surprising degree with the current thought of Continental Europe at the time and for long afterwards. It did so beyond all question, and such greatness as this may entitle the poet to is as unquestionably his. But an English poet must be judged first of all in reference to English poetry, and his weaknesses as well as his merits in this connexion must be clearly set forth. This is what Professor Nichol has failed to do. He hints rather than points at the hopelessly uncritical condition of Byron's mind, the condition which, according to the mood he was in, made him dismiss Keats as a drivelling idiot or pay him clumsy and inappropriate compliments. He does not lay much, if any, stress on the fact that, notwithstanding Byron's habit of correcting with care what he had written with haste, no poet even of the second order in English literature has left more bad English, more bad verse, more loose and bodiless improvisation, more repetition of himself, more mawkish twaddle. He admits indeed that Byron could do nothing with lyrics—a great point against him, for the poet who cannot if only now and then, and at a pinch, write in the simplest and highest form of verse, hardly deserves the name of poet. But he does not notice that even Byron's best passages will not stand critical examination. They excite rather than transport, and when the reader examines seriously what he has felt, the impression of a vague contagious excitement is all that he retains. The best poetry—all good poetry in fact, whether it be Shakspeare's, or Shelley's, or Spenser's, or Heine's, than which four styles we can hardly conceive any four things more different—has an effect quite independent of the exact thought which it contains, and the beauty of the poetry as poetry goes on supplying a perpetual linked sweetness of suggestion. In reading Byron, on the contrary, the reader dimly feels that he is in the presence of a very eloquent person who is, or would like to be thought, in a state of great excitement about something, and that it is his duty to become excited too. Had

* *Byron.* By John Nichol. London: Macmillan & Co. 1880.

Adam Smith lived, he might have added to his Theory of the Moral Sentiments a most interesting chapter, illustrating the contagion of sympathy from the popularity of Byron. Now this contagion of sympathy survives the difference of language, and hence foreign critics admire Byron while they look at our English exaltation of Keats and Shelley as a deliberate piece of unintelligible will-worship. It may be quite true, as Professor Nichol says, that if 1820-1840 was a period of exaggerated Byron admiration, 1840-1870 was a period of exaggerated depreciation of Byron. But if, as he seems to think, the author of *Childe Harold* is not merely deserving of rehabilitation but in process of receiving it, there is all the more need for very clear critical guidance to direct the repentant and returning worshippers. Those who set themselves to work to adore what they have burnt are apt to go to rather unreasonable lengths in the adoration. No one has the slightest right to be listened to as a critic who denies Byron a high place on our Parnassus. But at the same time it has to be shown that this high place is not only not the highest, but is a long way from the top. It seems to us not merely that Professor Nichol has failed to make this needful demonstration, but also that he has failed to indicate the poet's place, even according to his own notion, at all clearly; and for this reason we cannot assign to the critical part of his book the value which undoubtedly belongs to the biographical part as a clear, full, and interesting narrative.

THE ANTIQUARY.*

As every county has now an archæological body whose transactions are duly printed, and there also exist several more broadly constituted Societies who pour their streams of archæological intelligence over the country at large, there might seem to be hardly need of another periodical "devoted to the study of the past." In the change, however, which a few years ago came over the *Gentleman's Magazine* some elements of interest were excluded that have since been missed by certain classes of inquirers. In fact, popular archæology, as unrepresented by the Societies, was then rendered homeless. Perhaps this has been a case of no widely-felt distress. Popular archæology may be shortly defined as pleasant excursions to picturesque old buildings; and, for the most part, the numerous bands of summer antiquaries who rove in confused march from desolated feudal castles to restored cathedrals, are not careful to crowd their memories either before or after their visits with all the details in the history of the objects viewed, being satisfied with the explanations of their leaders on the spot. The several attempts, however, which have been made to establish a serial more or less of the former antiquarian complexion of the *Gentleman's Magazine* shows a belief on the part of the promoters that there is a public waiting for further information on the works and days of old. Two at least of these ventures have proved failures. *Long Ago* published its seventeenth and final monthly number in May 1874. It was well printed and with such satisfactory papers as the Rev. Baring-Gould's "Mythology of the Rainbow," and Mr. Llewellyn Jewitt's illustrated articles on "English Modes of Burial," as typical contributions, it should not have been willingly let die. The *Antiquary*, which anticipated in its title the volume we propose to consider, appeared in weekly numbers during four years, coming to an end also in 1874. Except in the external form, which might have satisfied Jonathan Oldbuck or T. F. Dibdin, we do not see that the later *Antiquary* shows any important characteristics not to be found in its extinct predecessors. In the earlier *Antiquary*, the articles were in general so short and fragmentary that we were reminded of Colton's *Lacon* or Mrs. Glasse's *Cookery*. In its successor of the same name, if the papers are not always on too miniature a scale for the adequate treatment of their subjects, they are too frequently of an accidental or frivolous kind, being apparently the voluntary offerings of *dilettante* or amateur writers, whose maiden meditations on their favourite fancies have here for the first time arrived to the dignity of print. We look, so far in vain, for such solid papers as Mr. Blight's on "Cornish Churches," or the anonymous series of articles on the "Ancient Architecture of Ireland," that appeared with admirable woodcuts in the later volumes of the old series of Sylvanus Urban. Instead, we find more than one superficial article in recommendation of the sorry practice of making collections of book-plates, a process hardly less puerile than gathering postage-stamps. The original insertion of the book-plate proves that it was intended to be inseparable from the book, and immeasurably more interest frequently attaches to a particular copy of a work by the evidence the plate affords of its former ownership. Every lover of books can point to volumes in his library that are endeared to him not only for their own sake, but for the sake of some one to whom a label or autograph attests that they formerly belonged. The gathering of books for the sake of the armorial or other plates within their covers is an intelligible pursuit—the interest of the plate is communicated to the book, and of the book to the plate. But the gatherer of book-plates dismembered from books has his poor reward in the possession of a hundred coats of arms from as many volumes, that he might with more readiness and less mischief have brought together from the armorial plates of a "Peerage" or "Landed Gentry," of the engravings in which works the book-plates are chiefly a reproduction. It is true all book plates are not heraldic. Like tombstones whose holy texts teach the rustic moralist to die, within book-covers may sometimes be found admonitions that might be taken to heart by the polished seeker of wisdom from books not their own. These apophthegms are not always selected from Holy Writ, but we have a copy of Paley's *Gothic Architecture* in which the name and address of the pious Mary Anne Schimmelpenninck having been given, we find a verse from Psalm xxxvii., "The wicked borroweth and payeth not again"; a sentence which makes us hasten to affirm that we bought and did not borrow the book. We fear, however, that the adoption of even Mrs. Schimmelpenninck's telling verse of Scripture would prove hardly of more efficacy than the tragical formula so much in favour with schoolboys—"Steal not this book my honest friend, for fear the gallows be your end."

Of more practical value than the contributions we have just mentioned are two papers by Mr. E. P. Loftus Brock, F.S.A., containing his views on church restoration, the true principles of which, he says, are contained in the golden rule, "Repair only," "attention to which would have saved many a priceless building." But even repair has its dangers. "As the clear light on the holy candlestick so is the beauty of the face in ripe age." So also is the incommunicable charm of antiquity which Mr. Brock complains is often effaced from an old building by the ruthless process of "combing down," a style of renovation that is generally classed under the name of repair. The writer illustrates his remarks by anecdotes of his personal experiences as an architect, which contain profitable lessons for less cautious brothers in his profession. Mr. Brock's opinion that "it may be doubted if any other class of men possess generally so much feeling of reverence not only for God's Holy Temple, but for antiquity as architects," ought to excite a generous spirit of emulation in the clergy who administer in that temple.

The Rev. Dr. Hayman's three papers on the "Historical Memories of Tewkesbury Abbey," are, if we perhaps except a short article by the Rev. G. C. Swayne on the "Value and Charm of Antiquarian Study," as literary compositions the most enjoyable in the volume. Thomas Fuller has said in his usual manner, that though arguments are the pillars of a discourse, similes and metaphors are the windows which let in the light. We cannot say so much for Dr. Hayman's figurative elucidations, which are at the least cloudy. His papers are less a history of the abbey than slight biographies of its baronial founders, who raised a structure worthy of their powerful names. By incorporating the political careers of these men in the memories of the abbey Dr. Hayman tells us that "he shall endeavour to show that this church, down to the end of the fifteenth century touches English history at all its greatest epochs." This is intelligible; but he immediately adds: "It is the *locus* of the point of interest all along," by which we understand that Tewkesbury Abbey not only "touched English history" in the line of its greatest events, but was itself the radiating point of interest in those events, which is absurd. The cardinal battle of the field by Tewkesbury (4th May, 1471) would have been fought whether or not there had been an abbey in the neighbourhood to which the defeated lords might fly for sanctuary, and this is the signal episode that gives character to the place. Dr. Hayman further says that the same Church "represents all the greatest influences in our social development; it directly embodies in its memories both the Crown when the Crown was a *primum mobile* in politics, and all the estates of the realm. It shows the Church as the keystone in which the contending masses met and balanced each other." When we remember the feuds between Anselm and William Rufus, Henry II. and Thomas Becket, Stephen Langton and John, we fail to see how the Church was the centre of equilibrium when the Crown was the *primum mobile*. Instead of being the keystone against which the contending estates of the realm fell into the compact and graceful repose of an arch, there was no point of time from the days of Odo to the Reformation in which the Church had not to strive against secular jealousies and factions. In the gradual limitation of her prerogatives by the withdrawal of the offices of military and civil jurisdiction from her spiritual leaders, by the exclusion of the clergy from the House of Commons, by the dissolution of the monasteries and the breaking up of the occupations of their inmates into all our learned professions, the Church has been all along like a field of beaten corn; and the Liberation Society informs us that her scientific frontier is not even yet settled. How the fierce splendour of the throne reflected from the royal alliances of the abbey founders beats through the pictured windows and gilds the monumental shrines of De Clares and Spencers is spiritedly told; but even here we find a grotesque figure of speech. "Tap the stream of our annals," says the writer, "where you will during those four centuries, and at every greater epoch you find a Lord of Tewkesbury, under some loftier title of honour, prominent in the crises. Thus the second founder, Fitz Hamon, nephew by marriage of the Conqueror, was of the dragon's seed of the Conquest, and represents its ideas." An outrush of high-titled lords from sluices in a stream suggests, according to the similitude used, an immersion as profound as that of perjured Clarence in malmsey, whose burial vault Dr. Hayman describes; and they would need indeed to have the vitality of the dragon's seed of Cadmus to spring to the dignity of the armed men whom we are supposed to behold on *tapping* the stream. Of course the writer has not forgotten the impressive incident after the battle, when the abbot (Strensham), bearing in his hand the consecrated host, charged the victorious king not to continue the bloodshed within the holy walls, whither many of the defeated combatants had fled. Upon the massacre being stayed, "monks, abbot, soldiers, knights, and king all formed in

* *The Antiquary: a Magazine devoted to the Study of the Past.* Edited by Edward Walford, M.A. Vol. I. London: Elliot Stock. 1880.

procession and went through the church and the quire to the hy awtere with grete devotion, praysenge God, and yeldynge unto hym conveniente lawde." More happily than in some of his instances, Dr. Hayman, in commenting upon this powerful scene, remarks that "since Theodosius was turned back by Ambrose from the gates of Milan Cathedral more than a thousand years before, there is no more impressive episode in Church history, nor one which more closely illustrates the beliefs and customs of the age."

When a sufficient account of the ancient monastic foundations of the country comes to be written, the Rev. Precentor Walcott's three papers, "Notes on some Northern Minsters," may, with the ground plans, be found useful to the historian of the subject. That there is not already such a scholarly history, notwithstanding the ready aid afforded for the work by the vast compilations of original records in Dugdale and Tanner, is as surprising as the general ignorance as to the character of the monastic system. That every monk was a priest is no more true than that every priest was a monk; but many liberally educated people would be found to believe, if questioned, that the taking of vows involved the taking of priestly orders. Mr. Walcott shows how the bareness of mere archæological statement may be sometimes relieved by literary references. The editor of the next edition of *Rokeby* may judiciously derive a note from the interesting mention of the Præmonstratensian Abbey of Athelstan or Eggleston (near Barnard Castle), through whose "Gothic arch" Bertram Risingham is represented by the poet to dash among the startled worshippers. The three rapid bounds with which "the noble courser" clears the "central nave" and "chancel wide" are declared to have been impossible. "The 'central nave' is aisle-less, and its very low doorways could never have admitted a horseman and his steed." Hardly more authentic than the spirited leaps of Risingham's courser was, if we may believe Mr. T. Morgan Owen, the triumphal procession of King Edgar on the Dee, with eight tributary kings for his oarsmen, which has been received with as unquestioning faith as Queen Elizabeth's visit with her sparkling cavalcade to St. Paul's to solemnize the defeat of the Armada. Mr. Owen starts up for the honour of his royal countrymen, and reasonably asks who were these kings that cowardly deserted their subjects to become oarsmen to an alien prince? That the early chroniclers differ as to the names of the royal boatmen, and that the Saxon chronicle does not mention the triumphant procession by water, is hardly increased in significance by the writer immediately adding, "nor does Humphrey Lloyd, in his *Historie of Cambria*, allude to this matter."

Both for its subject and manner of treatment we ought perhaps to touch upon the article by Mr. Edmund Waterton, F.S.A., on "The Imitation of Christ, by Thomas à Kempis." The title of the paper assumes the authorship of the *De Imitatione* to be irreversibly settled. "The rights of Thomas à Kempis," says the writer, "to the authorship are incontestable, and as clear as the rays of the sun at noontide. They have been clearly and irrefutably proved by the late Mgr. Malou, Bishop of Bruges, whose literary reputation is European." Mr. Waterton does not go over the proof, and his article perhaps is not the less interesting for the omission. Like the Bible itself, the division of the "Imitation" into verses or sentences is not original, and would not have been effected had it been noticed that the work in its primary form was metrically composed and indicated "pauses of greater or shorter duration to be observed in reading." This fact has been recently established by Dr. Hirsch by means of the Antwerp Codex (1441), and sufficient instances of the rhythmical arrangement are given by Mr. Waterton, whose short paper should be read in connexion with an article on the subject in the April number of the *Dublin Review*. Much of the literary and even spiritual charm of the book consists in its rhythmical construction. It was originally written for the use of the Brothers of Common Life, in the Low Countries, who were not bound by solemn vows, though obliged to practice obedience, poverty, and self-subjection. This accounts both for its monastic character and for the overflow of sublimated feeling that could afford consolation to such seemingly widely-asunder spirits as Comte and John Wesley, the latter of whom published an edition of the book.

"We are the gleaners after time," is the four times iterated refrain to some melodious verses prefixed to the *Antiquary*. The numerous cuttings from the *Athenæum* and the current newspapers give rather a literal interpretation to this honest confession. We cannot but think that these extracts, together with the notices of the meetings of learned Societies, might with advantage be separately paged, and added or omitted according to individual taste at the end of the volume. As they stand appended to each number, to the extent of a dozen pages together of small print, they offend the eye, and impart a more ephemeral appearance to the work than is perhaps needful. The genealogist has yet to wait for a periodical that will afford him a system of biographical and obituary notices, such as was contained during a course of one hundred and forty years in the *Gentleman's Magazine*. These were interesting and valuable, and are the only general source of reference of their kind for that period, and not beyond. In conclusion, we unfeignedly wish prosperity to the *Antiquary*; but its success must not depend solely, or even chiefly, on beauty of paper and typography.

TREES AND TREE PLANTING.*

MR. ABLETT'S work on *English Trees and Tree Planting* is a volume out of which may be gleaned much and curious arboricultural information for which landowners and farmers not specially literary or exact may be the better. At the same time it can hardly be said to surpass *Brown's Forester*, Prideaux Selby's *British Forest Trees*, or a more concise, succinct, and yet more exhaustive work than either, Mr. John Grigor's *Arboriculture*. Mr. Ablett has some interesting facts to tell as to the "eucalyptus globulus," and, amongst other things, as to the changing of barren sea tracts into thriving plantations of pineaster; but it must be confessed that the bulk of this information has been furnished long ago by Grigor, and that special details, such as the aptitude of sallows and willows and alders to fix the banks of watercourses, and to prevent the edges of river banks being washed away by sudden floods, are better and more practically given by Mr. Holt Beever in some of his experiences of Herefordshire farming on the banks of the Wye.

Mr. Ablett enters *in medias res*, when he divides English trees and tree-planting into (1) cone-bearing or resinous trees; (2) soft-wooded fast-growing trees; (3) broad-leaved timber trees; (4) trees and shrubs for arboricultural decoration. Under the head "Coniferæ" he classes "pinus and abies," and ten subsidiary genera, all evergreen save the larch and the ginko (not "gingo," p. 71). Of the *Pinus sylvestris*, the spruce, and the larch, the native and favourite soil is high and dry, and slow-growing. In fact, the researches of such grand planters as Lord Haddington 120 years ago, as well as of travellers and planters generally in the Highlands, Sweden, Norway and parts of Germany, Russia, and Poland, show that such timber is hardest, best, and reddest of colour in the coldest and most northerly situations, and that in richer soils and milder climates the seed degenerates. The researches of Mr. Don and Messrs. Grigor established clearly a deterioration of seed from cones of different qualities; the first or inferior, elongated, tapering, and with a rugged bark, but proportionately free-bearing; the second or better variety, thicker, smoother, less pointed, and hardier. Don conjectured that the greater part of the fir-woods of his day were of variety 1, the common and not horizontal variety; and the researches of the chief amateur planters in England and Scotland have abundantly established that successful Scotch fir-planting depends on procuring the true native seed of the mountains. As to the timber felling in the Swedish forests, with which the only region that can adequately compete is North America, Mr. Ablett cites several curious notes of travellers. A good account occurs in pp. 84-5 of M. Rupp's invention of the slide of Alpnach, as it was called in 1812, for launching pine timber down a vast trough, or inclined plane, from the top of Mont Pilatus to Lake Lucerne, nearly nine miles. Though wonderfully ingenious and effective, the speculation was abandoned when the markets of the Baltic were opened. The produce of the Scotch pine-wood plantations is shown to be proportionately valuable in all its stages, and minute directions are given for obtaining and manipulating, pulverizing, and cultivating the seed, which should be sown about mid April in England, and in the first week of May in Scotland. Of the Cluster Pine (*P. pinaster*), so called from its starlike form, we learn that it is indigenous to the Mediterranean, and Southern Europe, was introduced to England by Gerrard, at the end of the sixteenth century, and consists of many varieties. As may be gathered from its application to seaside tracts, it serves best for a deep dry sandy soil, and it is a most valuable tree to such localities, being of handsome, pyramidal form, and having clustering light green foliage. From its wide-spreading roots and the great depth to which they strike, it is rather an unsafe plant to move successfully, and two-year-old seedlings seldom take root when removed. Somewhat akin is the Corsican Pine (*P. Laricio*), a larger and handsomer tree of lower altitudes, and addicted to more average soils, introduced into England about the middle of the eighteenth century. One at Kew is nearly ninety feet high, but it is a white softish deal, not much used, and when used, more fit for packing cases than for joinery proper. The Austrian pine, a tree of robust growth and resinous timber, imported from Austria in 1835, reaches 100 feet in its own country. The Stone Pine, common to Southern Italy and Ravenna, is an ornamental tree in Italian landscape, a second-rate ornamental plant in England, best on a dry sand near the sea. In its own land it has edible and nutritious seeds.

Mr. Ablett's volume contains an account of the industry of "lumbering," a mode of procuring in gangs the timber of the white pine, which employs a vast number of British colonists in the United States. A "lumbering party" consists, we learn, of persons hired by a master man who finds pay, provisions, food, clothing, implements, and the like, on the consideration of receiving from the lumberers the timber brought down the rivers by them in the following summer. The camps, log-built and birch-bark-roofed, inhabited from midwinter till April, when the freshets come down, induce a reckless life, and the moral character of the lumberers is asserted to be generally undesirable, although so fascinating that even steady men from Prince Edward's Island are apt to leave the biggest wheat farms for the lucrative winter trade of lumbering. Among other coniferous trees Mr. Ablett describes the giant or Lambert's pine, from northern California,

* *English Trees and Tree Planting*. By W. H. Ablett. London: Smith Elder, & Co. 1880.

the Himalayan or Bhotan pine, the heavy-wooded *Pinus ponderosa*, and the pines of the Alps, Pyrenees, and other cold exposures, such as *Pinus sylvestris mugho*, *pumilio*, and *uncinata*—seldom more than mere bushy shrubs, of thick-set dark green foliage and hard wood. We should have been glad if Mr. Ablett had been able to point to the origin or derivation of the "mugho," which, however, he does no more than name. Of the spruce-firs—a genus of *coniferæ* differing from the pines in form and position of leaves—one of the commonest and tallest indigenous to Europe is the Norway spruce (*A. excelsa*), growing erect, conical in shape, and of luxuriant foliage to the very ground. It reaches 180 feet, and occurs in the *Hortus Kewensis* of Turner in the sixteenth century. For ornament and beauty it should have space and shelter, while for growth in plantations and for profit it is all the better for crowding, which results in its shedding its branches. The *Abies nigra* is the most durable American spruce, impervious to frost, and used in America as knees for shipbuilding. In this country it is most grown for ornament and rich dense foliage, as well as for its banyan-like tenacity of lateral branches, which depend, circle, and root anew round the parent tree.

The curious will find in the chapters concerning the silver firs and the rest of the coniferæ, accurate notes of soil, growth, habit, and cultivation. Perhaps among the coniferæ no tribe can rival the larch, the chief and almost sole deciduous tree of the tribe, as to which Mr. Ablett gives a well-considered summary of its cultivation, durability, casualties, and diseases. When we come to the genera and species of broad-leaved timber trees, and discuss the ancient historic oaks of England and the evergreens and sub-evergreens of the same great tribe, which so many writers, such as Selby, Gilpin, Grigor, Brown, and others have carefully commemorated, it is evident that a new aspirant to the praise of arboricultural research is nowhere, unless he is exact and accurate; yet where, except in the merest shifting of form and omission of essential facts, *e.g.* foliage and acorns, does Mr. Ablett's record of the Winfarthing oak, old at the Conquest, differ from Grigor's? Where Mr. Ablett says the Boddington oak in the Vale of Gloucester was 54 feet in circumference at the base in 1850, Prideaux Selby meets us with the statement that the remains of it were burnt down in 1790, a discrepancy *valde deflendum* to all lovers of accuracy. But not to multiply examples of unverified statement, of which we cannot acquit Mr. Ablett, in his account of the cork tree (*Quercus suber*) borrowed wholesale from Grigor and Loudon, whom he misprints *Loudan*, he has the temerity to hazard a reference to history. "During the siege of Rome by the Gauls (he tells us in p. 180), Camillus, who was sent to the Capitol through the Tiber, wore a life-preserver of cork beneath his dress. Curious, if true, is the natural remark." But we look in vain through Livy's *History of Rome*, Book V., and Plutarch's *Camillus*, for chapter and line. At last a keener search than Mr. Ablett can have deemed the question deserved discovered that, according to Livy, in the severest strait of Rome, it was determined to send for Camillus, an exile, from Ardea, and that for that object an active young man, Pontius Cominius, volunteered, and swam down the Tiber to the city, *incubans cortici*: "with the assistance of cork tree bark." Plutarch tells the same story, which might be found in the English of Andrew Thevet's translation of *Plutarch*, and which might have prevented our editor from making the slip. While yielding to none in claiming due honour to the elm whether English or wych as a forest tree of mark and pre-eminence, we regret to see it so cursorily or perfunctorily mentioned as in pp. 200-5. The first paragraph of p. 200 seems to imply that after attaining maturity at seventy or eighty years, the English elm is apt to become hollow in the centre, and "during heavy gales these affected trees are often blown down, making a gap in some stately avenue, perhaps leading to a country mansion, &c." We cannot agree that, except near stagnant water, elms are so liable to be blown down in other than exceptional gales or hurricanes, as in the calmest summer weather, when taxed beyond endurance by the overweening density of foliage. In the Midlands the English elm is as often known as Worcestershire as "Warwickshire"; and it would have been well had Mr. Ablett gone a little deeper into the distinct varieties of it. We ourselves a month or so ago beheld one of the most graceful of trees of the *Ulmus campestris* character of upright growth and shining, whitish leaves, ornamenting the lawn and terraces of Trerago, an old castellated mansion near Ross. It would have been better to give a few carefully-penned chapters containing the needful data as to the birch, the walnut, and the chestnuts, horse and Spanish, than to copy almost word for word from Grigor. As a rule, we have found Mr. Ablett's advice about plantations and planting with a view to shelter sound and sage, and the hints on transplanting grown timber on Sir H. Stewart's improved plan useful and practical. The author is worthy of heed, too, on the vexed question of hedges, though as to the Lombardy poplar, he fails, to our apprehension, in showing that a *Populus fastigiata*, grown for embellishment in this country, has not far greater beauty in a landscape than those acres of uniform flat and lopped fencing which form the sole hedgerows of the Continent. But we have one fault to find with this book—namely, its too free appropriation of recent and extant authorities, such as Griger, Brown, Grindon, and others.

JOHNSTON'S HISTORICAL ATLAS.*

It is somewhat singular that, notwithstanding the excellence of English cartography, we have hitherto in many ways lagged very far behind the Continent in the provision for the student of atlases, definitely intended to facilitate and accompany the study of history. Nothing even approaching Spruner in excellence has ever been put forth by any of our map publishers in respect of modern history; and, though the now numerous classical atlases published at different times are practically atlases of ancient history, few attempts to extend them to modern times have been made at all. The volumes before us are an attempt at an historical atlas, it should have been added—of English history—for, though foreign countries figure in the list of contents, the number of maps allotted to them is few compared with that given to the three kingdoms, and even those which are included deal rather with the foreign relations of England than with anything else. Incidentally, of course, a good deal of assistance is given to the student of general history, but primarily the book is a companion to the annals of England. Of the thirty-four maps which its first volume contains, seven are allotted to England at different times; five to Scotland, two to Ireland, three to France, eight to Europe; while maps of North America during the period of colonial dissatisfaction and revolt; of the world, showing geographical discoveries and British possessions; of our Indian Empire; of Russia, to illustrate the Crimean war; and of Turkey and the Turkish Empire, to illustrate that of 1877-8, complete the list.

The execution of the maps is, on the whole, what might be expected of publishers who have done so much for geography; but we do not know that their design and details can be quite so generally praised. To begin with; the *format*—a quarto of no great size—seems to us rather too small. This is not of much consequence in the earliest maps, where the comparatively scanty details of Roman Britain find room and verge enough for insertion. It may be observed, however, that the companion map of Roman Gaul is anything but lavish in the matter of insertions, that it is decidedly capricious as to inclusions and exclusions, and that the modern names are added or omitted with still greater caprice. It may be quite right to mark the site of Carnac as a monument existing in Roman times; but, if so, why omit the Pont du Gard? If Tolosa needs [Toulouse] in brackets, why is Augustodunum left unaccompanied by [Autun]? Something of the same objection may be made to the map of Saxon England, though that of Scotland is better. We cannot see the use of giving a single map of Europe "during the Norman and Plantagenet periods" because the changes in the course of the three or four hundred years covered by that phrase were necessarily so great and numerous that the student will be more puzzled than assisted by it. It would be a waste of time to point out all these changes, because every one acquainted with the subject is aware of them. It is sufficient to say that, according to this map, the unwary student (and how unwary average students are it is needless to say) will be under the impression that Normandy was constantly, and no other part of France at any time, under English rule between 1100 and 1400, that during the same period the Empire, the States of the Church, and Naples neatly trisected Italy between them, and that Spain unalterably consisted of a huge kingdom of Castille, a small Aragon, and a tiny Granada and Navarre. Some indeed of these very arrangements are shown differently in the next map, "Europe during the Crusades." Yet we are under the impression that the Crusades were wholly included in the "Norman and Plantagenet" period. In another map, that of France, illustrating the Hundred Years' War, there are some serious defects; the provinces are indeed marked, but then for this period, much more important minor districts, such as Rouergue, for instance, are very sparingly given, and the sites of events of great importance, such as Brignais, Cocherel, and Formigny, are also to seek. The maps which follow are open to less exception; but when we come to a map of Europe from 1660 to 1714, the same objection which was previously urged becomes applicable, as well as to that which professes, almost more hardily, to represent the same continent from 1714 to 1830. The truth is that to design a really good historical atlas is by no means an easy thing. The only way to do it is to seize the important dates, and give representations of the arrangement of countries at these, and this is what in this atlas seems to have been but little attended to. That it will be of use need not be said, for, except when it attempts the impossible, it is generally accurate, and its defects can be supplied without much difficulty. But it certainly might have been made much better by a slight extension of scale and a more careful choice of subjects. Thus, we do not know that three different maps are required for England since the accession of the Tudors, while, most assuredly, three are not required for Scotland. On the other hand, the maps of Europe might have been increased in number with great advantage, and this increase of number would have enabled them to be allotted each to a distinct and actual date and arrangement, and not to fallacious and unreal "periods."

The most obvious objection to the enlargement of the scale of the maps and the increase of their number is, of course, the corresponding increase of cost. But this might have been met very simply. At present the work consists of two volumes, of which

* *Historical Atlas.* 2 vols. W. & A. K. Johnston. Edinburgh and London. 1880.

we venture to think the second wholly superfluous and a mistake. It consists of historical notes to the first, or, in other words, of a sketch of the history and geography of England, Europe, and some other parts of the world, for a couple of thousand years. Such a thing is, in the first place, unnecessary, because an historical atlas is intended to be not a self-contained compendium of historical and geographical information, but a companion to regular and more or less elaborate historical works. In the second place, it is an impossibility in the space allotted. One hundred and thirty-seven pages, even if they be quarto pages, and tightly packed with letter-press, cannot possibly contain more than the barest outline of the facts represented by thirty-four maps of the history of England and Europe. Such a sketch, therefore, attempts to do more or less badly what is already well and sufficiently done by others which are in their proper sphere. Nor is this highly-compressed compendium of history free from some errors in its course from "Midacritus, a Phœnician, who is the first civilized man known to have had any dealings with Great Britain," and who had those dealings at some very indefinite period, down to the present Sultan, who "has accepted the English scheme of reform for Asia Minor." These last words show the folly of attempting such a sketch in such a book; a year probably has passed since the words were written, and the acceptance of the English scheme of reform for Asia Minor is a matter which is not even history. Errors of detail are perhaps unavoidable. Still, it would be well not to assume that the modern Autun is the ancient Bibracte, because the best authorities have come to the conclusion that it is not, Bibracte being now assigned to the much more likely situation of Mont Beuvray, at some little distance from the city. Nor is it correct to say that in the memorable uprising which so nearly overthrew Cæsar's divided forces, Sabinus (here carelessly printed Vabinus) had his camp surprised. The facts were that Sabinus was, according to a stratagem common with barbarians, lured from his camp and attacked on the march. To take a very different period, it is not correct to speak of the "great mountain chain of Corry-Arrick" as having been in possession of Charles Edward when Cope advanced. Corry-Arrick is not a mountain chain at all, but simply a pass with a hill of the same name on one side of it. These small inaccuracies, which are not surprising in a closely packed assemblage of facts, might probably be supplemented by a good many others. But their existence is not the ground of our objection to these historical notes; nor do we complain of the frequent awkwardnesses of style which are also noticeable. At the same time we must say that such a sentence as "the settlers, to the number of 146, were seized and imprisoned in a dungeon known as the Black Hole, 123 of whom perished in one night," can hardly be considered quite up to the mark. The point of objection is, as already stated, that the book aims at an impossibility. Universal histories in a small compass are generally a mistake; but a universal history in a small compass as a key to an atlas seems to be a mistake equally obvious and gratuitous. Among other difficulties which at once strike the reader is the difficulty of proportioning ancient and modern information. There is a natural tendency to enlarge the latter at the expense of the former. Thus we have here two entire pages out of the small number available occupied with tabular statements of the results of the Reform Bills of 1832 and 1867, things extremely useful in themselves, but certainly not worthy in such a book of occupying almost the same space that is given to the whole history of our Indian Empire. The same kind of criticism might be very much extended. Although, therefore, we have no doubt at all that these volumes will be very useful for reference, we think that a different plan would have made the work much more useful in itself, and useful to a much larger class. As it is, it may serve very well as a reference-book to keep on the shelves for those persons who like to be able to throw some light on historical or geographical allusions which they find in their ordinary reading. It also suggests itself as a very useful addition to the bookcase of primary schools, girls' schools, and other places of education where no very perfect scheme of instruction is aimed at, but where teachers of moderate cultivation often have to satisfy curiosity over a wide range of subjects. Even for these purposes we think that it would have been better if the historical notes had taken the form simply of a full and elaborate index of places against each of which, besides its whereabouts in the maps, might have been set a short notice (with dates) of the event or events which make it famous in history. But for the most valuable purpose of an historical atlas—the assistance of the actual student—very much more considerable changes would be required. We should suggest the abolition of the historical notes altogether, and the retention only of the maps and the purely geographical index, the maps being, if possible, doubled in size and the entries largely increased. There is no need to abandon the present plan of restricting their reference chiefly to English history and English relations with foreign Powers, because that we take to be of the essence of the book; and it is no part of a critic's duty to suggest to authors or publishers that they should attempt something entirely different from that which they have attempted. But it is a part of the critic's duty to point out how the actual attempt has come short of success, and that is what we have endeavoured to do. It is almost impossible to exaggerate the value of a good historical atlas as an assistance to the study of history, and something less expensive and elaborate than Spruner, and more strictly limited to the needs of the average English student, is very much wanted, and when supplied would be pretty certain of a good sale. The volumes before us—at least the first, for we own to regarding the second as a mere useless encumbrance—are a great deal better than nothing, and will be doubtless welcomed by a good many persons. Such an atlas as we have described, especially with a few plans of battle-fields, &c., squeezed into the corners, and with the dates given either in the plates themselves or on the margins, would be still more acceptable, and certainly more valuable. Any contrivance that is to assist the labour of many requires not a little thought on the part of the contriver, and in this historical atlas we do not think that the due proportion of thought has on the whole been given. To supply what is wanted, and not what is not wanted, is, it may be admitted, not an easy task for any caterer.

THE SHADOW OF A LIFE.*

A SUPERNATURALLY mysterious father, an equally unfathomable mother, and a lover who may best be described as a male flirt, are the personages who conspire to make Miss Ella Hamilton's life somewhat miserable to her; but, as it behoves every well-ordered novel of the present day to end well, happiness is the result of her three-volume misery. Thus far it may be said that Miss Beryl Hope's work is satisfactory, and, at the same time, she may be congratulated on the fact that her writing is tolerably correct and smooth. We wish it was in our power to say more of what has evidently cost the writer a great deal of trouble in composing. To say that this novel is beyond the pale of criticism is simply to acknowledge that the critic's art is limited to ordinary human experience, and that it is asking too much of a mortal when a judgment is demanded upon such extraordinary characters as those which appear in these volumes. Candidly confessing our inability, we will endeavour to sketch the main incidents that Miss Beryl Hope, in the character of Miss Ella Hamilton, a country doctor's daughter, has put together as making up the story of her life.

At the time when we are introduced to Mr. Hamilton he is a medical man in a very prosperous way of business, suffering from what is vulgarly called a chronic fit of the "blues." Some mysterious secret, as his daughter tells us, embitters his life. Naturally a cheerful girl, Miss Ella finds her home-life dull, confronted as she is by this melancholy father and his no less cheerless spouse, and it is not surprising that, after a scene of open rebellion against her governess, the young lady is packed off to school. From this she comes back, to find that matters are much in the same state as when she went away, and her discontent returns. One day, whilst sitting in her father's carriage at the door of one of his fashionable patients' houses, she is surprised with a request from the footman to go into the house. Here she is greeted by a Lady Constance Milford, the wife of a consumptive baronet, who treats her very kindly. This seems to her to be the turning-point of her life, for Miss Ella's ambition, it appears, is to visit and be on familiar terms with "the quality." When she informs her mysterious mother of the visit, however, she finds that it is not the most agreeable subject of conversation that she could have hit upon. And now we are further introduced to a certain family of Thorburns, who appear to be, much to Miss Ella's disgust, more to her mother's liking than the more aristocratic Milford family. By trade an ironmonger, Mr. Thorburn is certainly not of the most polished type; neither has his wealth—for he is wealthy—enabled him to educate his children particularly well. We are informed that Mr. Thorburn in the dark past had been very good to Mr. Hamilton, had even lent him money, and otherwise assisted him. The Thorburn girls are sharp enough to see Miss Ella's contempt for them, and consequently the visit is not of the most pleasing nature; in fact, had it not been that Miss Ella had just caught a glimpse of the hero of the novel buying a pair of spurs in the shop, we do not see why she should have paid it at all. On the next visit to the Milfords we are introduced to the hero, Captain Claude Douglas, and Miss Ella is much disconcerted at remembering where she had last seen him. To her great astonishment, shortly after this her mysterious father proposes that she should take a situation as a governess, by way of conquering her restless desire for society, and informs her that Lady Constance has heard of a place that would suit her. Naturally she resents this; and, being led to speculate upon her father's relations with Lady Constance, comes to the conclusion that it is all a plot to get her out of the way. Nevertheless, the Fates had so ordained; and, after having paid a visit to the family of the Douglases, where she was to be governess, she is witness to a scene that makes her hail the chance of leaving home with joy. The consumptive baronet has gone to his rest, and Ella and her father are spending the day at Milford. She, not in the best of tempers, walks out unseen upon the terrace, and, passing by the drawing-room, sees her father embracing Lady Constance. The secret is out, thinks this innocent young person, and rushes off to faint in the woods; but is kindly brought to her senses by a younger Mr. Milford, who accompanies her to the house. The situation is sufficiently disagreeable, it must be owned; and Ella, seeing it in all its hideousness, determines to be a governess, and, we suppose, let her impenetrable father go his ways. Much disturbed at what she had witnessed, she becomes the governess at the Douglases; but nevertheless allows her father, without any protest on her own part, to send her younger sister Mildred to live with the woman with whom she considers him to have a most abominable intrigue. In her

* *The Shadow of a Life.* By Beryl Hope. 3 vols. London: Allen & Co.

new situation she is made love to by Captain Douglas, who is Mrs. Douglas's brother-in-law. Indeed, from what we can see, every encouragement is given to the interesting couple by the mistress of the house, and she lives at Wentworth more as a guest than a governess.

The love-making proceeds in a way of its own, until, true to the old adage, and also to the exigencies of a three-volume novel, something occurs to upset its course. This something appears in the persons of Miss Ethel Blantyre, Mrs. Douglas's sister, and of an old housekeeper at Wentworth. The first time we come across Miss Blantyre is through the medium of a photographic album, where Ella sees a remarkably handsome girl, and is told accidentally that Captain Douglas was at one time engaged to the lady whose picture she was looking at. At an interesting point of the love episode Ella goes home to her father's house, where she learns that Mr. Thorburn, junior, a type of the genus cad, was an aspirant for her sister Agnes's hand. This is too much, and a violent scene ensues, estranging the two families. Shortly after this, Mrs. Hamilton is taken ill, and Ella is summoned in the middle of the night to her mother's room to find her lifeless. The cause of death, as it was found at the inquest, was an overdose of chloroform, and the jury, upon which was Mr. Thorburn, returned the extraordinary verdict "That the deceased died from the effects of an over-dose of chloroform; but whether it had been administered by accident or design there was not sufficient evidence to prove." Things look black indeed for the impenetrable father, who, to aggravate matters, now began to receive visits from Lady Constance at his own house. Upon Ella's return to Wentworth, she found Miss Blantyre in the flesh. In a very short time, Captain Douglas's conduct arouses suspicion in her mind, and the fiend of jealousy takes possession of her, as it appears afterwards, with good cause. This unfortunate lady is once more placed in the position of Peeping Tom of Coventry. Alone in a summer-house in the garden at Wentworth, she hears voices which she recognizes as those of Captain Douglas and Miss Blantyre, and her ungovernable curiosity leads her to look through a crack at the back of the summer-house, when she sees two more people kissing, and faints as before, to be found and revived as before by Milford, junior, who was staying at the house. Among the other visitors at this time at Wentworth is a sister of Mr. and Captain Douglas, a person whose existence will be necessary further on in the story. Captain Douglas, surprised at the way in which the little governess now begins to treat him, determines to go on the Continent, and, as if things had not conspired sufficiently to destroy Ella's peace of mind, she hears that her father, whose practice had almost dwindled to a shadow, is also bound on a Continental trip with Lady Constance Milford. She feels she is going mad, and it is not surprising to hear that, after a proposal of marriage from Milford, junior, which she declines, she is taken seriously ill and change of scene is recommended. Mrs. Douglas, with characteristic kindness, persuades her mother, Lady Barthwick, to take the heart-broken girl to London. In the whirl of the London season Ella seems to recover rather rapidly, and makes the acquaintance of a bewildering number of nobility and gentry, and amongst them of the Earl and Countess of Brantford and Lord and Lady Eustone. One day at Lady Barthwick's Ella picks up a provincial newspaper and reads a paragraph to the purport that Mr. Hamilton, "the mysterious death of whose wife formed recently the subject of so much comment," was on the Continent with Lady Constance Milford, with remarks on the subject far from pleasing. The consequence is an action for libel by Mr. Hamilton against the proprietor of the paper, who turns out to be Mr. Thorburn, the wealthy ironmonger, and the counsel for the plaintiff is made the medium of the explanation of all the mysteries in the preceding two volumes. What this explanation is it would perhaps be hardly fair to the author to reveal, for while this is one of the things with which we have to find most fault in the book, it is also a well-ascertained fact that one of the pleasures of novel-reading lies in finding out mysteries for one's-self. It may be thought that in this case there is too much bulk and too much variety of mystery.

In small doses mystery is valuable and tends to create interest; but it becomes irksome when it is pumped upon one. Why did Lady Constance behave as she did? Why did the lady's-maid's mother behave as she did? Why did the mysterious Mr. Hamilton allow people to think he is a murderer when one word would have undeceived them? And why did not Mr. Thorburn, who knew all the circumstances, and who knew that he was making himself liable to imprisonment for unwarrantable libel, apologize publicly and save himself from ruin? Why—— but we will not ask any more questions. The answer is, alas! too evident. The three-volume novel must be written, and hence these impossibilities. Miss Beryl Hope has attempted the task of writing a three-volume novel, with what success we leave it to the reader to judge. Rubbish—that is to say, clever rubbish—will certainly help to while away some hours at the sea-side during the summer holidays. There are portions of this novel which have merit, but they are immediately followed up by situations which, when compared with real life, do not stand the test. The most contemptible individual in the book is the hero, who is mean enough to make a girl in an inferior station of life violently in love with him, and yet has not the courage to declare himself publicly. *The Shadow of a Life*, shorn of half its improbabilities, would perhaps have been a good novel.

JAMES'S INDIAN INDUSTRIES.*

In order that the pressing problem of the weal of British India may be brought well within the scope of general educated opinion at home, there is much need of manuals or books of reference fitted to bring home to minds of average intelligence the primary facts on which may be built up a sound and trustworthy knowledge of the material resources of India and the industries engaged in their development. Especial value must of course attach to reports or statistical compilations which embody the results of individual and practical experience. It is from this point of view that Mr. Eliot James's *Indian Industries* claims to speak with authority. In addition to what he has brought together from the best known and most authoritative books, official documents, and other public sources, he has brought to bear his personal knowledge of the country, from which he has for some years retired. With these materials he has incorporated several papers on detached subjects of interest which have appeared from time to time in the *British Mercantile Gazette*, considerably enlarged, if not substantially re-written. His facts and figures show signs of careful and conscientious compilation, and of candour and impartiality in statement.

India's real wealth, Mr. James with unquestionable truth insists, lies in her land. It is with agriculture that his survey commences, as the basis of all Indian industries and the inseparable condition of all commercial enterprises. He is no blind optimist, nor does he shut his eyes to the fact that the fertility of Indian soil has decreased of late years, the yield of produce being smaller than it used to be, and the quality of the land, be it from exhaustive cropping, continued drought, or whatever cause, deteriorating yearly. But he shows himself no less convinced that many, if not all, of the causes of deterioration are transitory or exceptional, such as enlightened measures of improvement can dispose of. The primary want of India is unquestionably capital, and with it the introduction of improved implements and other appliances of agriculture. Many native prejudices are to be got rid of. The usurer's grip of the poverty-stricken ryot has to be relaxed. Rotation of crops has to be more generally practised. The establishment of a Department of Agriculture, bringing the Government into direct relations with the farmer, and having power to advance money and provide savings banks, is strongly urged by our author in accordance with the plan of Mr. Hume. He might have made a more encouraging point than he has thought fit to do of the great and growing export of cereals, especially of wheat, for the European market. It may be that he had before his eyes the fear of Mr. Hyndman and the croakers of his school, who see "the life-blood of the great multitude ebbing away" because of twenty millions' worth of agricultural produce annually leaving the country, and this "without any direct return being made for it." We are reminded by this of the standing grievance of a certain school of Irish patriots, that millions of cattle, sheep, and pigs are carried off every year to feed the Saxon. Allowing for the exceptional circumstances of the late famine, which may be largely averted in years to come by schemes of irrigation and improved transport, there has been no such thing as a hopeless falling off in agricultural prosperity. The value of wheat exported has risen by steady steps of progress from 82,70,064 rupees in the years 1873-74, to 2,85,69,899 in 1877-78. To the many admirable qualities of the native cultivators our author's experience enables him to do justice. They well know the condition of the soil, and the seasons. They are unflagging in industry, cleanly in husbandry, and adepts in harvesting and storing grain. As for the absence of weeds, their wheat-fields would in this respect shame ninety-nine hundredths of those in Europe.

Taking in alphabetical order what may be called in comparison with agriculture the minor industries, but which in the aggregate are of vital importance to the wealth of India, Mr. James begins with the steady increase in the brewing of beer, chiefly for consumption by the army. In the Bengal presidency alone some 5,000 hogsheads of beer are required by the troops. The substitution of hill-beer, which we are assured the men find equally good, involves a direct saving. The risk of loss by climate is for the most part done away with, whilst the demand for hops brings a reflex advantage to the growers of Kent and Sussex. Already a complaint has sprung up that the profits of hill-breweries are enormous and unfair to the consumer, though the Murrie Company, the most flourishing of all, has never divided, according to Mr. James's figures, more than 10 per cent. Cacao, or cocoa, introduced into India from South America, is a thriving industry, the Trinidad variety being the most successful. Carpets, once the special trade of India as of all Oriental countries, have sadly fallen off in taste, owing to the influence of false and vulgar patterns from Europe. This industry is now carried on chiefly in gaols, a practice open to much question on grounds of economy and general policy. To those who pin their faith to Liebig's famous dictum, "Tell me what a country's consumption of sulphuric acid is, and I will tell you what her wealth is," there may be an omen of ill in the falling off in Indian chemicals. The exports of saltpetre declined in value from 464,974*l.*, in 1874, to 379,002*l.* in 1878, a similar falling off being manifest in borax. A list of minor chemical products is appended by the author, but their quantity is not such as to call for statistical enumeration. The growth of

* *Indian Industries*. By A. G. F. Eliot James, Author of "A Guide to Indian Household Management," &c. London: Allen & Co. 1880.

chinchona has been attended of late years by a very important increase. The export of this valuable drug is not indeed likely to interfere at present with the interests of Peru, but the amount already grown is enough to meet largely the need of bark for local purposes, saving the Government some 12,000 rupees annually, and promising to add progressively to the health of the troops. A short but interesting sketch of the introduction of the chinchona plant into India from Peru is given by Mr. James. A far more important industry, that of coffee, has had very fluctuating fortunes. Neither in India nor in Ceylon does it seem able to hold its own against rival sources of supply, judging from the recent reports of the Ceylon Coffee Company (Limited) at home, and the falling off in Indian exports set down in our author's tables. The leaf disease and the ravages of the borer combine to keep down the yield. Much is expected from the introduction of the new Liberian coffee, with its large and hardy variety of berry; but it must be doubted whether the growth will be found once more capable of such a marked rise as that which it attained on the equalization of the duties with those on the West Indian products several years ago.

On the subject of cotton there is nothing very new to be said. Mr. James gives a rapid outline of the history of the plant and its manufacture, and dwells briefly but with point upon the drawbacks which check the competition of Indian staples with the produce of America and other cotton-growing districts. In spite of diminishing exports of the raw material, he is hopeful of a revival of the industry by means of better seed, ample capital, improved machinery, and more intelligent care. With regard to the cotton manufacture, he supplies facts and figures which make this one of the most instructive portions of his book. The value of cotton twist and piece goods having more than doubled between 1873-4 and 1877-8 goes far to explain the alarm which has spread of late among British manufacturers. To what extent the remission of the import duties upon cotton goods, under the regulation of 1878, is likely to serve the interests of Manchester, for the sake of which a grievous wound was inflicted upon the fiscal system and the struggling manufacturers of India, is a matter of much doubt. The facts adduced by Mr. James go far to justify his belief that Manchester will fail, after all, to contend with the Indian mills in respect to the precise class of goods they are in the habit of turning out, however the Indian market may be flooded with the new class of shirtings from Manchester. The cotton mills of Bombay, he points out, have made since the date of their first starting in 1854 very rapid progress. No less than forty-one spinning and weaving mills are now at work in that Presidency, while in Calcutta there are three, in Madras two, at Cawnpore two, at Nagpore one, in all India fifty-three, giving work to 10,533 looms and 1,289,706 spindles. These figures would not, perhaps, be much thought of at Manchester or Oldham, but they show a very fair beginning. Anyhow, as our author fairly argues, it is quite time that a wider and less selfish policy should take the place of that which has so long kept back our great Eastern dependency in the path of progress. "If Indian interests and English interests once come to be considered identical and therefore inseparable, then trade jealousy, which is the real barrier between the two countries, will be laid low, and Lord Metcalfe's prophecy that India would be lost upon the floor of the House of Commons—*i.e.* sacrificed to party interests—will stand no chance of fulfilment." This indeed may be taken as the key-note of Mr. James's work throughout. The same moral is illustrated and enforced in the case of each successive industry that makes up his survey. It has been to British, not Indian, interests that our policy has been addressed. India has been treated as a mere forcing-house for raw produce, cotton, rice, seeds, and jute, Manchester claiming in return the monopoly of dressing the natives in long cloth. We have not space to go in adequate detail into the later portions of Mr. James's work. The prospects indicated by many of the principal industries are chequered, progress in some being set against decline in others. In seeds the export trade has advanced from 3,850,000*l.* in 1857 to 13,560,000*l.* in 1877, something near 274 per cent. Seed-growing, however, is highly exhaustive of the soil, and must be kept up by copious manuring and careful rotation of crops. The exports of both raw and manufactured silk have fallen off considerably of late years. Spices, on the whole, show an equal decline, although in some branches of the trade, as in betel, largely exported to China, and for the cardamoms, formerly known as grains of paradise, there is an increasing demand. Of sugar India is the original home, from the Sanscrit *sarkarâ* having come the Persian name *shakar* and *shakkar*, the Arabic *sokkar*, the Latin *saccharum*, and later European names. Mr. James traces briefly the history of this important industry, with an estimate of the probable effects of recent legislation upon its development in India. On the whole, he is disposed to look forward to a good time coming for Indian sugar. In tea, despite the unhappy season of 1879, in which Assam and Bengal shared to the full the damps and darkness of the home country, the advance in exports has been highly gratifying, and the Indian tobacco trade has as largely developed within the last few years. A clear view of the fluctuations of every branch of industry may be had at a glance from the table of quantities and value, as far as can be ascertained, of the chief articles of Indian produce and manufacture exported from British India in the three years ending March 31st, 1876-78, appended from Mr. O'Conor's *Review of the Trade of British India for the Official Year* 1877-78, the most authentic and complete of all the official papers relating to our Eastern trade.

FRENCH LITERATURE.

A VERY interesting volume of correspondence (1), edited by M. Troubat, shows Sainte-Beuve in his best, and perhaps also his truest, light. The letters which fill this volume cover the whole period of the critic's life, from his schoolboy days onwards, and the impression derived from so large a number of documents, extending over more than half a century, and addressed to hundreds of different persons under the widest possible differences of circumstance, can hardly be erroneous. Those letters which are written to his earliest friend, the Abbé Barbe, are particularly interesting, and the manner in which the writer strives, without disguising his own change of ideas and convictions, to respect his friend's principles, is peculiarly noteworthy. Very remarkable, too, from the point of view of literary history, are the pains which Sainte-Beuve, unlike almost all his compatriots, takes to be accurate in matters of English orthography. Even M. Louis Blanc, after a ten years' residence in England, murders the names which he must have had before him a hundred times in print, in the most barbarous manner. When Sainte-Beuve has occasion to mention the sanctuary of English Government, he carefully writes to an English friend to know whether it is "Dowing" Street or "Downing" Street, and when he wishes to allude to an essay of Charles Lamb's, he asks the same friend to come and call on him that he may compare notes and be quite sure that he has caught the spirit of his author. In short, no small portion of this book is simply an extended illustration of a well-known saying about genius and the capacity for taking pains. Yet another class of documents of an attractive kind is the class of answers to literary correspondents. These are, as a rule, occupied with the giving (or the avoidance of giving) gratuitous criticisms on the works which these correspondents have sent him. The patience with which he whose time was his bread, and who always had plenty to do with it, seems to have undertaken the drudgery of proof reading, and the very thankless task of giving advice, is surprising. His private criticisms, too, are equally free from ill-tempered asperity, and from the much more usual fault of insincere praise, given with the object of getting rid of a troublesome task with the least possible trouble. Here and there too are scattered judgments of the greatest value. A letter written so long ago as 1835 on the subject of Victor Hugo will make the *Hugolâtres* very angry; but contains a verdict in which all reasonable persons who are able to keep the personality of a writer and their estimate of it apart from the question of his literary value will concur. Altogether the volume must be pronounced not only one of unusual interest in itself, but one which goes far to compensate the memory of the writer for some late exposures which were at least as unfair as they were damaging.

M. du Boys speaks (2) of having gathered new proofs as to the origins of the "work of darkness," as he calls the transformation of the Church of England under Henry VIII. It does not, however, appear that the novelty is a novelty, except to French readers. M. du Boys seems to have industriously read the State Papers calendared by Messrs. Bergenroth, Brewer, and Rawdon Brown, which for a Frenchman is no doubt something of a feat. He seems also to have an open and inquiring mind, imbued, however, with a considerable tinge of simplicity, as will be obvious from the fact that his main complaint of Henry and of the Anglican Church generally is the violence done by them to liberty of conscience. He expresses this in an elaborate dedication to Cardinal Newman, and the Cardinal's reply is beyond all question the thing most interesting to Englishmen in the book. A more admirable economy has very rarely been displayed by any master. It should be mentioned that M. du Boys is dreadfully afraid of a great anti-Christian or anti-Catholic Empire with persecutions of the Neronian kind. This is how the Cardinal accepts his dedication:—"I thank you for the compliment you pay me in proposing to dedicate to me your work on Catherine of Aragon. Certainly, as you say, the Anglican Church became the established religion by the application of tyrannical force. I trust that now there are very few of its members who wish to use such means of upholding it, or would profess or act upon the principles of Cæsarism." There certainly is no loyal Anglican who will refuse to endorse this at the present day. Perhaps it should be added that M. du Boys is much comforted by the fact that on the 27th of February, 1844, the Cambridge Union affirmed a motion regretting the dissolution of the monasteries.

Somewhat less unctuousness of style would have made M. de Baillon's sketch of Mme. de Montmorency (3) more readable, but even as it is it can be read. The heroine, Marie Orsini, or Des Ursins, wife of the unlucky Montmorency, who paid the usual forfeit for trusting to the rottenest of all reeds, Gaston of Orleans, has a really great reputation for her misfortunes and her piety. Historically she ranks with other victims of Richelieu's ruthless, if necessary, resolve to bind together the jarring elements of feudal France, and she has even something of a place in literary story by virtue of the protection extended by her husband and herself to Théophile de Viau and to Mairet. These claims to remembrance, together with the odour of sanctity in which she expired, perhaps give her a fair claim to a biography, and it would probably be unfair to quarrel with M. de Baillon for having written the life of a saint in the usual dialect of hagiology.

(3) *Madame de Montmorency.* Par le comte de Baillon. Paris: Didier.

M. Alphonse Karr's later publications may be described as ever nearer approximations of the ideal treatise *de omnibus rebus*, &c. He disclaims, with almost unnecessary modesty, the invention or the attribution to his own work of the somewhat pretentious title under which the volume before us (4) and its component parts in times past have appeared. As, however, it is in reality devoted for the most part to speculations of a practical kind, there is no reason to [illegible] its name. Of course there must be a difference of [illegible] the goodness or badness of the sense contained in M. [illegible] dissertations on subjects so various as modern feminine [illegible] the merits of universal suffrage, the importance of rewarding those who throttle mad dogs, the best method of disposing of the dead, the value of grasshoppers, divorce, the Income-tax, &c. It must also be confessed that M. Karr is by no means so amusing when he is discussing such subjects as when he is retailing the literary anecdotes he has amassed in his long life, or describing his personal adventures at Sainte-Adresse or at Nice. Everybody, however, cannot be expected to be amusing at all times and in all places. If average newspaper work contained as much, we do not say *bon sens*, but good writing, as do these "grains," the readers of newspapers would assuredly have little to complain of.

The eighth volume of M. Louis Blanc's reprinted English letters (5) is concerned with the year 1868, and busies itself with Fenianism, with the Irish Church, and, above all, with the elections of that year, and the change of Ministry. The volume seems to us, though perhaps this may be fancy, to be distinguished beyond its fellows by the ruthless mangling of proper names, and by the evidence it contains of its author's inability really to understand the events that were passing before his eyes, or indeed to do anything but to look at them through a pair of carefully prepared spectacles. Not merely at this distance of time, but after the most careful remembrance of the facts at the time of writing, his estimate of the political importance of J. S. Mill strikes us as a singular instance of this.

It is perhaps something of a sign of the times that an Academician should have thought it worth his while to put a collection of popular tales (6) into literary language for the benefit of all and sundry. Severe "folk-lorists" will perhaps be wroth with M. Xavier Marmier for adulterating their treasures; but, if so, they will be wroth without cause. M. Marmier, indeed, cannot be said to have actually improved the myths, like his predecessors Perrault and Hamilton, while his preface bears witness to a somewhat incautious swallowing whole of the atmospheric and meteorological theories; but any telling of the stories which have delighted so many generations of men all over the face of the earth must be welcome. M. Marmier has been careful, as far as possible, not to take the best known stories—those of England, or France, or Germany—but to explore the treasures of Slav, Scandinavian, and Eastern mythology, at which of late years so many hands have been working. We can hardly imagine a better reading-book for very young children—and it need not be said that the study of French can hardly be begun too young—than this book, which unites at once fascination of subject, strict propriety of treatment, and the mastery of classical French, which, to do them justice, the forty geese that guard the capitol—as a goose who was not admitted to guard the capitol called them—rarely fail to display.

A very great interest is now felt in France in the reorganization of the higher education, and the issue of a reprint (7), under the editorship of M. Scherer, of the essays of the late M. Bersot on the subject is a proof of that interest. As Principal of the Ecole Normale Supérieure, M. Bersot had an official position in reference to the question, but this official position by no means exercised upon him the benumbing effect which it is sometimes thought to have. Indeed, M. Bersot may be said to have been a decided Radical in educational matters. Many of the papers here reprinted are of old date, and carry us back to the early days of the Empire. But in one which is no older than last summer the retention of Latin composition among the subjects for the Bachelor's degree—a question since, if we mistake not, decided by M. Jules Ferry in the innovating sense—is vehemently attacked. M. Bersot, like a good many of his compeers in England, was also a violent foe of examinations, and seems, on the whole, to have been inspired by much of what is called the modern spirit. A paper on MM. Demogeot's and Montucci's well-known Report on English Grammar-schools does not impress us with the idea that he was well acquainted with the comparative history of his subject. He seems to know nothing of English education except from the book he is reviewing, and to be by no means certain of the distinction between "school" and "college."

Few volumes of travels seem to have been recently published and of those before us one is the record of a somewhat ordinary tour, another a reprint of a book first printed a quarter of a century ago, and the third a volume of sketches rather of literary than of geographical or adventurous interest. M. Cotteau (8) has told the story of his two journeyings—the first to the Philadelphia Exhibition and North America, the second round the coasts of the Southern continent in the Pacific Steamship Company's steamers—in a sufficiently fluent and interesting manner. His ground is, of course, pretty well-beaten ground; but he justly observes that his own countrymen have less to do with beating it than the inhabitants of almost any other European country. A man who has been round the world is still something of a wonder in France. M. Guérin's book on Rhodes (9) was the best book that had appeared on the subject in the last year of the Crimean war, and it has not been superseded since. As for *Histoires de voyage* (10), the author of *Les iambes*, if he has not in his long life quite fulfilled the promise of that remarkable book, can write nothing that is not worth reading as a piece of French. The present volume is a mixture of narrative and description, and has the additional attraction of being unambitiously, but very fairly, illustrated.

M. Alfred Fouillée has written a stout volume (11) on sociology which contains a good deal of criticism of his predecessors. The principal idea of his book seems to be a comparison of the two main theories of society, one of which takes it to be a voluntary coalition for a definite purpose, the other a result of evolution like any other organism. M. Caro's prize essay on Goethe (12) adds another to the author's already respectable list of philosophical works. The examination, as usual with M. Caro, is careful and in the main sober enough. An appendix contains some *pièces* in the shape of translations of detached passages of Goethe's directly philosophical works. These being, on the whole, much less known than the purely literary writings of the author of *Faust*, M. Caro's idea of presenting them to his readers was not unhappy. M. Cantacuzène (13) has followed the example of several other translators in presenting to French readers certain of the thoughts and sayings of Schopenhauer. At first sight that driest, in the wine sense, of all philosophers might not be thought likely to hit the French taste. But the time has gone by for offhand judgments of this kind on national tastes and characteristics. The translation is good, and the virtue of the original survives very fairly in the version.

M. Léon Danicourt (14) is a shorthand writer in the Chamber of Deputies, an office of more importance in the country of official reports than here. Apparently M. Danicourt has a soul above the mere reproduction of others' speeches, and he has determined to discuss questions of *haute politique* for himself. His work is not ambitious in scale, and this is perhaps the most that can be said for it. His views are neither extravagant nor destitute of common sense, but they are not very novel or very forcibly put.

It may be laid down without fear of contradiction that in preparing for examination nothing is so useful as an ample selection of test examination papers. M. Laurent's little book (15) ought therefore to have plenty of customers. But we wish the answers had been left out.

M. Dufay in *La légende du Christ* (16), M. Wilfrid de Fonvielle in *Les miracles devant la science* (17), hunt very old trails without displaying any particular aptitude in sportsmanship. It is interesting to know that M. de Fonvielle does not wish to stir anybody up against the clergy. He knows no enemy of France except the people, "dont la morale se résume dans les mots la force prime le droit." We do not quite see the connexion of the unfortunate Germans with the question whether Noah could or could not see in the Ark (for by such venerable engines does M. de Fonvielle conduct his assault upon supernatural religion). But perhaps the author does.

M. Sayous's pamphlet (18) is an interesting discussion of a matter of some historical importance. It deals incidentally with some of the curious Judæo-Arabian sects of heretics, who undoubtedly had a considerable formative influence on Islamism.

A short tract on electoral reform in France (19) may deserve mention. The author proceeds on the principle that the preponderance of the majority and the representation of the minority are things to be concurrently aimed at.

The third number of the *Revue des arts décoratifs* (20) contains among other things a paper on Galland, the decorator, and a sample of his work, which is not particularly attractive, together with a representation of a beautiful pier-glass, designed by Prudhon, and another of some sixteenth-century woodwork rather resembling metal in delicacy and character of design.

Among the few novels of which we have to give account this month *Renée Mauperin* (21) deserves the first place, if not for intrinsic worth, at any rate for age and for a certain literary importance of the historical kind. It was one of the earliest books in which MM. de Goncourt set the example of naturalism, and considering

the remarkable fruits which the tree has since borne, the seed may have a certain interest. We cannot, however, say that *Renée Mauperin* seems to us intrinsically to deserve republication in the charming little collection known as the *Petite Bibliothèque Charpentier*. Less audacious than *Germinie Lacerteux*, it is also less powerful. Mme. Henry Gréville's mixture of humour and pathos is very well illustrated in *L'héritage de Xénie* (22). The dialogue is especially good, and many of the speeches of the heroine and her mother are possessed of a pleasant crispness which no French novelist, save Mme. Gréville, and now and then M. Cherbuliez, knows how to give. The plot is perhaps a little spoilt by French mother-worship. *Les demi-mariages* (23) is intended to illustrate the evil effects of the granting of an unlimited faculty of divorce, and it is more effective than most novels with a purpose. *Le remords du docteur* (24) is a rather well-put-together story, involving a curious question of casuistry. A doctor on one occasion saves a life, thereby causing—as he knew at the time he should cause—a great deal of annoyance to some very excellent people. Afterwards he, half deliberately, neglects to save another life, thereby making some excellent people very happy. *Quaeritur*, for which act ought he to feel remorse? Lastly, *Le château de Castelloubon* (25) is a fair, but rather spun-out, tale of *diablerie*. Some tourists pass the night in a haunted château, and the evil spirits revenge themselves on their disturbers tragically and ingeniously enough.

(22) *L'héritage de Xénie.* Par Henry Gréville. Paris: Plon.
(23) *Les demi-mariages.* Par Paul Perret. Paris: Plon.
(24) *Le remords du docteur.* Par Georges Vautier. Paris: Ghio.
(25) *Le château de Castelloubon.* Par L. Couste. Paris: Ollendorff.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, *including postage to any part of the United States, is £1 10s. 4d., or $7 58 gold, and may be forwarded direct to the Publisher,* Mr. DAVID JONES, *at the Office,* 38 *Southampton Street, Strand, or to* Mr. B. F. STEVENS, *American Agency,* 4 *Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.*

PARIS.

Copies of the SATURDAY REVIEW *may be obtained every Saturday of* M. FOTHERINGHAM, 8 *Rue Neuve des Capucines.*

THE EUROPEAN CONCERT.

THE conflicting reports of the intentions of the Turks, the Albanians, the Montenegrins, and the great European Powers are not the less confusing because they may perhaps all at short intervals of time be successively true. The SULTAN'S caprices vary from day to day; the Albanians incline to yield or to resist according to the news from Constantinople. Sometimes it is said that the Catholic Albanians regard without repugnance annexation to Montenegro, in the hope that the eventual result would be absorption in the Austrian Empire. They may perhaps overlook the almost certain contingency of a preliminary war; for Russia would unquestionably not surrender without a struggle the Principality which has so long served as an outwork against Turkey. The Mahometan Albanians alternately profess their devotion to the SULTAN, and their determination to assert their independence if they are deserted by their natural sovereign. The most prudent of all the parties to the local struggle appears to be Prince NIKITA of Montenegro. He is said to have agreed to abandon his claim to Dinosch and Gruda on condition of the peaceable surrender of Dulcigno. Some newspaper Correspondents add that the PRINCE not injudiciously declines to risk the lives of his subjects in an enterprise which the European Powers are, in his opinion, pledged to accomplish. He is perhaps entitled to assume that a powerful fleet has not been collected on the Adriatic coast for the mere purpose of looking on while the Albanians, the Montenegrins, and perhaps the Turks decide their quarrel. The only flaw in his supposed reasoning is that he possibly attaches too definite a meaning to the supposed European concert.

A Correspondent who seems to be well informed publishes unsatisfactory accounts of the state of feeling in the harbour of Ragusa. The Italian contingent, by some awkward misunderstanding, neglected to salute the Austrian flag; and, though the mistake was afterwards corrected, it may have left disagreeable feelings behind. Much stress is laid on the tact and good sense of Sir BEAUCHAMP SEYMOUR, who is fortunately the senior Admiral of the squadron. The reporter significantly adds that no influence of manner or character can effectually repress the bad temper and ill-breeding of others. The delay of the French ships in arriving naturally suggested a doubt whether their Government was hearty in the cause; but they arrived at last. It is still uncertain whether the commanding officers of the contingents are furnished with identical instructions applicable to the various contingencies which may occur. The English Admiral gives technical and professional orders; but he must consult his colleagues on political questions. No troops are to be disembarked; but the Admirals have power to bombard. The critical Correspondent is disposed to think that intervention would be most advantageously undertaken by the English squadron alone; though it would be a strange result of the laborious efforts to establish a European concert if only one of six Powers were at the last moment prepared to act. The centrifugal forces betray their existence at every moment; yet it must not be forgotten that the motives which induced the Powers to agree on the so-called demonstration will continue to operate until the object is finally attained. The fleets have not been ordered to Ragusa for the purpose of illustrating the vacillation and bad faith of the respective Governments. It is possible that the calculated delays interposed by the SULTAN may be directed rather to the postponement of the question of the Greek frontier than to the avoidance of the cession of Dulcigno to Montenegro. If any want of harmony among the combined Governments or their naval representatives should disclose itself during the present operation, the Turkish Government would be encouraged in its resistance to the decrees of the late Conference at Berlin.

The proverbial method of maintaining peace by preparation for war appears in recent times to have superseded all friendly or philanthropic methods. Every overture made by one Government to another indicates hostility to a third Power. When Prince GORTCHAKOFF a year ago made advances to France, he was actuated by resentment against Prince BISMARCK for his share in the Treaty of Berlin. The proposal was immediately followed by the virtual alliance between Germany and Austria which elicited from Lord SALISBURY too outspoken an expression of satisfaction, while it suggested to Mr. GLADSTONE the suspicion of a conspiracy against the pretensions of his Servian and Bulgarian clients. It is now stated that a more definite proposal of an offensive and defensive alliance was made by Prince GORTCHAKOFF, and unaccountably communicated by M. WADDINGTON to Prince BISMARCK. Mr. GLADSTONE'S wanton and unstatesmanlike attack upon Austria, and the threats which he insinuated even in his apologetic letter to Count KAROLYI, have been answered by the recent visit of Baron HAYMERLE to Prince BISMARCK. Neither statesman is likely to have apprehended an alliance between England and Russia which should extend to concerted warlike operations; but Germany may perhaps have undertaken in certain contingencies to support the extension of Austrian dominion which Mr. GLADSTONE denounced in an offensive phrase. It is believed that Italy has, in consequence of differences with France on some African subject of dispute, indicated a disposition to join the league of Germany and Austria. M. GAMBETTA'S late speeches, though they admit of a more favourable interpretation, have been understood at Berlin as threats. That Powers all reciprocally jealous of one another have been induced to concur in a measure which is almost an act of war might be regarded as a triumph of English diplomacy, if the objects and motives of the naval demonstration were intelligible and certain. One incidental and advantageous result of the combination is the impediment which is offered to separate action on the part of Russia. The enforcement of one of the provisions of the Treaty of Berlin is clearly within the competence of the signatory Powers, though it is not known how far they insist on their right.

It is extremely doubtful whether they will be even approximately unanimous on the more important question of the addition of territory to Greece. The cession is not imposed on Turkey by the Treaty of Berlin; and France, which originally proposed the aggrandizement of Greece, has, for reasons which have not been fully explained, declined to enforce the recommendation. On the other hand, the present English Government cordially supports the claims of Greece to which Lord BEACONSFIELD and Lord SALISBURY had apparently become indifferent. Austria and Germany take no active interest in the matter; but Russia will not be indisposed to furnish an excuse for the revival of agitation in the Slavonic provinces. The Greek armaments, though they are ostentatiously pro-

seceded, will probably exercise little influence on the result. The Turks, with the aid of the Albanians and the Mahometan residents in the territory in dispute, will be more than a match for the Greek levies. Before the struggle commences the SULTAN and his advisers will ascertain whether they have to apprehend the interference of the Great Powers. There is for the present no want of apparent unanimity. All the Ambassadors at Constantinople have agreed to the comments which are supposed to have been drawn by Mr. GOSCHEN on the Turkish project of reform in Armenia. As might be expected, the representatives of the Powers remark that no sufficient guarantee is given for religious equality, and that the more urgent duty of protecting the peaceable population against the Kurds and Circassians is not sufficiently provided for. They might have added that a more plausible document would have had little value, as long as the central and provincial administrators are inefficient and corrupt. If it is true that Colonel BAKER has been placed at the head of the armed police, the appointment is worth many projects of reform. If he has at his disposal a force paid with moderate punctuality, he will not fail to deal vigorously with the freebooters who are the worst of many evils. Mr. GOSCHEN has probably discharged his duty of remonstrating and threatening with vigour and assiduity, but he can scarcely have used stronger language than that which was habitually addressed to the Porte by Sir H. LAYARD under the instructions of Lord SALISBURY. The only recent change is the substitution of collective warnings and threats for the separate remonstrances of the English Ambassador. The SULTAN may perhaps be puzzled by a unanimity of which he may have some reason to doubt the genuine earnestness.

M. DE FREYCINET AND THE CHAMBER.

UP to this time M. DE FREYCINET has undoubtedly shown that his determination to take a line of his own on the question of the religious orders is something more than a mere whim, or than an impulsive attempt to manifest his independence of M. GAMBETTA. Whatever may be the issue of the present Republican rebellion against the leader of the Left, it promises, if M. DE FREYCINET goes on as he has begun, to give France a second politician of the first rank. Hitherto among working Republicans there has been only one. Since M. DUFAURE'S resignation the Republican Cabinet has been merely M. GAMBETTA'S warming-pan. The puppets were put into their places and taken out of them again just as it suited his sovereign will. Down to this time, too, M. GAMBETTA has been justified of his puppets. The best evidence they could give that they were in their proper places was to show that they were fit for nothing better. That M. DE FREYCINET will succeed in carrying the Chamber with him is certainly improbable. Whether he is right or wrong in the estimate he has probably formed of the state of public feeling on the question of the decrees, there is no apparent reason to suppose that the existing deputies are inclined to waive or even delay their execution. When M. DE FREYCINET spoke of the dissolution of the Jesuit establishments as a concession to the feeling of the Chamber which had made it possible to pursue a more conciliatory policy in regard to the other orders, he may really have been thinking of the constituencies. They may be disposed to draw a distinction between one order and another, though the Chamber is seemingly bent upon including them in a common condemnation. It would be premature, however, to assume that the conversion of the PRIME MINISTER will have no influence on the deputies by whose support he holds office. French politicians are not less sheep-like than those of other countries, and the fact that M. DE FREYCINET sees reason to pursue a different course from that which he has hitherto taken may bring round a portion of the Republican majority to the reasonable views which he is now defending. If M. DE FREYCINET were the leader of the Republican party as well as the chief of a Republican Ministry, this result would be very much more probable than it is. But however the matter is looked at—unless, indeed, M. GAMBETTA is to be credited with an extraordinary tortuousness—to support M. DE FREYCINET now is to oppose M. GAMBETTA. The whole history of the last few weeks is unintelligible, unless we assume that M. DE FREYCINET believes that the Radical policy towards the religious orders is not a prudent policy for the Republicans to adopt, and wishes to convey to his countrymen that, if they agree with him in thinking this, he is willing to provide a rival policy for their acceptance. It is not easy to believe that M. DE FREYCINET'S return to moderate views will outweigh M. GAMBETTA'S adherence to extreme views. At all events, if it does so, it will be in the country rather than in the Chamber.

According to the principal authority upon this curious passage in contemporary history, M. DE FREYCINET has on his side a personage whose importance where Ministers are concerned is not exclusively titular. "According to a "source worthy of credit," says the Paris Correspondent of the *Times*, speaking of the Cabinet Council held on Thursday, "the President of the REPUBLIC openly manifested his approval while M. DE FREYCINET was stating "the motives that had guided him," and a little later in his letter he speaks of M. GRÉVY as one "who, it is certain, "shares, approves, and approved beforehand, M. DE "FREYCINET'S views and attitude." The President of the REPUBLIC cannot secure victory to a Minister, supposing that the Chamber is persistently hostile to him, and is supported by the country in its hostility. But he can do one thing by himself, and one thing in concert with the Senate, which may be of immense and even decisive advantage to a Minister. He has the appointment and dismissal of Ministers, and though he cannot retain a Minister in office against the wishes of the Chamber, he can present the issue to the deputies in the way he likes best. Under some circumstances this may be a very valuable power. Which party is the assailant and which the defender may make a great difference to the result of a Parliamentary conflict. There are times of course when it does not matter in the least whether the politician who challenges the verdict, whether of the Chamber or of the country, is in office or in opposition. The two last elections in England were cases in point. There is no reason to suppose that either Mr. GLADSTONE in 1874 or Lord BEACONSFIELD in 1880 gained anything by being in office at the time of the dissolution. In other cases however Ministers have gained a great deal by being able to await attack. And this advantage, such as it is, M. GRÉVY can give M. DE FREYCINET. If the PRESIDENT were opposed to him, he might ask for his resignation, and then replace him by M. JULES FERRY or M. CONSTANS. Being on his side, he can, if he chooses, ask M. FERRY and M. CONSTANS to resign, and thus enable M. DE FREYCINET to hold his ground with a homogeneous Cabinet until he can be dislodged by his late colleagues. This is what he can do by himself. What he can do in conjunction with the Senate is to hurry on a dissolution. Instead of waiting for the natural decease of the Chamber in 1881, the PRESIDENT and the Senate can dissolve it in 1880, and so enable the election to be taken on the specific issue on which M. DE FREYCINET has challenged the judgment of his countrymen. It is probable that a Senate constituted as the present Senate is would support the PRESIDENT in appealing to the electors. What the result of such an appeal would be it is of course impossible to say; but this much should be remembered by way of caution. The constituencies have never yet had the choice between a moderate and a Radical Republic fairly submitted to them. They have had to choose often enough between the Republic and other forms of government, and they have consistently answered that they prefer the Republic. But, if M. DE FREYCINET goes to the country on the question whether to execute the decrees or to allow the religious orders to profit by their recent declarations, it will be the first time that such an alternative has been offered.

If Frenchmen are determined to carry the quarrel with the Church to the last extremity, they will do so in the face of the largest concession that the Church has made for a very long time. It seemed likely that the treatment the Jesuits had sustained at the hands of the Government would unite both the other orders and the secular clergy in their defence. That this would have happened if the orders and even the secular clergy had been left to follow their own devices is almost certain. The whole language alike of lay speeches and Episcopal pastorals points to this conclusion. The strife between the Church and the Republic was one of long standing, and the moment when the Republic had just annihilated a most important ecclesiastical outpost did not seem a

time for offering terms. It may be suspected that the Pope could scarcely have done a more unpopular thing in the eyes of French Catholics than suggest a compromise between the remaining non-recognized orders and the Government. Leo XIII., however, has been true to his own character, and to his whole previous policy, and has brought the orders round to his view. The declaration recently issued is an extraordinary instance of turning the other cheek to an adversary. After the wrath of the Government had been shown in the closing of the Jesuit establishments, the Pope had still a soft answer ready. He could recognize that the Church had given some ground for the misrepresentations of which she had been the object, that her record as regards the powers that be in France had not always been irreproachable, and that, though her political ventures had only been for her hurt, she had provoked the injury by embarking on them. The declaration of the orders puts all this into words, somewhat diplomatic perhaps in expression, but sufficiently unmistakable in sense. If the French nation rejects this concession, they will be doing all in their power to make moderation on the part of the Church impossible for the future. The Pope's reactionary advisers will be able to point to the failure of the attempted compromise in France, and from this they will deduce the uselessness of compromise everywhere. This is a result which may suit well enough the purpose of the extreme Left; but, if it proves equally attractive to the Republican party generally, the prospect before the French nation is far from being wearisomely bright.

SIR WILLIAM HARCOURT'S ZEAL.

THE incurable wickedness of the unpaid magistracy is one of the articles of the Radical faith, and it is not surprising to find that the Home Secretary has endeared himself to the professors of that faith by his recent attack on certain magistrates. These evildoers "will," says the *Pall Mall Gazette*, "find Sir William a very different "sort of superior from Sir Richard Cross." A melancholy philosopher might find in this observation an illustration of the mutability of human affairs. Before the rage of the recent political controversy tarred the whole of the late Ministry with the same brush, it used to be frankly acknowledged by Liberal critics that Sir Richard Cross was an exceptionally good Home Secretary, the best that had held the office for many years, and almost, if not altogether, too good for a Tory Government. A few short months, and his name becomes an instrument for comparisons certainly not quite reconcilable with this former estimate. However, it must be granted to Sir William Harcourt's panegyrists that he is the most industrious and enterprising of officials. He will still be doing. Now he is visiting the scene of a colliery accident, and oracularly pronouncing that there ought to be "more shafts." Now he is issuing a very curious certificate of indemnity to the officers of the mine. Now he is snubbing an obnoxious magistrate, and demanding of him whether he has not beadles in his town and things called whips. The worst of this energy is that the same fatality which has attended Sir William Harcourt's steps throughout his tenure of office dogs him still. Unkind critics point out that the apparently sapient demand for more shafts is equivalent to a demand for the shutting up of the colliery concerned, a certain amount of income being only equal to the support of a certain outlay of capital. The awkwardness of the now famous Stroud case in which the Home Secretary has been attacked, routed, and compelled to seek the refuge of ignominious silence by a simple county magistrate, is greater still. The hardest heart must feel a certain sorrow for a Home Secretary in such a plight.

The case of Walter Dean made some little noise in the later days of the Session. A child of tender years had been sentenced to incarceration, with exhausting tasks, by the ruthless Dogberries of the rural magistracy. Sir William's attitude was what is technically termed in fiction and the drama "noble." He spoke of "poisoning "the fountains of life," and brought down the House thereby. It is true that the reversal of Walter Dean's sentence, which he at once, and without any inquiry, ordered, seems to have come a little late, but that has nothing to do with the matter. If the sentence was unnecessary and unjust, its reversal or annulling was undoubtedly proper. But the Home Secretary, perhaps because his time was too much occupied with hares and rabbits, or with amateur criticism on his own Government's Burials Bill, had omitted the usual ceremony of obtaining from the magistrate concerned some information on the matter. The maxim "Hang first and try after-"wards" is a well-known one, and has local currency in two very different quarters of England as "Lydford law" and as "Scarborough warning." Sir William has invented an ingenious variation of it—"Pardon first and "try afterwards"—which perhaps may be described as Home-Office justice. Unluckily for him, the incriminated magistrate, Mr. Watts Hallewell, appears to be a person with all his wits about him, and possessed of a temper cool but by no means meek. He replied to the Home Secretary's letter practically censuring his conduct and announcing the order of release by a singularly damaging history of Master Walter Dean. This tender infant, who, for the crime of breaking a paltry window or two, was sentenced to imprisonment, has a history which would do credit to a much more mature offender. He has set fire to a plantation, he has stolen on different occasions fruit, eggs, money, solid provisions, and a choice assortment of miscellaneous articles of property; while window-breaking, before it finally obtained for him the sympathy of the Home Secretary, had been practised by him with an assiduity which could not but make him perfect in the art. So far indeed the Home Secretary may be acquitted of anything but somewhat indecent haste. Unluckily for him, however, he had, as we have mentioned, asked Mr. Hallewell whether a slight corporal punishment under the Summary Jurisdiction Act would not have been sufficient. It is a little surprising to find that this recommendation has not revolted Sir William's Radical admirers. We had thought that corporal punishment was to them a thing abominable, that it was a degradation, an insult to the rights of man, and a dozen terrible things besides. It would, however, appear that they hate magistrates so much that even corporal punishment can be gulped down when Justices' justice is to be found fault with. Sir William, as it happens, put the rod which he suggested for Walter Dean's body into Mr. Watts Hallewell's hands to use against himself. For it seems that the Summary Jurisdiction Act does not authorize the infliction of any such penalty for the particular offence committed by Walter Dean. At least Mr. Watts Hallewell has for some days been respectfully awaiting a reference from the Home Office to the section of the Act under which he could have whipped Walter, and the reference does not come. On the whole, it may be granted that the conduct of Sir William Harcourt is remarkably different from the conduct of Sir Richard Cross. The latter most assuredly would not have exposed himself in this way to the double charge of *ignorantia juris* and *ignorantia facti*, neither of which is in this case an excuse, but a very serious fault. Oriental justice would probably have ended the matter by making Mr. Watts Hallewell Home Secretary and Sir William Harcourt a magistrate under his feet. But the history of the transaction may be thought to show that, though Mr. Watts Hallewell might make a very good Home Secretary, Sir William Harcourt would make an exceedingly bad magistrate.

It is curious that this odd substitution of a Minister's private notions as to the ideally fit for the humdrum letter of the law should not have been the first instance of the same kind given by the present Ministry. Nobody can have forgotten Mr. Forster's remarkable declaration as to what he was going to do during the recess if Irish landlords exercised their legal rights contrary to his, Mr. Forster's, sense of justice. "Never mind the law," said Mr. Forster. "Never mind the law," says Sir William Harcourt. We have not the least intention of maintaining that the birch would not have been an exceedingly suitable punishment for Walter Dean. Indeed the birch, and plenty of it, seems to be an excellent prescription for that promising young man. Having "poisoned the fountains of life" for a good many other people, or, in less poetical language, having made himself an intolerable little nuisance to his neighbours, it is quite right that the law, as representing those neighbours, should make itself a nuisance to him in the way which he is most likely to feel. But it is amusing to think of the howl of wrath which would have been set up by Radical members of Parliament, Radical newspapers, and Radical mouthpieces and mouths generally, if a ma-

gistrate had ordered corporal punishment in a case where the law did not empower him to do so. How the dignity of man and the ferocious stupidity of magistrates would have been trotted out and made to show their paces! What subscriptions would have been forthcoming for the purchase of plasters for WALTER DEAN's wounded back and for doing dreadful things to Mr. WATTS HALLEWELL! We might have had a St. James's Hall Committee, and a Britons' Corporal Rights Defence Association, and Heaven knows what else beside. But when Sir WILLIAM HARCOURT makes the suggestion, it is greeted quite warmly by those who would have done all these things, and we are told that a "short Act next Session" will make it all right, and that Sir WILLIAM has "wisely "declined to discuss" the matter with the Stroud justices. As to this latter point, indeed, there can be little difference of opinion, for it is certainly wise to decline a discussion in which there is nothing to do except plead guilty. But the incident in other times would certainly not have been thought particularly creditable to the Government. For it may certainly be contended that the person whose duty, more than that of any other single person, is to watch over the administration of the law should not recommend flagrant breaches thereof, and should take the trouble to acquaint himself with the facts of the case on which he takes the responsibility of deciding. Since this case it seems that Sir WILLIAM has undauntedly pursued his career of reversing magisterial decisions, or, to speak more correctly, of setting aside magisterial sentences. He has already done this in the case of a woman sentenced to imprisonment for giving a false certificate of death—an offence which is in general, if not in the particular instance, a very serious one; and we are told that the same result will, it is thought, follow in another case. Indeed, if Sir WILLIAM adopts the convenient method of judging all cases without paying any attention to the facts, it is not unsafe to prophesy that the same result will follow in all. It is an easy way to gain popularity; and if the law suffers, why so much the worse for the law. Besides, a short Act next Session will set it all right. Fortunately in the present constitution of Parliament the passing of a short, or indeed of a long, Act is, if the Government choose to have it, almost a certainty, and so there can be no difficulties in the HOME SECRETARY's way.

THE GOVERNMENT AND THE CITY COMPANIES.

THE City Companies must have anticipated their fate as it approached them by successive stages. The accession of the present Government endangered all ancient institutions, and in the first instance those which were intrinsically weakest. The issue of the Commission with the obvious purpose of depriving the Companies of the whole or a large portion of their revenues confirmed the gloomiest anticipations; and, finally, the appointment of Lord DERBY as chairman threatened uncompromising disregard of all claims founded on picturesque inutility. The governing bodies and their officers will not find it worth while to repeat the policy which their predecessors tried with success in 1833. It was then safe to refuse any revelation of the only secret which they greatly cared to keep, by disputing the power of Royal Commissioners to exact an account of their wealth. The answers of the Companies to the queries which have now been circulated are still voluntary; but any attempt to withhold information would be peremptorily overruled by Act of Parliament. It is not of good omen for the Companies that the Commissioners profess a desire to study their histories and antiquities. It may be taken for granted that in the lapse of centuries they have deviated from their original character and purposes, although they have with zealous fidelity preserved many of their early customs. Old duties which have passed into desuetude will serve as an argument for abolishing corresponding privileges; while banquets and other festive solemnities, however accurately they may have been handed down, will be condemned as unprofitable and obsolete. There are few institutions to which their members are for the most part as warmly attached; but even in the City mutinous liverymen are found to write letters to the papers in vituperation of the governing bodies. They might perhaps judiciously suspend the expression of their petty grievances till all dissensions are suppressed by a common disestablishment.

The collective revenues of the Companies have been vaguely estimated at half a million, and their advocates would find a difficulty in contending that a large income might not be more advantageously employed than in dinners, in pensions to decayed members, in maintenance of gorgeous halls, and in occasional encouragement of industry and art. Two or three of the richest Companies have within a few years contributed large sums for purposes of technical education; and as far as their contributions extend they have practically become trustees of the funds which they might at their discretion have retained. By some of the Companies moderate provision is occasionally made for needy members of the governing bodies; but it must be remembered that the recipients have in the first instance only enjoyed the hereditary right to membership on the payment of a heavy fine. Vested life interests will, as in all such cases, be protected; but the Government will probably propose to Parliament a scheme for dealing at discretion with a large surplus. All the members, including the liverymen, have votes; but they belong to a single constituency which has audaciously renounced its allegiance to Mr. GLADSTONE. There will be no danger of alienating the City, which will vainly regret and resent the destruction of the Companies, not only as an unwelcome change, but as a precedent for the approaching suppression of the Corporation. The Government which refused the City the opportunity of proving its importance by a special return in the Census has probably resolved on punishing it for its contumacy at the last election. The institution of one or more municipalities of London in the place of the ancient Corporation will raise important political and administrative issues. The total or partial confiscation of the property of the Companies will be a simpler operation, and it will serve as an instalment of the larger measure, or as a precedent for stringent legislation. The Colleges of Oxford and Cambridge will perhaps be later victims.

Lord DERBY will feel no sympathy with the doubts which may be suggested as to the expediency of putting an end to anomalies. If a capital amounting perhaps to some millions can without injustice to interested persons be diverted to more useful purposes, the most prosaic of statesmen will not hesitate to recommend the transfer. The attributes which are common to private and to corporate property are easily disregarded when there is an opportunity of exhibiting utilitarian liberalism. The popular clamour against the Companies is consistent as far as it is raised by the ordinary assailants of property. It seems shocking to the enemies of ownership that any fragment of wealth should be excluded from private and hereditary possession. Endowments, whether a share in the enjoyment of the funds is obtained by merit or by fortune, are by a curious paradox hateful to the revolutionary mind. That a feeble barrier should defeat cupidity is more irritating than the tenacity of individual ownership. An established Church, though it is in the distribution of its endowments a comparatively democratic institution, is in modern times more habitually threatened with spoliation than a private capitalist or landowner. The classes which might be expected to be most sensitive to attacks on property sometimes like or anticipate with short-sighted selfishness the demands of the mob. Rich noblemen have been heard to complain that College Fellows perform no definite duties in return for their incomes of two or three hundred a year. They have yet to learn that the hereditary owners of large estates ought not to be hasty in encouraging the prejudice against sinecures.

A courteous invitation to the officers of the Companies to furnish suggestions to the Commissioners would, if the general result of their inquiries were otherwise doubtful, imply a foregone conclusion of change. With the exception of official salaries recently fixed or readjusted, scarcely any public or private revenue is expended in perfect accordance with ideal utility. A formal investigation involves the assumption that the State or the Legislature has the right as well as the power to divert the funds into new channels. The restoration of the property of the Companies to the purposes for which it is supposed to have been originally intended may perhaps not be found easy or expedient. The Goldsmiths, the Fishmongers, and some of the other Companies already discharge certain technical duties which could not perhaps be usefully enlarged. The general encouragement of their respective trades by the Companies would in most cases

be impracticable or superfluous. Goldsmiths, mercers, and merchant tailors need little assistance; and there are no clothworkers in London. It would not be easy to define the technical education which is required to qualify a fishmonger for the practice of his mystery. The Commission and the Government will probably at present adopt an intermediate course between alienation of their whole property from the Companies and acquiescence in the present state of things. A certain discretion in the expenditure of the funds may be reserved to the governing bodies, perhaps with some change in their constitution. The hospitalities in which the citizens of London delight will be curtailed, though perhaps they may not be summarily suppressed. A large surplus will remain to be applied to objects of public utility, including perhaps the relief of general or municipal taxation. Speculative philanthropists, comparing possible modes of theoretical beneficence, have sometimes inclined to the opinion that the most effective form of charity would be a contribution to the Exchequer; but the possible acquisition by the State of property for its own purposes would be, in the invidious as in the literal sense of the term, confiscation. It is more probable that a part or the whole of the funds now belonging to corporate bodies in London will be applied in aid of local taxation. It might be found possible to distinguish between the luxuries and the necessary wants of a vast metropolitan population. The provision of parks, of bands of music, and of public recreations might seem to be a more suitable employment of accumulated funds in want of an owner than of the produce of rates. It might even be possible to connect the future with the past by giving the Companies, in some modified form, a voice in the expenditure for new objects of the revenues inherited from their predecessors. The social and festive traditions of special trades have in many cases become obsolete; but the reservation from private ownership of a portion of the wealth of the community is not in principle anomalous or inexpedient. Any revenues of the kind would be more properly expended in promoting popular enjoyment than in the discharge of the burdens which attach to all kinds of property.

THE WATFORD PLOT.

THE word "mystery" has been so often and so stupidly used of late in newspapers, that it has got into rather bad odour. It does not, however, seem that any much more appropriate term can be found for the extraordinary occurrences which took place between Sunday night and Monday morning last on the North-Western Railway between Watford and Bushey. According to their invariable, but not very wise, habit, the railway authorities were at first inclined to pooh-pooh the whole matter, and it was not until several days had passed that the most important point of all, the fact that the substance discovered on the line was dynamite, was authoritatively settled. However, there may be said to be now no doubt about the bare facts of the matter. Some time between seven o'clock on Sunday night and the same hour on Monday morning parcels of a peculiar kind of dynamite were arranged by the side of the fast down line, connected with india-rubber fuses charged with gunpowder, and tipped with percussion caps to explode them on a train passing. Moreover, the spot chosen was at the junction of two rails, and the fishplates were removed, apparently with the object either of inducing a wrong idea as to the cause of the wreck which was planned, or else to make it certain that the train attacked should leave the line and fall down the embankment on which the railway there passes. The plot apparently failed either because the fuses were not properly adjusted, or because the excessive rain for the time weakened or destroyed the explosive power of the compound. But the remarkable thing is that not merely are the perpetrators unknown, but the exact train intended for attack is not known either. The infernal machine was discovered soon after the passage of the usual morning newspaper train. But this is a train which does not often carry many passengers, which carries no mails, and which cannot be supposed to offer any special provocation to vindictive feelings or any temptation to cupidity in its parcels of printed matter. It may seem odd that the time of deposit of the parcel should be so uncertain. But this is due to the fact of the North-Western having now four working lines of rails, instead of two, for many miles out of London. Between the late passenger trains of Sunday night and the early newspaper train of Monday morning nothing passed over the metals of one of these. But it was natural that suspicion should point rather to the Scotch and Irish mails overnight as the probable object of the malefactors.

At present there seems to be no idea of any important freight which these trains carried, and it is certain that, except Lord NORTHBROOK, who is not particularly likely to be the object of any secret society's vengeance, they carried no passenger of political distinction. It will of course occur to all reasonable people that, if documents or property of an important kind were sent at this time, the senders, whether private persons or the Government, would take good care, and would be right in taking good care, not to divulge the fact just at this moment, except to the police. Four hypotheses have been suggested up to this time, which may be shortly described as Robbers, Fenians, Nihilists, and Trade-Unionists, especially discontented railway servants. The Trades-Union Congress, sitting at Dublin, has expressed great indignation at the last suggestion. We are happy to think that not the slightest foundation for it has yet been shown or imagined; but the virtuous indignation of the Trades-Unionists is perhaps a little excessive. It is not so very long since they were guilty of acts precisely similar in kind, if less wholesale in extent, and the unblushing manner in which they still proclaim their determination to do the best they can for themselves, regardless of other people's rights and interests, is not calculated to conciliate public opinion. But there is little doubt that they have, on the whole, outgrown the murderous stage of their career, and murder in the present instance has, for them, no very definable object. The Trade-Unionist is now "tolerably mild," and to annoy a Railway Company he would hardly do his best to kill and maim an indefinite number of guiltless persons. The Nihilist hypothesis also has little to show for itself. The mere fact that a Prince of the Russian Royal Family is in this country on an official errand seems to have been enough for some imaginative persons. But, as there is no proof that the Grand Duke CONSTANTINE was, or according to any plan could have been, in any North-Western train near Watford on Sunday night or Monday morning, the hypothesis seems to be at least gratuitous. This cannot be said of the supposition of an attempt to rob, especially as the train aimed at was one of the mail trains. Unfortunately it did not need the Bremen explosion to tell us that there are men who would stick at nothing in the way of cold-blooded villany in order to obtain the chance of gain. The powerful appliances and inventions of modern science offer to such persons considerable temptations, and railway and steamboat travelling gives them abundant opportunities. It does not follow that anything particularly valuable can be traced as having been sent by any of the threatened trains. It would be sufficient, however, for the criminals in question to get wind of an intention to send it, which might afterwards have been changed. Such a trifle as a train blown up for nothing would not be likely to interfere with the plans of the professional thief of the superior kind. Dynamite is cheap, india-rubber tubing is not dear. The whole apparatus of the plot could not have cost a great number of shillings, and it is quite possible that the engineer had his eye on the return of a great number of pounds for his investment. The only thing against this hypothesis is the extreme improbability, in such a country as England, of getting off clear with the booty in such a case.

There remains the Fenian suggestion, and this certainly has the strongest *primâ facie* likelihood of the four. Not only had the Irish night mail passed overnight since the time the rails had been last examined, but it is not to be forgotten that the Irish day mail was due not very long after the platelayer HEATH discovered the parcel of dynamite "sausages" by the side of the line. It is notorious that the brotherhood have, under the favourable circumstances lately prevailing, been unusually active, and the blow struck is of a character quite consistent with their well-known tactics. Something, if not somebody, of importance, may have been going to Ireland; but it must be remembered that the true Fenian would be by no means determined solely by this consideration. The destruction in a dramatic manner of an Irish train, or of any train, would be sufficient for him. He has been
